We have received a communication concerning the article on these mines, in the Press of July 30th, from "Timothy," of Taylorville, Placer Co. We are obliged to condense as much as possible, and hence take up only the main points of the letter. Our correspondent makes the following statements, which are contradictory, he thinks, to corresponding statements made or implied in the article in question as to the location of the mines:—1st, the location, three miles from Leidersdorf's Wells, is not in the Burro Mountains, which are, at the nearest point, 25 miles distant; 2d, the Rio Grande is 175 miles distant; 3d, he has been all over these mountains, barometer in hand, and has never reached an altitude of 6,000 feet; 4th, there is not sufficient water in the neighborhood to subsist a command of 20 men. He has seen the float rock spoken of and "believes the mines are there," but would like, he afterwards says, if any mines have been discovered, to know where, as he has been all over the Burro Mountains. He has obtained in that range, gold and also copper.

The same authority from whom the previous article was obtained, makes reply, in substance, as follows: Calling the mines the "Burro Mountain" mines, is accepting the general name given by the miners. The mines are not in the Burro Mountains proper, but in the Pyramid range; but the title, Burro Mts., is often used in a general way for all of these ranges. The distance to the Burro Mountains proper from the Wells agrees with that to the "higher range," given in the article. The distance to the Rio Grande is greater than stated previously. It is given as 120 to 140 miles, perhaps more. The saw-mills are on the Membres River, at the distance previously stated. The altitude given was merely guessed at. There is sufficient water there, although our correspondent might not have found it.

In addition, two stage lines are now running to Ralston, one via Tucson, and one via Santa Fe. The stakes of the Southern Pacific Railroad do run through the town, whatever its altitude may be. Several thousand persons have visited the locality since the discovery; several thousand claims have been located; an application

has been made for a post-office; contracts have been made for the erection of mills; letters are being constantly received, etc., etc.

The special correspondent of the S. F. Bulletin, writing from Ralston City, under date of May 22d, gives the following corroborative statements: "The mines lie just three miles south of the Overland Mail and Stage Road, and are at the extreme northern end of the Pyramid range, where they lose themselves in the open, level country, 45 miles east of Camp Bowie, 70 miles southeast of Camp Bayard; by the sinuous road east of Tucson, 150; and west of Mesilla on the Rio Grande, 120."

If "Timothy" has the altitudes of Camp Bowie and other prominent points, we should be glad to have him give them to us. We are unable to obtain them here.

Colorado Progressive.

We think that it is almost the unanimous opinion of those who have visited Colorado, that while the mining interests have a bright future before them, the milling system has not been all that it ought to be.

We rejoice, therefore, when we find a local paper with sense and pluck enough to openly point out the defects,—usually a most thankless task. We commend the public spirit of the Colorado Herald. The paper deserves much praise for its action. By plainly showing up the enormous waste of precious metal, the careless, unprogressive method of milling, it does this territory an immense benefit, and any slight errors it may make while so doing are of comparative unimportance. Colorado has, all things considered, done very fairly, but such action will make it do better. The Herald shows that, at the lowest possible estimates, less than one half of the gold and silver is obtained from the ores in Gilpin county. Here certainly is room for improvement.

The concentration of ores is also a most important matter for Colorado, and has been recognized as such in some parts of the territory. The Herald, very properly, takes a stand on this subject. It also advocates especially Krom's Air Concentrator. Our opinion with regard to this machine has not been fully formed, as we have hitherto had no figures given, although we have seen the device do good work on one occasion. We give the summary of the results obtained in a number of experiments, according to the Herald.

The first column gives the kind of ore treated, the second, its assay value per ton, the third, the value per ton of the concentrated ore or "headings," and the fourth, that of the refuse or "tailings":

Kind of Ore.	Value of Ore.	Headings.	Tailings.
1. Tailings.....	\$1.00.....	\$ 6.85.....	\$1.75
2. Ore.....	27.50.....	75.00.....	7.25
3. Ore.....	35.00.....	83.43.....	13.72
4. Ore.....	25.37.....	94.93.....	10.99
5. Ore.....	12.50.....	37.50.....	3.62
6. Ore.....	45.66.....	163.42.....	9.05
7. Ore.....	18.80.....	110.13.....	4.27
8. Machine Tailings.....	1.99.....	2.25.....	2.56
9. ".....	8.62.....	9.28.....	7.28
10. ".....	4.27.....	2.07.....	3.23
11. ".....	9.05.....
12. ".....

Average value of 6 lots of ore.....	\$27.76
Average value of 6 lots of headings.....	105.26
Average value of 6 lots of tailings.....	8.15
TAILINGS.	
Average value of 6 lots of machine tailings.....	\$9.44
Average value of 6 lots of tailings.....	2.35

From ten to fifteen tons of ore were run through the machine, the lots being sent by the owners of different mines to be experimented on. The results are very favorable, although the first tailings from the machine evidently ought to be re-worked. The Herald thinks that, with a proper establishment and good crushing machinery, the whole cost of treatment would not exceed \$3 per ton.

We have read with interest the Herald's article, and, although we find them at times rather diffuse, and might not agree with the writer on all points, yet such a praiseworthy spirit has been evinced that we are willing to go a little out of our way to call attention to the course of the paper. We note, in this connection, that Mr. Stetefeldt has taken a lot of ore from Central City to chloridize in his furnace and then to experiment with by the chlorination process and by amalgamation. All these experiments are just what Colorado needs;—that the people there are really becoming alive to their short-comings, is one of the best signs of the times.

Mechanical Progress.

ICE-MAKING APPARATUS AT OXFORD.—Messrs. Siddeley exhibited a refrigerator which *The Engineer* declares was the greatest success of the Show. We quote from that journal: "These machines make use of the cold caused by the evaporation of ether in vacuo to produce ice. The chief faults of most refrigerators are, that constant attendance is required to regulate the supply of ether; and, that the loss by evaporation is the most serious item in the outlay. The first of these is obviated in Mr. Siddeley's machine by an ether regulator, with a peculiar arrangement of ball valve which retains the ether vapor, permitting only the condensed liquid to pass. With regard to the second, Messrs. Siddeley have had a machine similar to that exhibited at work in Liverpool night and day for more than eighteen months; the consumption of ether during this time has not exceeded the value of ten shillings. The refrigerator is a circular vessel, filled with circular tubes placed horizontally, through which a constant current of brine is pumped. The body of the vessel contains ether, which is drawn from it in a vaporous form by the ether pumps, which by this means reduce the temperature of the brine. The latter is pumped into the ice-box, and after having passed round the copper ice-moulds which contain the water to be frozen, flows back into the refrigerator. The ether, after being evaporated, passes into the condenser, a rectangular open vessel containing flattened tubes, between which flows a current of fresh water. It is by this means condensed, and after passing through the regulator above mentioned it returns to the refrigerator."

FIRE PROOF ENAMEL.—The N. Y. *Iron Age*, of Aug. 8th, has seen "a test specimen of a new enamel, pasted upon a piece of Gorman clay, which has remained intact in a fire completely melting the best American fire-brick, and partially the German clay, after an exposure of 48 hours."

IMPROVEMENT IN FLAT WIRE ROPES.—The *Colliery Guardian* makes mention of a rope recently patented by James Edge.—"The invention consists in so interlacing the sewing or tying wires, by which the several strands are secured together to form the flat rope, that the said wires are entirely inside the rope. Instead of the wires passing around the strands, forming the edge of the rope as usual, they pass under the adjacent strands, then across the rope in the interior thereof to the opposite edge and so on in a zig-zag direction through the whole length of the rope. In this way the interlaced wires are not exposed to friction, and the rope is without the uneven edge of the ordinary manufacture."

IMPROVEMENT IN GAS MANUFACTURE.—The *American Gas Light Journal* describes a new gas process, which it says is destined to come rapidly into use. It is now in operation in Saratoga, N. Y. At present crude naphtha is used. We quote: "Briefly, the oil or naphtha is put into a still and gradually converted into vapor by a steam coil. The vapor is thence conducted into a peculiarly constructed superheater, placed inside a clay or iron retort, set and heated in the usual way. There is one bench of three, each retort provided with a superheater. The vapor enters the rear of the retorts from the superheater, where it is instantly converted into a fixed gas, and passes into the standpipes, and so on to the gasholder in the usual way, excepting that no washing, scrubbing or purification is necessary; a simple tank and condensing coil being all. One bench of three will produce 5,000 cubic feet of gas per hour, prepared for distribution, of not less than 20-candle power, equal to 120,000 cubic feet per day of 24 hours. One bench of five will easily produce 200,000 cubic feet per day. The expense of labor is reduced to a minimum; only an engineer and one fireman being necessary. The entire process is so nearly automatic, that the manual labor actually required is a pastime, compared to the old process. There is no charging and discharging of retorts, with the hurry and din, and heat and steam, and sulphurous fumes. No troublesome stoppage of stand-pipes, or scaling and decarbonizing of retorts. No laborious and disagreeable purifying process. There are no bad odors, smoke or soot. Even the retort-house is so tidy, cleanly and quiet, that one could breakfast in it with a relish."

ANOTHER BULLET.—THE "TURTLESET" BULLET, externally resembling the Minnie ball, is a cylinder of lead with a conical head. On unscrewing the ball about midway there is discovered a cavity which is filled with dynamite powder, having an explosive force six times as great as ordinary gunpowder.—*Railroad Register*.

THE RUDDICK ENGINE.—This is illustrated and briefly described in the *Gas Light Journal*. Within the cylinder, are two piston heads rigidly connected by two pairs of rods. The connecting rod is attached at one end to one of these piston heads, and at the other to the crank, which plays in the space between the two pairs of rods aforesaid. All the parts so far named, are inside of the cylinder. The valve stem outside, is moved by a short arm properly attached to the crank shaft, between the two steam chests, one at each end of the cylinder. The advantages claimed are extreme simplicity, and great economy in space and weight.

FRENCH ARMY TELEGRAPH.—We find the following in the Paris correspondence of the *Engineer*: "The batteries are cased in felt and fitted with bungs, and sawdust is employed to contain the necessary salts and acids. The apparatus used is that of Morse, and it is placed in a box with the galvanometer and a lightning conductor to protect the operator during storms. The conductors are covered with gutta-percha, so that they may be laid on damp grass or even in water. The telegraph carriage is formed in two compartments, that in front, being like the *coupé* of a railway carriage, serves for an office, while in the after part it carries the reel of wire. In the office there is a table which supports the instrument, two accumulators, one for the batteries and the other for the signal bells, and a seat with places for two persons. The reel is supported by its axle in two parallel iron bars in the back compartment, so that the conductor is given out as the carriage proceeds on its way."

ELASTIC RAILWAY WHEELS.—The *Mechanics' Magazine* notices, without clearly describing, the invention of George Smith, of Belfast, Ireland, by which it is claimed the "hammering" of rigid car wheels upon the rigid rail is effectually done away with, and the disagreeable jolting, as also the wear and tear, prevented. We quote a short paragraph: "These improvements are obtained by suspending the axle from the top of the wheel by means of an elastic steel or iron hoop, which allows for any inequality in the rails, while at the same time, the tire is free to revolve independently of the body of the wheel."

THE INDIA RUBBER TIRE.—With reference to Thompsons' road steamer, the question now seems to be, whether the india rubber wheel tires will be durable enough to warrant the expense of their manufacture. At the Oxford Show, the flexible steel chain, with which they have for some time past been protected, was one day at the request of the judges, left off; and the strain being accidentally thrown for a moment upon one wheel, the tire suddenly snapped across, disabling the engine.

PITTSBURG AND SHEFFIELD.—The London *Ironmonger* says: "The Pittsburgh steel, both cast and rolled, is fully up to the mark of the best English—in fact, it is not only supplanting our produce, but in every shape of tool it is being largely exported to the European Continent. American bolts and hinges excel ours, and medium American cutlery of all kinds is cheaper and better than any manufactured here. We trust that our Sheffield houses will look to their laurels."

ERICSSON ON SOLAR HEAT.—London *Engineering* is publishing a series of articles by Capt. E. Ericsson on this subject. The first article is accompanied with a cut of his solar calorimeter. Our readers have seen some of the figures and estimates which Capt. Ericsson has made to show the possibility of utilizing the solar heat as a motor. We shall return to the subject when his solar engine comes under consideration.

Scientific Progress.

MUSCULAR CURRENTS.—Following, are some detached paragraphs from a communication by Becquerel to the French Academy some months since, from which we have before quoted. "The muscular current, is that which is produced when a non-oxidizable metallic conductor is put in contact, by one of its extremities, with the surface of a muscle of an animal recently killed, and by the other with a transverse section of the same muscle; this current passes from the interior of the latter to its surface. * * In a muscle in which two transverse sections have been made, it is recognized, by a very delicate galvanometer, that if a metallic connection is made between a point of a natural or artificial longitudinal section and a point of one of the two artificial transverse sections, a current passes from the longitudinal to the transverse section, or, within the muscle, from the transverse to the longitudinal section."

* * M. du Bois Reymond sought to explain the muscular current on the hypothesis that the muscular fibres are composed of minute plates superimposed one upon the other so as to form a voltaic pile. Matteucci has combated this hypothesis with the good reason, calling attention to the well known fact that when such a pile is divided the two surfaces opposed possess opposite electricities, while, if a muscle be divided, the two surfaces exhibit electricity of the same character. M. Liebig has decided in favor of the chemical origin of the muscular current. He thinks that in the muscle there is an acid liquid whose elements are imbibed and brought in contact with the serous fluid of the blood (alkaline). He supposes that the electric current is developed within the muscle in the same way as it is in the voltaic cell, charged with solution of potassa and nitric acid. Matteucci justly observes that, admitting the existence of the two liquids in the muscle, this does not explain the production and the constant direction of the muscular current from the interior to the exterior, since a third conducting body is necessary in order to establish it. M. Hermann admits the chemical origin of the muscular current. His experiments were designed to show that the exterior section of the muscle which is exposed to the air, and by consequence to the action of oxygen, is in a state of more active decomposition than the interior of the muscle. * * Numerous experiments have convinced me that the current has a physico-chemical origin."

* * I said at the outset that the cause of the irritability of the tissues during life, and for some time after, is unknown, and that the attempts thus far made to refer them to an electric origin, have proved fruitless. * * It is not necessary always to consider the electro-capillary currents as primitive forces of living bodies, since these only act when the bodies are created—their organs formed. These are the effects which become the causes of respiration and nutrition of the tissues. These phenomena cease with life, when the tissues lose irritability; the pores are then obstructed by the coagulation of the blood; the electro-capillary phenomena cease; all the organic elements are then released to the action of the chemical forces which end by destroying every trace of organization."

VOLUMETRIC DETERMINATION OF CHLORIDE OF IRON.—A. C. Oudemans, jr., proposes the following method for the analysis of chloride of iron that may contain a considerable excess of hydrochloric acid. Add to the iron solution one or two drops of a solution of the oxide of copper, and thereupon sulphocyanide of sodium until the liquid becomes dark red. A graduated solution of hyposulphite of soda is then cautiously admitted from a burette until the color disappears. The author assumes that the copper salt is first reduced by the hyposulphite of soda, and that the suboxide of copper then reduces the salt of iron. —*Jour. Ap. Chemistry*.

TRANSPARENCY OF GALENA.—L. Henry mentions the discovery by him, that galena in thin laminae is transparent. The light transmitted is, according to him, of a brownish-yellow color. Several other minerals of similar chemical composition, the sulphides of Arsenic and of Mercury (auripigment and cinnabar) had been known to possess this property, but neither possess metallic lustre, so that to the eye there is nothing to betray their metallic character. With Galena, the case is different, its lustre is characteristically metallic, and is one of its distinguishing properties.

POLLEN IN DIFFERENTIATION OF SPECIES.

The *Bowdoin Scientific Review* gives an abstract of a paper by Chas. Bailey in the *Microscopical Journal*, on the aid which will probably be furnished by the pollen in distinguishing allied species of plants. The author notes four points in one or the other of which the pollen grains may differ,—form, dimensions, markings, and color. In regard to the first-named, we quote: "It has long been noticed that certain types of pollen are characteristic of the natural order to which the plants which produce them belong, as, for instance, the peculiar pitted polyhedral pollen of the *Caryophyllaceae*, the spherical spiny pollen of the *Malvaceae*, the large triangular pollen of the *Onagraceae*, the peculiar pollen of the *Coniferae*, or the elliptical pollen of the *Liliaceae*, and other monocotyledonous orders; in fact, most orders possess a type sufficiently marked to be characteristic of each. This statement, however, must be accepted with limitations; the *Compositae*, for instance, have three or more well-marked types, represented by the beautifully sculptured pollen of the *Chalcid*, the minute oval spiny pollen of the *Asters*, *Calendulas*, *Cacalias*, etc., and another form wholly destitute of spines, as in the *Centaurea scabiosa*. There are, besides, other natural orders where similar variety occurs. But differences of form are met with in plants of the same genus, by which the one species or the other is readily marked off by its pollen; thus the pollen-grain of *Anemone sulphurea* is roundish, but that of *Anemone montana* is elliptic; the pollen of *Aronicum Duronicum* is much more elongate than that of *A. scorpioides*; and while the grains of *Ranunculus phitontis* are round and yellow, those of *R. platanifolius* are elliptic, white and smaller."

THE COMINO LIGHT.—"It would be a curious triumph of science if we are to succeed in the manufacture of illuminating gas by carbonizing the hydrogen, and thus dispensing with the old methods of the distillation of bituminous coals. This consumption is not at all improbable, and the time is not far distant when coal will be distilled for its benzole, naphthalene, anthracene, and tar, and not as a source of illuminating gas. The synthetical method of putting hydrogen and carbon together in just the proper proportions to give us the purest and strongest light, will probably take the lead of any other process now practiced. As soon as we have oxygen and hydrogen in unlimited quantities and at reasonable rates, we shall have two most important agents added to our stock, and this result appears likely to be attained before the lapse of many months."—*Jour. of Applied Chemistry*.

CHLORINE ON ALCOHOL IN SUNLIGHT.—G. Streit and B. Franz passed a current of dry chlorine gas into absolute alcohol with a view to the preparation of chloral. The current of gas being lively, the temperature of the alcohol rose soon to 155° F., where it remained constant. During this time a beam of sunlight accidentally struck the flask which contained the alcohol. An immediate detonation took place, which continued under the influence of the light, the gas bubbles exploding with a weak report and a flash of light as soon as they entered the alcohol. The light reached in several cases two or three inches up into the connection tube. The alcohol blackened at the same time, depositing after a while a black powder, probably carbon.

ANTHRACENE.—This hydro-carbon is obtained from the dense portions of coal tar, by repeated distillation, pressure, recrystallization from benzene and sublimation. If the anthracene has not its proper melting point of 210° to 213° it must be recrystallized until it melts at this temperature. Thus obtained, it is in crystals, to which a bright yellow coloration tenaciously clings. They can be freed of this however, by sublimation at the lowest possible temperature and subsequent washing with ether; or by bleaching a solution in hot benzene by direct sunlight. In the last case the anthracene separates on cooling in colorless crystals, of a superb blue fluorescence. These crystals are tabular, smaller or larger according to the degree of purity, and belong to the monoclinic system. If colored at all yellow—the coloring substance is chrysogene—the beautiful blue fluorescence above alluded to, is not seen upon them. Anthracene is soluble with difficulty in alcohol and ether, easily in oiling benzene. It melts at 213°, and distills 360°. —*Jour. Frank. Institute*.

Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

California.

ALPINE COUNTY.

STRUCK IT.—*Miner*, Aug. 13th: The Schenectady struck the Tarshish ledge in their lower tunnel on Wednesday at a distance from the month, five feet from the point laid down by survey—850 feet. The lode is identical with that in the upper works. A drift is to be run along the casing northerly and connection made by winze with the upper works.

LEVIATHAN.—After investigation of matters, the London owners, Dorset and Parkins, came to the conclusion this week that change would be healthy. They paid off all hands and are considering, in connection with Prof. Rickard, the course to be pursued.

MORNING STAR.—Rumor has it again that the mine will start up with a full force.

The *Chronicle* learns that the lower tunnel in the Leviathan will be run 300 feet further by contract.

AMADOR COUNTY.

NEW MINE.—*Dispatch*, 20th: We learn that a quartz mine has been discovered east of the Mahoney, near Sutter Creek, by a party of Austrian miners. They have a shaft down 50 feet, with favorable indications of a rich lead.

KENNEDY.—*Ledger*, 20th: The company have their shaft down two hundred feet, and are running through a vein seven feet wide, very rich in gold and sulphurets.

BIG YIELD.—The Marklee mine, cleaned up ninety-seven tons of quartz from which they took over seven thousand dollars. The vein is now five feet wide, and the shaft down two hundred and ten feet.

CALAVERAS COUNTY.

ITEMS.—*Chronicle*, 20th: Mining in Lower Rich Gulch is pushed forward with vim; Palomo and Alexander mills never stop except for repairs; Garland's chlorination works will be ready in a few days. Monitor District quartz and gravel, claims are vigorously worked. Paul & Co. are sanguine. Gleason, at the Junction, has run his incline 220 feet; the bedrock is hard. Shaw's hydraulic is "tearing things." Stockton ridge holds out, but begins to look weak. Brackett & Co. are taking out good pay; the gravel cement has to be crushed before washing. The Union Shaft claim is good for \$5 per day to the hand for years. Lewis Bro. mill will be completed in a few days. Burr mill, at Railroad, is constantly employed on custom work. Chilenois struck rich diggings above Whiskey Slide last week. The mill of the French Co., at Rich Gulch Flat, has shut down for repairs.

MACHINEERY.—The engine, boiler, pumps and hoisting gear formerly at the Palomo, are being removed to the Tische mine in Mosquito Gulch. A recent crushing of rock from this mine yielded \$92 per ton.

EL DORADO COUNTY.

QUARTZ.—*Placerville Democrat*, 20th: E. B. Morey has opened a new lead, northwest of Grizzly Flat, and last week cleaned up \$850 from 30 tons of rock. The lead is two to four feet in width. Mr. M. was offered \$2,500 for his claim before he crushed any rock, and now refuses \$4,000.

EL DORADO.—*Cor.* of same: The failure of the "Eureka Ditch," which annually occurs at this season, has dried up placer mining. Whatever surface mining has been done so far is merely prospecting, at an expense of 60 per cent. of the returns, owing to the exorbitant charges of the ditch companies.

INYO COUNTY.

KEARSE.—*Independent*, 15th: We visited the mill last week. Everything is in complete order. They are running but one-half the battery—five stamps—while waiting for quicksilver. Pans and eatlers are abating with bright amalgam, the strainer was full, and any quantity of the stuff was lying around, waiting for the retort. In the Summit mine, two hands are drifting in a 20-inch streak of pay ore. In the main mine of the Co., two are drifting at a depth of 1,000 feet. In all, some 17 hands are employed.

BULLION.—*Kearse.*—The Co. shipped, per Wells, Fargo & Co., last week, 4,350 ounces.

BULLION.—*Belshaw.*—Belshaw, at Cerro Gordo, is running out daily 100 to 120 bars. Since starting up on this run he has piled up 1,215 bars of lead, weighing 109,350 pounds.

ECLIPSE.—The mine is actively worked. Everything is being placed in order for the reception of the steam-stamp mill, started some time since from England.

DEEP SPRING MINE.—We were shown,

a lump of fine hullion weighing 250 ounces, the proceeds of two tons of ore from the San Juan mine. A. B. Paul is operating there with his new Electric process with a fair prospect of success.

PLACER COUNTY.

ST. PATRICK.—*Herald*, 20th: We learn that a new engine arrived at the claim on Wednesday, to be placed in connection with complete hoisting works, and that work will be pushed vigorously by the new owners.

DENY IT.—The two men charged with finding the 106 lb. nugget containing 97 lbs. pure gold, called on Thursday and denied the soft impeachment.

STRUCK THE LEAD.—A short time ago the Buckeye mine, near Ophir, was incorporated; stock, \$100,000. The work was commenced in an old shaft. We learn that at a depth of seventy feet the workmen have struck what is supposed to be the main ledge, which shows rich in gold.

PARAGON.—This mine, the famous Dewey claim, is now worked 3,500 feet from the mouth of the tunnel. The deposit is a body of dark cement, one hundred feet from the bed rock, and two to three hundred feet below the top of the ridge which it crosses northwesterly from the Middle Fork of the American, at Bath—toward or beyond Shirt Tail Cañon. For an average width of three hundred feet it is uniform in thickness, about four feet. For the full distance worked it has an exactly horizontal position. The pay is so regular that before making one of the fortnightly clean-ups, the number of car-loads taken out being known, the owners can estimate within a fraction the return. The Paragon is now held by two persons, Messrs. Wheeler & Breese, who work a splendid 20-stamp mill for crushing their cement. For four years the monthly yield has been scarcely ever more than one or two hundred dollars under or over \$9,000, or from \$50,000 to \$60,000 per annum clear profit.

PLUMAS COUNTY.

ITEMS.—*Quincy National*, Aug. 20th: McNeely & McBeth, at the head of Rich Gulch, cleaned up \$1,200 for one month's work. Bryan & Boston, near Marion Flat on North Fork, are working 14 men. Their claim pays \$15 per day to the hand. Orton, Gusette & Bruer at Cariboo, have struck the old Emigrant Lead and have big prospects. Joe Hickman has ground enough stripped to last two years. Benham & Co., at the mouth of Butt Creek on the North Fork are cutting a race to drain the bar and are making good wages while doing so. The old Dutch Hill Co., are doing well. Above 12 Mile Bar, Merseur, York & Co. have about got their river claim drained. They have been trying for five years. Sheerer & Co.'s claims at Ding Bat Flat have paid well, so have the claims of Cap. Corser at Rich Gulch.

UNION.—We understand that further developments show this newly discovered ledge to be of immense value. The lode is fourteen feet wide, and shows free gold all through.

NEVADA COUNTY.

PENNSYLVANIA.—*Gazette*, Aug. 19th: The mill commenced crushing rock from the mine on Wednesday, after having been idle for years. We understand that the company have out over 100 tons.

EUREKA.—*Grass Valley Union*, 17th: This mine had no other melting yesterday. The yield for eleven days, including Saturday, was \$27,000. This does not include any returns from sulphurets.

MUTUAL.—Same of 18th: This mine, near Graniteville, is on what was formerly known as the Jim Ledger and is proving a success. We saw yesterday a lot of gold, valued at \$5,000, taken out in twenty-one days by five stamps. The Mutual has been doing this thing for a year or two.

ALLISON RANCH MINE.—Same of 19th: The manager has determined to put up a new five stamp mill.

GREENHORN.—Same of 21st: Seventy-four tons of rock have been crushed, and the yield was \$2,023.35, or 28.90 per ton. The mill, owing to the scarcity of water, has only been run five hours a day, and there is now on dump 60 tons of rock. The shaft is down 70 feet below the tunnel, and in the bottom the ledge is six feet thick.

DRIFTING IN GRAVEL.—*Transcript*, 21st: Edmonds & Lord, near Washington, finding the low water season too short to work the gravel in the bed of the South Yuba, have concluded to drift it out. It is very hard and very little water seeps through. Large prospects have been obtained on the bed rock. They first sunk a shaft on the bank of the river to a depth a little below the bed rock, and run a tunnel thence to a point under the middle of the stream, when they raised up into the gravel which they have just reached.

BED ROCK TUNNELS.—Same of 23d: Two

will be commenced at Blue Tent this week, one by Kellum & Co., in the South Yuba claims, and the other by the Last Chance.

SAN DIEGO COUNTY.

JULIAN MINES.—*Union*, 18th: The new discovery, the Helvetia, has attracted great attention. The rock is said to be very rich. The McMechan mill, now crushing some of it, is running steadily. The Cotton mill is also running without intermission. They commence to-morrow on 100 tons of rock from the Owens mine.

SIERRA COUNTY.

GOODYEAR'S BAR.—*Cor.* of *Messenger*, 20th: Ross and Reynolds, of Rantededler, are progressing finely with their claim. Killbride & Co. are doing well. Tym & White have flumed the river at the lower extremity of Texas Bar. They have rigged up pump and derrick and will be on the bed-rock in a few days. Craig & Hulmes are hammering away in the Old Exchange. Perry & Thomas have resumed work in the Empire.

GOOD TAKE.—The other day some Chinamen found in the Middle Fork of the Yuba, a chunk of gold valued at \$180.

SAN BERNARDINO COUNTY.

CLARK DISTRICT.—*Guardian*, Aug. 13th: A large amount of property has changed hands, and there will be a large population in a few weeks. The mines are in the northeastern part of this county, 75 miles from Camp Cady.

Same of 20th, says: The Pinte Co. has been organized with a capital of \$5,000,000, for working some of the rich mines of Clarke District. The ores yield thousands of dollars per ton. Last week 90 sacks were shipped to San Francisco for reduction. At present there are only 300 miners, but numbers from White Pine and other places are flocking thither. The region is modestly well watered and timbered. Johnny Moss has made arrangements in San Francisco for a mill.

SISKIYOU COUNTY.

PATTERSON CREEK.—*Yreka Union*, Aug. 17th: The Creek is attracting much attention. John Stewart, Dick Churchill, Dick Gamble and others, have claims there. It is believed that there will be a hundred miners there the coming winter.

PIT RIVER.—On Monday Mr. Cottrell, informed us that there is considerable excitement in regard to the newly discovered mines, but gives it as his opinion that they will not prove of much value.

TRINITY COUNTY.

QUARTZ.—*Journal*, 20th: Several specimens of gold-bearing quartz have been during the past week, taken from ledges in this vicinity. One piece from Brown's mountain, contained gold which could be seen with the naked eye.

GOING AHEAD.—The trial shaft is down thirty feet.

Arizona.

ITEMS.—*Prescott Miner*, Aug. 6th: In the placer mines at Big Bug, the rain has increased the water in the creek, and miners are taking out \$4 to \$10 per day. The Eureka ten stamp mill in Walker District, was sold to C. C. Bean. It will commence crushing as soon as it can be repaired. They are running arastras in the Bradshaw District, with good results.

Colorado.

ITEMS.—*Central City Register*, Aug. 17th: The Reduction Works of Cash, Rockwell & Co., in Chase Gulch, are a complete success, and are running to their full capacity. The new Smelting works above Black Hawk, are approaching completion. The Gregory second lode, is being peopled with miners. Three cords of Stubtail ore yielded in Mather's mill, 19 ounces. Mr. Beach has leased the North Star Co's mine on the Illinois lode. Rollins & Co. showed us \$70 in gulch gold from their claims on North Clear Creek. They are making a half ounce per day to the man.

ITEMS.—*Herald*, 17th: Prof. Hill paid six hundred and thirty dollars for a ton of "Guthrie" ore, the other day. Specimens of Cariboo ore, recently assayed gave \$9,000 per ton. Sukey Lode Co., Summit county, have been making silver for the last four weeks. Their capacity is three tons per day—the ore averages 36 ounces per ton—and they can treat it at a small profit. On the Prize lode, the shaft is 325 feet deep, and a drift has been started from the bottom, which in the first 12 feet has yielded three cords of the best stamp mill ore and eight tons of solid smelting ore.

CLEAR CREEK.—William Brown, discoverer of the Brown Lode, has found a large deposit of three hundred ounce ore, and claims it as an eastern extension. The vein is 18 inches wide. F. X. Fitzpatrick is taking out big pay. The Womack & Seaton claim, continues to yield very rich ore.

The second class is worth \$150 per ton. Stewart's new works have started up.

GRAND ISLAND DISTRICT.—The last "big thing" was discovered a few days since, back of Cariboo City, by Wm. Warner. The surface quartz assayed \$1500 to the ton, but that taken out yesterday is richer than any previously found in the district. This lead created quite an excitement. At a depth of seven feet the pay vein is twelve inches wide, with six inches almost wholly composed of brittle silver.

The Cariboo mine is improving. The last load from the drift gave \$300 to the ton. The crevice has widened to 2-1-2 feet.

Spencer, Morkhart and Fairburn have sunk the Unexpected lode 27 feet, and are taking ore from the "Columbia." Mr. Cutter will put up smelting works at once. The Boulder County lode has a 2-1-2 foot crevice, one side of which is rich in gold, and the other richer in silver. As a greater depth is reached, the gold seems to be running out, and the silver increasing. In much of the ore gold has been found associated with large flakes of silver. The highest assay yet obtained is \$12,000 per ton. No ore has yet been treated, for want of a wagon road from the mine. The road is now completed. Fuller's 850 feet has been hauled to Cutter for \$8,000; Conger's for \$20,000. The crevice on the Trojan is 2-1-2 to 4 feet wide, and shows both gold and silver like the Boulder, of which it is thought to be an extension. The Sovereign People lode at a depth of 18 feet has a pay vein 17 inches wide, which will yield \$300 per ton. Nat. Edwards is working an extension of this. John Baker has discovered several valuable lodes in the district.

Idaho.

SNAKE RIVER MINES.—*Statesman*, 16th: There is a report of new mines at the foot of the Big cañon, above the Owyhee ferry. Several parties started for that place last week, and more are going.

PLACERVILLE.—*Cor.* of *Chronicle*, 17th: Water has become so scarce in this part of the basin, that all mining has ceased except in the beds of creeks. Granite Creek is the best quartz camp in the northern mines. Sufficient quartz has already been discovered to support the entire basin, and discoveries are made each week of quartz as rich as can be found anywhere.

Montana.

PILGRIM BAR.—*Helena Gazette*, Aug. 15: Boss Blair made a clean up on Sunday of \$3,500 as the result of a seven days' run. Holcombe, Beery & Co. cleaned up \$4,000 for a week's run; and Catching & Co. made a "right smart" clean-up. Water is decreasing.

ITEMS.—Miners at Boulder are all at work. Bohm & Co. had a gold brick of one thousand ounces cast yesterday. The shipments of this firm for July amounted to \$248,730. Tom. Pounds and Frank Green made a clean-up on Carpenter's bar, near Blackfoot City, this week, of \$10,000, from their bed-rock flume. A miners' meeting, at Oro Fino, appointed a committee to demand of the flume company in Tucker's Gulch that they turn back into its natural channel the water of Oro Fino.

CEDAR CREEK MINES.—In Sunrise Gulch twenty claims average \$7 a day to the hand. Forty claims have been recorded. In Bear Gulch, six strings of elucies are running. They get 25 cents to the pan. In Freeze-out Gulch, three dollars and twenty-five cents has been obtained from a single pan of dirt on discovery, and twelve to forty-five on Nos. 15 and 16 above. The gulch is one and one-half mile in length. Snow Shoe, Prospect and Freeze out all head together. Prospect Gulch is paying over wages. On Snow Shoe, claim No. 9 has paid \$200 per day, with four men at work. In Lost Gulch, six companies are running drains. Burmeister, Sweeney & Co. are 18 feet down with their drain, and are sinking a shaft. They have obtained 50 cents out of one pan and \$1.10 out of another.

ROCKER CITY.—*Cor.* of *New Northwest* 12th: Nothing has occurred except the arrival of several hundred Chinese, who have bought or leased nearly all the ground in the gulch. Wolverton & Co. sold out for \$4,500, C. Hawkins for \$800, and several others at high rates. There are now only three companies of whites, and some few hauling dirt from dry diggings.

HIGHLAND.—Knahe, assayer, says the ore of Beck & Patton assayed only \$410.93 per ton. The higher figures reported were for a bullion assay.

SILVER BOW.—Geo. McCausland, Mike Moran, Levi Russell and Chas. Warren, in the gulch two and a half miles below Silver, sunk a shaft, struck bed-rock at ten feet, and got \$2.20 to the pan on bed-rock.

They will commence sluicing next week. About 4,000 feet of the gulch has been taken up already.

GERMAN GULCH.—There are 60 men working. The water is falling, and all are now cleaning bed-rock with groundsluices.

PIKE'S PEAK.—Last week there were 11 hydraulic heads running, averaging \$900 each. The Rock Creek Lake ditch is carrying 1,600 inches of water. Dan Morris & Co. were shut off water on the lower bar last week. Timberlake, Hagan & Co. are taking out \$900 per week. The yield has been about the same all season. Walker, on Saturday, sold a one-sixth interest to Mr. Brown, of Cedar, for \$4,000.

New Mexico.

BURRO MINES.—The San Diego Union of Aug. 18th, notes the return of D. O. McCarthy, Agent of the San Diego and Arizona Mining Co. He located 14,000 feet for the Co. which makes a total of 22,600. The claims have all been duly recorded. Shafts six feet deep and five feet wide have already been sunk on eleven of the claims. He also took up 2,000 acres of splendid agricultural land on the Gila, 30 miles from the mines, claimed the water in the river, located "Aztec" town site, two miles square, and organized the Gila River Railroad, Canal and Town Company, with a capital stock of one million dollars. The country is well supplied with timber. The mining region is represented as wonderfully rich.

The *Alta* of the 17th, gives extracts from a Ralston letter of July 22d. The writer says he is sinking an engine shaft on the Harpending mine, and found a seam of silver ore rich in free gold. Some Mexicans have erected small furnaces. Rich veins sixty miles north are reported. No trouble from Indians yet. *Town growing fast, but mines dull.*

The *Alta* of same date also gives a Ralston despatch of 10th, via Santa Fe 15th, from M. L. Powers, Supt. to Harpending & Co., stating that the district laws have been fully complied with in regard to their mines.

Nevada.

COPE DISTRICT.

ITEMS.—*Elko Independent*, Aug. 17th: Potosi rock, Bull Run, assays \$163 per ton in silver. Bullion from Cope this week, shipped through Wells, Fargo & Co., amounts to \$3,100. Total from June 4th, \$55,641. Same, of 20th, says: The Railroad Co. shipped, for Livingston & Co., 40 sacks of ore from the Blue Jacket mine. Eder & Co. shipped four tons from the Potosi and three tons from Mountain City.

BULL RUN.—The Porter ledge is famous. The company is taking out ore, and considerable quantities have been shipped to be worked. Seventy-five sacks went down last week.

BRUNO.—*Chronicle*, 18th: Mr. Rodgers has presented us pieces of ore from the Crysolopolis and Mountain King. These average specimens from the dump appear to bear a large proportion of silver.

HUMBOLDT.

PUEBLA.—*Register*, 20th: Mr. Weir intends to put up smelting works soon.

GALENA.—The Butte mine is looking better than ever. The Co. take out 20 to 30 tons of shipping ore daily. Avalanches have been leased to San Francisco parties, who have erected steam hoisting works, and as soon as the shaft and tunnel is clear of water will put on 40 men. The White mine is idle. Mr. Knowles, who has a lease of the mine, has gone to San Francisco to purchase an engine. The Bena Vista started up a few days ago, and Wednesday cut a fine body of ore.

BATTLE MOUNTAIN.—*Telegram*, August 21st: The Co. shipped to-day by railroad, two cars of copper ore for Liverpool.

A portion of the Little Giant mine was sold yesterday to a party in San Francisco for five thousand dollars.

OREANA.—*Telegram*, 23d: Two smelting furnaces are running successfully at last. Two more will be started in a few days.

REESE RIVER.

BELMONT.—*Reveille*, 15th: The 10-stamp mill built at Northumberland a year ago has been bought by Mr. Canfield, who intends to erect it at Belmont.

BULLION.—Same, of 17th: Six bars, weighing 360 pounds, value, \$4,867, received here from Belmont last evening to be shipped.

MONTEZUMA.—Same, of 18th: The Faulkner mill, on the road to Yankee Blade, has been purchased by Dawley and McGlew, for Montezuma district.

MINERAL HILL.—*Elko Independent*, 17th: The new quartz mill at Manhattan will be running by the 20th. It cost \$70,000, and is one of the most complete in this State.

About 2,000 tons of ore are on hand, expected to go \$300 to the ton.

WASHOE.

CHOLLAR POTOSI.—*Gold Hill News*, Aug. 20th: Daily yield 300 tons, two-thirds from the Belvidere section, balance from the north end of Blue Wing. Average assays, \$67. This mine shows the greatest amount of high grade surface ore at the present time of any on the Comstock.

YELLOW JACKET.—Daily yield 225 tons, from the 800 and 900-foot levels, of excellent grade.

SIERRA NEVADA.—This continues yielding handsomely from the north portion, and the mill runs well. Receipts for July, \$13,000.

HALE & NONCROSS.—Daily yield 225 tons, from the lowest level. The drift south of the shaft, in 100 feet, shows poorer ore. A raise commenced 50 feet south of the shaft to connect with the level above for air, is in good ore.

OCCIDENTAL.—The new mill will be ready to start next week.

SAVAGE.—Daily yield, 70 tons, from the lowest level. The bullion receipts show this to be lower in grade than that of last week.

IMPEDIAL-EMPIRE.—The cross-cut west at the 1,200-foot level shows barren. The ore in the winze is good, with spots of extra richness.

VIRGINIA CONSOLIDATED.—West drift from the 500-foot station of the new shaft in 585 feet. The rock is much harder. Five tons rich ore, sacked, was hauled to Reno, for treatment.

CROWN POINT.—Daily yield 50 tons, mostly low-grade ore from the upper levels.

GOULD & CURRY.—A body of ore developed within the last few days near the south line, promises well. The daily yield is 40 tons. Receipts for July, \$36,385 02.

OPHIN.—Considerable low grade ore found in the old upper mine.

BELCHER.—A small but good seam found in the 152-foot level drifting north.

SACRAMENTO AND MEREDITH.—The new mill is kept steadily running.

KENTUCK.—Daily yield 35 tons, from the upper levels, of low grade. Receipts for July, \$9,465 79.

CALEDONIA.—Hoisting through the Uncle Sam shaft will commence to-morrow or next day.

HOPE.—Daily yield 40 tons, milling \$25 per ton. Both mine and mills working well.

SEQUESTERED BLECHER.—*Enterprise*, 21st: The ore now averages \$27 per ton. Eight hundred tons accumulated on the dump.

SURRO TUNNEL.—The tunnel was in yesterday 1,450 feet. It is still in very hard porphyry. About eight inches of water flowing from the month.

VIRGINIA CITY.—*Telegram*, 22d: The gross yield for the past month in the Chollar-Potosi foots up \$140,020.

Telegram, 23d: Work was discontinued yesterday at the Kentucky Mine.

The Occidental was started up for the first time at noon to-day.

WHITE PINE.

ITEMS.—*News*: South Aurora is looking finely. A portion of the force has been dismissed, but work goes on. Big Smoky mill, which has been undergoing repairs, started up on the 17th. The Oasis mill at Shermantown, now the property of the Eberhardt and Aurora Co., started up on the 19th, crushing ore from the Aurora Consolidated. The mill is of 5 stamps, and in complete order. One bar bullion, value \$1,774, from Silver Wave mine, and two bars from Pioche, value \$2,500, were shipped to San Francisco on the 19th. Tom. Robinson discovered the McPachin mine near Monte Christo mill. It is 8 to 10 feet wide and assays of the ore show \$70 in silver per ton and \$20 in gold. Two men in one week placed on dump 20 tons. Six bags Ely ore shipped to L. L. Robinson, San Francisco, on the 18th, worth \$6,432. Mine owners held a meeting on the 19th, to consider the question of grading the price of hire in accordance to the worth of the laborer, instead of paying all alike for a day's work.

PLEMONT.—At the Big Smoky mill, we noticed the working of another lot of ore from this ledge. The weight was 2,800 pounds, and the pulp assay \$161 in silver and \$37.50 in gold. It was quarried by two men in nine days, and six to eight tons that will yield \$75, and fifteen to twenty ton that will yield \$20 left upon the dump.

FREIBERG DISTRICT.—Timmerman & Bassett have brought in 1,400 lbs. base bullion. Freiberg is 140 miles southeast from Hamilton, upon the road to Pahranaagat. There are six or eight companies working paying mines. Timmerman & Bassett have the only reduction works in the district. The Shonte ledge has been stripped 30 feet,

disclosing a continuous body of ore containing 50 per cent. lead and assaying in silver \$200 to \$2,000 the ton.

EUREKA.—The *Sentinel* of the 20th says houses are still going up. Goodwin's new furnace is almost completed. The furnace of the Consolidated Co. is progressing. The Macuevin and Dunne furnace is to be running in twenty days. The excavation for the new mill of Carpenter & Co. has been commenced, and parties are here with the intention of purchasing a site for a 20 stamp mill. The Littercup furnace is producing large quantities of rich bullion.

Grass Valley telegram, Aug. 24th.—The Hope Gravel Mining Co. struck a lead of very rich gravel last night on Alta hill. The gravel is in the new ground, is two feet and a half thick, and has been run in 25 feet. It prospects fifty cents to the pan. \$1,500 was taken out yesterday.

Lower California.

NEW SAN DIEGO.—*Telegram*, Aug. 24th. Gold dust is being brought in daily from the Lower California placer mines. The district extends over a large strip of the mesa lands and foot hills adjoining the San Rafael Valley. About \$2,000 worth of gold dust have reached this city during the past week.

Land Office Fees for Mining Claims.

DEPARTMENT OF THE INTERIOR.
General Land Office, July 25th, 1870.

Gentlemen: Information has been called for as to the fees to which Registers and Receivers are entitled for services in acting upon mining claims. The following is therefore communicated for the government for all concerned:

In the 15th Section of the Act of Congress approved July 9, 1850, "to amend an act granting the right of way to ditch and canal owners over the public lands, and for other purposes" it is declared "That Registers and Receivers shall receive the same fees for services under this Act as are provided by law for like services under other Acts of Congress."

Now, the mining Act is substantially a pre-emption law, as the occupant, under the local customs of miners, is the only person privileged to purchase, and an application for a patent under the mining statute assimilates to a declaratory statement in the case of entries under the general pre-emption law.

It is, therefore, proper to apply the provisions, as to the fees in general pre-emption cases, to the special pre-emptions under the Mining Act. Hence Registers and Receivers in the States of California, Oregon and Nevada, and in the Territories of Washington, Colorado, New Mexico, Arizona, Idaho and Montana, are entitled to charge applicants for mining patents, at the date of filing the diagrams or making the application, the sum of three dollars, being one dollar and fifty cents each to the Register and Receiver.

For taking testimony, either in the form of affidavits or in writing out the answers of witnesses, they are allowed a joint charge of twenty-two and one-half cents per hundred words, these being the fees specified in the Act of Congress approved 21st of March, 1851, "Amendatory of the Homestead Law, and for other purposes" (U. S. Statutes, vol. 13, p. 35,) which we assimilate to services as to mining claims.

Then the claimant has to pay the expense of surveying the claim and making a plat thereof, the cost of the publication of the notice in the newspaper, and five dollars per acre for the surface ground embraced by the survey.

Such are the items of expense incident to obtaining a patent for a mining claim, so far as the United States or its officers are concerned.

From the foregoing, it will be seen that the fees payable to the Register and Receiver by the mining applicant are:

1st.—\$1.50 to each for filing diagram and application.
2d.—22½ cents per hundred words for reducing testimony to writing, under the principle laid down in the 4th and 6th sections of the Homestead Act of March 21, 1851, should the applicant desire it taken down by these officers instead of by themselves or other persons in the presence of the land officers.

The other payments required of applicants for mining patents are:

3d.—To the Receiver, the sum of \$5 and \$2.50 per acre respectively, for lode and placer claims, is shown by the final survey, and
4th.—A deposit in favor of the U. S. Treasurer according to existing instructions, of the amount estimated by the Surveyor General to cover the actual expenses of survey, plat, and cost of publication of notice.

These are the only charges, fees, or emoluments which, by law or regulations, the Register and Receiver have any right to exact from the mining applicant, and none other must be charged or received under any circumstances.

You are requested to acknowledge the receipt of this communication, and to be strictly governed by the terms mentioned therein.

Very respectfully, your obedient servant,
JOSE B. WILSON, Commissioner.

Important Land Reclamation Enterprises.

The *Yolo Democrat* publishes a petition addressed to the Supervisors of Yolo county for the formation of a Land Reclamation District, embracing about 74,000 acres of swamp and overflowed lands in Yolo and Colusa counties. This step has been taken under the Act of 1868, providing for the reclamation of such lands. If the petition is granted, the land owners of the District described, of which there are over sixty known, besides several unknown, will ap-

point three Trustees to propose plans and estimates to carry out the project, in accordance with the provisions of the statute referred to. It is held that this land must be reclaimed, if at all, in one body; and that by a very moderate tax per acre, a perfect reclamation may be effected. In addition to the above we notice that another party of San Francisco people have located on a large piece of tule land near the mouth of Napa creek. They have been at work several weeks throwing up dykes, etc., required for the reclamation. Engaged in this labor are some fifty Chinamen, with white Superintendents. Over two miles of dykes have already been thrown up. This company have mapped out some 11,000 acres to reclaim. Not far distant there is another company making preparations to begin work soon. They have 13,000 acres located which they propose to reclaim.

New Incorporations.

The following have filed certificates with the County Clerk, San Francisco:

BANGEN G. & S. M. Co.—Aug. 16. Capital stock, \$75,000, in 1,500 shares. Trustees: L. Elkers, F. Dansonville, W. L. Campbell, J. J. Carter and J. A. Holdeu.

OAKLAND TRUST CO.—Capital stock, \$100,000, in 10,000 shares. Trustees: G. W. Dunn, B. F. Pendleton, J. P. Cogswell, G. C. Potter, R. G. Perkins, O. Lewis and B. Thompson.

HOLLY OAK PARK CO.—Napa Co. Aug. 23. Capital stock, \$100,000, in 1,000 shares. Trustees: A. T. Easler, Maurice Doro and W. A. Woodward.

WEHSE SAFETY BLASTING POWDER CO.—Aug. 24. Capital stock, \$250,000, in 25,000 shares. Trustees: G. Dussell, T. Lovy, C. Collischoon, P. J. Weber and A. Diland.

The following have been recorded in the Secretary of State's office, Sacramento:

GOLD RUN DITCH AND M. Co.—Placer Co. Aug. 10. Capital stock, \$121,000, in 121 shares. Trustees: W. J. S. S. Moore, J. B. Taylor, L. D. McClure and H. U. Brown.

ALBERTA CO.—Aug. 11. Object, real estate, fruit culture and wine making. Capital stock, \$150,000, in 1,500 shares. Directors: W. E. Brown, Dr. J. M. Frey, J. S. Friend, N. D. Bayon, Geo. W. Chesley, Wm. G. English and S. L. Wilson.

ST. PATRICK G. M. Co.—Placer county. Aug. 13. Capital stock, \$500,000, in 5,000 shares. Trustees: Geo. D. Roberts, W. H. Cronise, S. W. Lee, S. Hydenfeldt and J. W. Gashwiler.

YUBA GRAVEL M. Co.—Nevada county. Aug. 15. Capital stock, \$30,000, divided into 300 shares. Trustees: T. V. S. S. Moore, J. B. Taylor, L. D. McClure and H. U. Brown.

CENTRAL PACIFIC R. R. Co.—Aug. 22. Consolidation of the Central Pacific R. R., the California and Oregon R. R., the S. F. Oakland and Alameda R. R., and the San Joaquin Valley R. R., under the name of the Central Pacific Railroad Company.

ORASS VALLEY WATER CO.—Nevada County. Aug. 22. Capital stock, \$15,000, in 150 shares. Trustees: C. Conway, E. W. Roberts and L. P. Dorsey.

RURAL CALIFORNIA PUBLISHING CO.—Aug. 22. Capital stock, \$15,000, in 150 shares. Trustees: W. W. Hayne, W. R. Cluness and M. J. Kelly.

Meetings, Elections, Etc.

PACIFIC ROLLING MILL CO. Trustees: W. Alvord. (President), L. B. Benchley (Vice President), B. P. Bruener (Superintendent), D. O. Mills and A. Hayward. Secretary, S. I. C. Sweeney.

MEADOW VALLEY M. Co.—Trustees: F. L. A. Piche, H. A. Lyons, L. Maynard, I. Friedlander, T. Bell, L. L. Robinson, J. W. Gashwiler, D. Lako and M. Skelly.

PATENTS ON THE PACIFIC COAST.—To those of our friends who desire to keep posted upon inventions upon the Pacific coast we say, subscribe for the *SCIENTIFIC PRESS*, published by Dewey & Co., San Francisco, Cal., at \$4 per year. The opening of the railway across the continent has given to all patents much higher value, and all interested will and the paper above alluded to a valuable resource.—*Mechanic and Inventor*, Detroit, Michigan.

Farming and Gardening.

COMMUNICATIONS for this department are solicited from all parts of the Pacific States and Territories.

The California Silk Manufacturing Company.

We present herewith a view of the building now in process of erection, on block No. 210, near corner of Tenth and Railroad Avenues, South San Francisco, for the California Silk Manufacturing Co., where the company owns six lots of land. The structure, when completed, will cover an area of 50x125 feet. It will be two stories high, substantially built and fitted up with the most approved machinery for the manufacture of machine twist; sewing, embroidery and saddler's silk; also floss and organzine for weavers', trimmers' and manufacturers' use, as well as every other kind of twisted or thrown silk which may be called for by the San Francisco trade. The manufacture of dress silk will be introduced in time, unless the full capacity of the machinery and capital can be fully or more profitably employed otherwise.

The company's office has been established at 125 Sansome Street. The incorporated capital is \$50,000, divided into 500 shares of \$100 each. Some of our most prominent and energetic business citizens are among the stockholders, and in fact hold a majority of the stock. It is estimated that not more than \$22,000 will be required to put the factory in readiness for operation, thus leaving more than half the capital or \$23,000 for active working capital.

The Officers of the Company

Are M. G. Kennedy, President; James Dale Johnston, Secretary; P. H. Burnett, (President of the Pacific Bank) Treasurer; Thomas H. Purves, Managing Director. The Trustees are Harvey F. William, Michael Fennell, C. J. Pillsbury, M. G. Kennedy and James Dale Johnston.

The enterprising originators of this new industry may well feel pleased with having overcome all the numerous obstacles which looked so formidable at the outset of the undertaking, and we trust the business will prove amply remunerative to recompense them most handsomely.

Progress of the Silk Business in California.

This is only the third year in which California has attempted the raising of silk worms and cocoons as a business. The first year it was a most complete success, although but very few engaged in it. The second year the business was undertaken on a larger scale, and several accidents and two or three mistakes, such as are always incident to all new enterprises, were encountered, but no feeling of discouragement was engendered; on the contrary, the experience gained was considered of the highest importance. This year, great success has attended the business thus far. The mulberry flourishes, the eggs have hatched well, the worms have been healthy, and the cocoons are large and fine. Breeders, as a general thing, however, are devoting all their choice cocoons to the production of eggs, for which the demand is very large.

This branch of business is so profitable that but few cocoons and only a little raw silk will be produced, until by the extension of the business this branch of supply has been fully satisfied. It may therefore be reasonably expected that at least four or five millions of dollars—a sum equal to half our wheat receipts—will have to be added to our exports in this direction before any considerable quantities of raw silk can be produced in California. Until then, our pioneer manufactory will have to depend mainly upon Japan for its supply of raw material.

No business in the state now promises better for the future than silk, and the impression is irresistible that it must soon become one of the chief sources of the wealth of the state. Still there is much to be learned in the production of reeled silk. Most of our growers are as yet but novices in the business, and we have but few experienced reelers, and others must be instructed.

But little land or capital is required to embark in the business, while the cultivation of the mulberry is simple, and it will

grow almost anywhere. We have now an abundance of trees for propagation, which can be had at a fair price. The most of the work can be done with the cheapest kind of labor. The care of the trees and worm affords light and suitable employment for women and children, a class of our population, which is now almost destitute thereof. Silk culture will give variety to our crops; stimulate new branches of manufacture, and add vastly to our wealth at home and reputation abroad.

The business of producing the cocoons is one which may be profitably conducted on a small scale, and should form part of the occupation of our farmers generally throughout the state. Thousands of idle days may thus be turned to good account, and many thousands of idle hands may thus be provided with easy, agreeable and profitable employment.

The Future Silk Trade in California.

Europe now produces, in its raw state, silk to the annual value of \$75,000,000; while the production in Asia foots up to the enormous amount of \$141,000,000. France produces \$140,000,000 in value of manufactured silks, giving employment to half a million of adults. The result within the ready reach of California, with a population as dense as that of New England,

THE CALIFORNIA SILK FACTORY.

including the raw and manufactured goods, ought to reach an annual production at least of \$150,000,000 over and above home consumption; while every other branch of business would meet with a corresponding success.

There is no more remunerative business in the world than the production and manufacture of silk. All that is needed is the proper climate, population and capital. With the former we are abundantly blessed; population will flow in upon us as soon as our advantages are properly known abroad. As soon as we secure the population to produce the raw material and therewith the necessary skill, capital will seek employment without any special effort. Rich men without skill will not erect factories. What we now want is men of moderate means to take the initiative. Then the capital which is now swept from our banks to settle balances for silk importations from Europe and Asia, will find profitable employment at home. We trust the enterprise now being inaugurated will be but the beginning of what shall soon prove a successful effort to close up this ruinous drain upon our resources.

In view of the foregoing exhibit of the advantages of the California silk trade, the stock of the enterprising company now erecting their factory at South San Francisco, should be very acceptably received by our citizens and capitalists, and meet with a ready sale, the more especially as it is likely soon to command a rising premium.

A HEAVY COLT.—Mr. O. P. Moulton, of Harrisburg, writes us, under the date of Aug. 14th instant that he has a Rattler, Sucking Colt, (sired by R. Demark's Young Rattler,) which was then 4 months and 10 days old, and weighed 537½ pounds. The animal was weighed on the Warm Young Landing scales, in Alameda county. Can any one beat this weight?

BROOM CORN FOR THE EAST.—An experimental shipment of broom-corn for the East will be sent over the railroad in a few days. It is claimed that California-raised broom-corn is much superior to that grown in the Atlantic States.

Hints for Deep Cultivation.

While conversing a few days since, with Captain Grafton Hillman, who owns an extensive ranch about eight miles east of Stockton, and who entertains enlightened ideas of farming, the need of a more careful and thorough cultivation of our wheat fields came up, during which the Captain narrated the following incident, which he had employed to urge his enlightened ideas of farming upon the attention of a friend, whose ground he was at the time viewing. It appears that there had been a private road-way, which had been used by the public for several years, for a distance of half a mile through his neighbor's wheat field; but that year the road had been closed up, and the track plowed and sown with the rest of the field. The appearance of the growing grain upon this disused road was very striking. In the center of the track which had been trodden by the feet of the horses, the ground had never been much broken up, while upon each side, in the ruts, where the wheels had run, often cutting in

thorough cultivation. A careful record of the extra amount of expense thereby involved, and the increased yield realized would also enable him to arrive at a correct idea of the economic value of such cultivation. The cost of such or similar experiments are trifling; the benefits and information derivable therefrom are often of great value.

Palm Trees in Santa Clara.

In the court yard of Santa Clara College there are two fine fan palm trees, twelve years old, five feet in circumference and about seven feet to the first leaves, which are seven feet long. These plants appear to be at home in the open air. Their growth is step by step, just as the leaves are formed, and just fast enough to accommodate the new leaves, which always come out from the crown. Leaves over a year old lap down, and are removed.

There is also one *date palm* six years old, the crown of which is but a few inches high; the leaves are about four feet high. The plant makes a spreading, fern-like shrub, some seven feet over, and it bids fair to live and become a towering tree.

Olive and other Trees.

There are also at the above locality quite a number of olive trees, some 50 years old, which will average two feet through and twenty-five in height, with upright, half spreading branches. They are rather rough, straggling looking trees. This season the drouth and heat lighted the fruit, but they are said to be usually very prolific.

There are also pear and fig trees about the same age, rather rough looking, but healthy and fruitful.

Garden Profits.

Some idea may be formed of what good cultivation may do, from the following report of the product of a small patch of ground, in Newark, N. J. 90 feet by 60, owned and worked by Dr. Isaac P. Trimble, a well known horticultural writer and a thoroughly practical man. We give the general average of a season, substantially as reported by *Heath and Home*.

There are gathered, in their season, nearly all the vegetables known in that latitude, and several of the small and large fruits. He begins the year with salad and early peas, followed with raspberries of which he usually gathers a bushel; also a peck of gooseberries; a bushel of carrots; two months supply of blackberries; peas every day for three weeks; string beans daily for six weeks; beets two months; green corn ten weeks; Lima beans, two barrels; tomatoes and egg plants all summer; potatoes for a month; a bushel or more of green gage plums; five bushels of grapes, and not less than fifteen bushels of pears.

All this on about one eighth of an acre of ground, the value of which, in this market, would be somewhere about \$500 in gold. The doctor generally pays about \$20 per annum for labor and manure. He works the garden himself, mornings and evenings, going to New York every day to attend to business. His soil of course is excellent; but kept so by persistent, scientific and careful culture. Any man who owns a tract of equal extent near this city, with facilities for irrigation, may make as profitable use of his leisure as Dr. Trimble does.

CRANBERRIES IN GRASS VALLEY.—Mr. Marshall, a well known gardener in Grass Valley, whose garden is located on a piece of land some 200 feet above the level of Deer Creek, a few rods from which he is located, has an extensive bed of cranberries, now bearing fruit, fully half grown and doing well. Mr. Marshall does not irrigate his cranberries any more than he does his other vines or vegetables. The Grass Valley Union very pertinently asks: "If such things can be grown in the highlands of this vicinity what could be done in the marshes below?"

A Frenchman's View.

Bayard Taylor, in his last letter to the *New York Tribune*, describes a trip from the Salinas Valley to Gilroy. When at a point within twelve miles of the latter place he says: "The Los Angeles stage arrived, with two or three brown, dust-covered panting passengers, who considered the heat of San Juan a relief after that of the Salinas Valley. I took my seat beside them for the remaining twelve miles to Gilroy. One was a Frenchman from the Rhone, traveling in the interests of silk-culture, but also familiar with wine-growing. He scanned the country, as we advanced, with an eye to both forms of production. "Superbe!" he exclaimed, waving his hand over the valley, from Pacheco's Pass to the Coast Range! "incomparable! All this level land must be covered with mulberries—what do I say?—oranges, olives! Those mountains, to the very summits, will produce the finest wines in the world! Why, the whole population of France could be supported in California."

CULTIVATING TULE LANDS.—Much difficulty is encountered in cultivating these lands. Perkins, the seedsman, who cultivated eight acres on Sherman Island, according to the *Alta*, plowed four times, commencing with a depth of four inches, and going two inches deeper each time, so at last his plow cut down ten inches. After each plowing he let the land lie ten days to dry, then barrowed, gathered the loose tule and roots into shocks and burned them. This was in March and April, when the soil was damp, and the fire did not go beyond the shocks of dried roots and tule. The last plowing was done with two plows in a gang and a double team of horses. The land is in splendid condition, light, rich and clean. Those tule farmers who plowed only once last spring, have found out that they made a mistake. The crop is light and the tule has taken a new start, and threatens to be as hard to kill as before it was disturbed. Either burning or repeated plowing is indispensable.

WHEAT SHIPMENTS FROM OAKLAND.—Two ships have already been loaded from the Oakland wharf—the second one having completed her loading on Saturday last. The first ship loaded was the *Iron Crown*, for W. A. Halecomb & Co. of San Francisco. The wheat was received on ship board direct from the freight cars, thus involving the least possible handling and waste. The storage of wheat in this city, and the banding and rehandling consequent thereupon, greatly increases both the waste and cost—and all at the expense of the grower. Vallejo and Oakland have been made, by rail road facilities, the natural shipping points for the chief portion of the wheat product of the state, and will doubtless continue so for all future time.

A cargo of wheat was recently shipped from Vallejo to Oakland, instead of to this city, as usual, for transhipment to Liverpool. When wheat that cannot be shipped direct from Vallejo is sent to Oakland for foreign shipment, there must be something radically wrong in this city.

PROFITABLE HAY CROP.—The *Contra Costa Gazette* says that the Danekin Brothers have taken 240 tons of wheat hay from 60 acres of ground on their ranch, in the southern portion of Santa Clara, which they have sold in this city for \$16 per ton—netting, over and above expenses of plowing, seeding, cutting, shipping, etc., \$1,800, or \$20 per acre. In addition to this they are now employing the ground for pasturage, which will be worth to them some \$200 more.

SHEEP DYING.—A flock of sheep recently arrived from San Joaquin at some point near Haywards, and intended for slaughter for this market, have been attacked by some disease, of which 40 are said to have died in one day. Did the survivors find their way to the San Francisco market—and if so were they killed in a healthy condition?

What I Know of Farming—No. 33.

A Lesson of the Day.

Under the above head, Mr. Greeley gives some practical hints, touching present practices of farmers as affected, or indirectly affecting the character of our seasons. He first alludes to the common practice of denominating anything like exceptional seasons as "the hottest," "the coldest," "the driest," or "the wettest" season in so many years; when in fact there may have been several equally as exceptional seasons in any direction, within the time specified. Hardly anything is so easily forgotten as the extremes of temperature. Every summer has its "beated term" and its season of drouth, and nearly every winter has its "cold term."

As our country is more and more denuded of its primitive forests, drouths, longer and severer, must be expected. What our farmers have to do is to provide against them. "Those who plow deeply, fertilize bountifully, and cultivate thoroughly, need not fear them."

This latter fact has been abundantly shown in California the past season. We have yet to learn of the first instance where any one has materially suffered from drouth, who has cultivated his land as if in expectation of such an occurrence. We have instances all over the State, where luxuriant crops may now, or might have been seen a few weeks ago, with failure all about them—and yet both occupying lands in every way similar. Cultivation alone has made the difference.

Mr. Greeley speaks of the appearance of the crops in various portions of the Eastern and Middle States, where he has traveled the past season. He refers to fields of corn in the upper valley of the Hudson, which will not produce a bushel to the acre; and buckwheat blooming at an average height of four inches, that would not grow two inches higher; which, if properly cultivated, would yield 60 bushels of corn, and proportionally of grain—for this was not in a rocky, sterile region; but in a river interval of much natural fertility, which had been exhausted and not renewed. The great complaint was that they could not obtain fertilizers. In reply to the question,

"How shall we obtain fertilizers?"

and to the complaint that "We are poor; we can afford to keep but few cattle; Guano, Phosphate, Bones, Lime, &c., are beyond our means. Even if we could pay for them, the cost of transportation to our out-of-the-way nooks would be heavy. We cannot deal with our lands so bountifully as you do, but must be content to do as we can." To all of which Mr. Greeley makes answer as follows:

"No man ever lacked fertilizers who kept his eyes wide open and devoted two months of each Fall and Winter to collecting and preparing them. Wherever swamp muck may be had, wherever bogs exist or flags or rushes grow there are materials which, carted into the barnyard in Autumn or Winter, may be drawn out fertilizers in season for the corn-planting next Spring. Wherever a pond or slough dries up in Summer, or Autumn, there is material that may be profitably transformed into next year's grass or grain. In the absence of all these—and they are seldom very far from one who knows how to look for them—rank weeds of all sorts, if cut while green and tender, or forest leaves, gathered in the Fall, used for litter in the stable, and thence thrown into the yard, will serve an excellent purpose. Nay, more: I am confident that the farmer who lacks these, but has access to a bed or bank of simple clay, may cart 200 loads of it in November into an ordinary farm-yard, have it trampled into and mixed with his manure in the Winter, and draw it out in the Spring, excellently fitted to enrich his sandy or gravelly land, and insure him, in connection with deep and thorough culture, a generous yield of corn, even in such a season as the present. Dr. George B. Loring, the most successful farmer in Massachusetts, uses naked beach sand in abundance as litter for his 80 cows, mixes it with his manure throughout the Winter,

and draws out the compound to fertilize his clay meadows in the Spring, with most satisfactory results. Depend on it, no man need lack fertilizers who begins in season and is willing to work for them.

And yet once more:

From the hills which inclose this valley of the upper Hudson (and from ever so many other valleys as well), brooks and rivulets, copious in Spring, when their waters are surcharged and discolored by the richest juices of the uplands, pour down in frequent cascades and dance across the intervals to be lost in the river. There is scarcely an acre of that interval which might not be irrigated from these streams, at a very moderate outlay of work at the season when work is least pressing; the water thus held back by dams being allowed to flow thence gently and equably across the intervals, conveying not moisture only, but fertility also, to every plant growing thereon. I am confident that I passed many places on the upper Hudson, as well as on the Connecticut and Ammonoosuc, where 100 faithful days' work providing for irrigation would have given 100 bushels of grain, or 10 tons of hay, additional this year, and as much per annum hereafter, at a cost of not more than two days' work in each year hereafter.

Farmers, but above all farmers' sons, think of these things!"

Most of the above suggestions are quite as applicable to California as to the regions more especially referred to. Large values are sacrificed every year by the wasteful practice of burning the straw of our wheat fields. This practice, although strongly denounced by intelligent farmers, is still quite general. The objection that it will not decay is without foundation. One or two rainy seasons, at most, will effect its decomposition, if properly mixed with earth or muck; two or three will do the work, less properly, however, if merely thrown into heaps and left exposed to the weather. Of course a certain portion of the straw upon every farm should be stacked or boused for fodder and litter.

Mr. Greeley's suggestions about irrigation are capable of a wide application in this State. Already the construction of of comprehensive and extensive systems of canals have been suggested, and in some localities are being carried out. Many millions of dollars might thus be advantageously expended in this State. Let the farmers of California "think of these things!"

Raising Horses.

EDITORS SCIENTIFIC PRESS:—I wish, through your valuable paper, to make a few remarks on the subject of raising horses. The practice generally adopted in this country of raising the horse in large herds, necessitates another practice which, in itself, is cruel and pernicious. I refer to the practice of castrating when very young. The great majority of male colts are emasculated at the age of one and two years, and but very few, if any, at the age of three and four years, as should be the case with all, where the end sought is a good and serviceable animal.

It must be seen by any careful observer that very many of our gelding horses are lame from corns in the feet; and some so badly affected in that way as to render them almost entirely worthless. This is caused not so much from hard usage, as from want of strength and firmness in the hoof. It is well known, at least among medical men, that emasculation seriously interferes with the proper development of the bones, horns, hoofs, nails or claws, etc., of animals—that is to say, the shell of the horn or hoof; and where early emasculation is resorted to, the shell of the horn or hoof must of necessity be thin and weak, and of a soft, spongy texture, in consequence of the natural supply of sustenance being cut off before the animal is well advanced in his development.

Take, for instance, two male calves of the same breed; castrate the one at the age of two months, and the other at the age of, say two years, and see what a difference

there will be in their horns when full grown. The horns of the one castrated at the age of two years will be two or three times as heavy and strong—especially the shell—as that of the one castrated at the age of two months. This rule holds good with regard to the hoofs, nails or claws of all animals. Therefore, if a colt be emsonated when very young, or before he has attained the form of the stud, he will have, when fully grown, but a thin, light shell on the hoof, and that of a soft, spongy texture; and corns on the feet, after a very little use on hard roads and pavements, will be a natural consequence. Of course this rule would vary somewhat in different animals, as there is a great difference in the age at which they develop.

Nor is this all; for horses, when early emasculated, are rendered light and weak in the fore parts, as compared with that of a horse of the same breed, which has been emasculated, say at the age of four years, the two being full grown when compared, say seven years old. Moreover, being light and weak in the fore hams and shoulders, and therefore unable to stand the hardship that he might otherwise be able to do, the disease of the foot may, in some degree, be communicated to the fore limbs and shoulders, through the nerves.

A thorough-bred American colt should not be castrated younger than in the fall say October, after he is three years old. This gives him the advantage of the fall season in which the blood is most active in this particular, and it is nearly as well for him as though the operation was performed early in the spring, of the fourth year of his age; but it would be still better if he was allowed to run to the age of four or five years before being castrated. With Spanish horses, that develop very young, it is not necessary that they should run to so great an age.

Were my suggestions to be acted upon it would, with the practice of early training afford an opportunity to know something of the quality of the horse, and where he gave great promise, he could be kept for his blood; and we would have less geldings and more stallions, of the quality of Dexter, Topgallant, Rattler, Dutebman, etc. This must of itself be a very important desideratum. But I have extended this article to a greater length than I had intended. I had only hoped by introducing the subject, to elicit from some more able correspondent an article that would do the subject better justice. W.

COMMUNICATION RECEIVED.—On Battle Mountain District, from D. W. Will be published next week.

T. RYAN.—Scott Bar.—Your note and the box of minerals are received. Will be noticed further at the first opportunity.

A Century Plant in Bloom to be Placed in the Fair!

Among the many attractions at the forthcoming Horticultural Exhibition at the Pavilion will be a *Century Plant* in full bloom! This plant has just come into flower in the garden of Gen. R. W. Kirkland, at Oakland, by whom it has been generously presented to the Mechanics Institute for the above purpose. This specimen of the *Agave Americana*, is a most magnificent one. It stands fully thirty feet high, and will require a four horse team for its transportation. It is most opportune and fitting that this giant of the floral kingdom, native and peculiar to the Pacific Coast, should thus be at hand to occupy the post of honor in the first grand floral exhibition ever undertaken on the Pacific Slope. It will form the chief feature of the Exhibition, and will be examined with much interest and curiosity by hundreds of Eastern and European visitors, who have never yet had the opportunity of seeing this most wonderful plant in bloom. In anticipation of the great interest which will be elicited by its exhibition, we have had a careful and accurate drawing taken of it, which our engraver is now at work transferring to wood to be presented to the readers of the SCIENTIFIC PRESS on Saturday of next week.

GUESTS.—Wm. H. Seward arrived in the State on the 24th inst., receiving a cordial greeting. General Sherman has been invited by the Society of Pioneers to visit the coast and participate in the celebration of Admission Day, the 9th of September.

FRENCH CANTALOPES is a species of melon which has recently been offered for sale in this city by Bullett & Co., of the Pacific Fruit Market. The seed was imported by themselves. The fruit presents a very rough and uninviting exterior, but the pulp is delicious.

Santa Clara College.

The 19th Annual Commencement of the Santa Clara College, which took place on Tuesday and Wednesday, the 9th and 10th instants, has been, as usual, highly spoken of. The exercises were of the highest and most pleasing order. Want of space has prevented us from publishing the account thereof, which has been furnished by our correspondent, who was present on the occasion; but we give, below, the portion of his letter which gives a description of the new and elegant hall in which the exercises were held, together with some account of the surroundings and general character of the Institution, which, for the past year, has had enrolled upon its books the very large number of 218 students.

The New and Elegant Hall,

which has recently been erected on the northeast corner of the college block, fronting upon both Alviso and Franklin streets, is a substantial and elegant structure, of three grand stories, which raise the building in towering prominence. The outside massive, Roman, Doric and Ionic finish, gives the building a classic appearance, quite in harmony with its object, and in pleasing contrast with the quaint old structure that constituted the old college.

The hall, including the orchestra, stage, main floor and gallery, occupies the two upper stories, and will seat from 3,000 to 4,000 persons. It is most admirably arranged, and although it does not attract the eye with gorgeous display, still leaves an impression of grandeur, neatness and beautiful adaptability, that remains a finished picture in the mind. The hall is ventilated on the most approved plan, and lighted with the recently invented pneumatic gas, which was illustrated and fully described in our issue of May 14th.

The entrances are ample, the stairways wide, and the large, double swinging doors will admit a stampede without interference. Nothing essential seems to have been overlooked in the design and construction of this truly fine edifice.

The massive strength and completeness of this structure gives one a confidence, in spite of threatening earthquakes, in its stability and durability.

A Dinner

with the "Fathers" of the institution, to which a few of its friends were invited, was accepted by your correspondent. It was a most substantial repast, both in edibles and in mirthful spirit. Dyspepsia must be a thing unknown, where every visage gleams with cheerful satisfaction over the bountiful food so relished by health.

The Buildings and their Surroundings.

Father Messea, who has been seventeen years connected with the College, kindly showed us through the buildings and grounds, and took pleasure in answering every question propounded by us.

The Library contains 10,000 volumes, all select and valuable works, historical, political, scientific, etc.; and is being constantly enlarged. A printing office and a telegraphic office are supplied with materials for practical work.

The Laboratory is very complete, and looks quite as much like a place of business as of study.

The Museum contains many interesting specimens of natural history, fossils, shells, minerals, insects, birds, etc., all divided into natural orders, and grouped with great care and taste. Several pianos are provided for students of music, and drawing is also taught.

The philosophical apparatus is very complete, containing many rare and expensive instruments—some of the most modern and best approved.

A scrupulous neatness was everywhere observable. Every duty is regulated by the tap of the bell, from the rising in the

morning till the retiring at night. During hours of intermission the boys are allowed full liberty on the commodious play grounds, where we saw them in the full enjoyment of the athletic sports, so worth the privilege of enjoying and remembering.

We were shown into a room where the clothing of each student is neatly put away upon shelves, numbered to correspond with the names. The laundry is in convenient proximity. Connected with it is a steam engine of 18-horse power, employed for laundry work, pumping water and sawing wood. The College grounds are tastefully laid out and many fine plants and trees are cultivated, a further notice of which may be found in another column, under the head of "Palm Trees in San Jose."

The college owns quite a fine orchard, vineyard, vegetable garden, and have a swimming pond and boat, artesian wells, etc. Indeed nothing that is conducive to health and convenience seems to be lacking. Ample provision is also made for the sick, and every needed comfort is provided. One of the finest views to be obtained of the Santa Clara Valley is from the cupola of the old College building. Wonderful valley! Beautiful beyond the power of description—where nature has lavished her richness and man has planted the standards of progress and civilization!

Common Schools.

The Santa Clara College is a credit alike to its founders and to the State. Such institutions are too few. But while we admire all that we see here of material and natural and moral worth, we must still claim the palm for our Common Schools, the real glory of our country and the honor of our people! The education of the masses is the strength of our civilization, the foundation of our national greatness, our liberty and our advancement. And the common schools of this region are models of excellence in every essential thing.

STEWART'S WORKS AT GEORGETOWN, COLORADO.—The following items with regard to the old and new works we condense from the *Colorado Register*. The old works consisted of six stamps, two reverberatory furnaces and the accompanying machinery. In 18 months, 78,028 ozs. of silver hullion were produced at a given coin value of \$75,004.90. The entire yield is said to have averaged 80 per cent of the fire assay. Capacity of works, 3 tons per day; charge for reducing ore, \$55 to \$60 per ton; capital invested, about \$35,000. Two Arrey shaft furnaces, for chloridizing, are now to be put up, one on Chicago Creek and one on Snake River, for the Chenango Co. Capacity of each, 20 tons daily; cost of treatment, not over \$15. The present price of working ore is about \$30 per ton, with a prospect of a still further reduction in prices.

On the 10th inst., as the result of flaws in the gearing, the cage in a coal mine near Pottsville, Pa., was dropped 225 feet, and with it 12 men. These were plunged into the sump and buried under the hoisting rope. Result: 10 dead and 2 badly wounded. The manufacturer of that defective gearing ought to be interviewed by state officials; likewise the proprietor of the colliery.

TELEGRAPH POSTS.—The wood of telegraph poles put up in Kentucky withstood the elements as follows: the chestnut rotted first, the cedar next gave way, while the locust, at the end of five years, was nearly sound.

ACKNOWLEDGEMENT.—We have received from the Salt Lake City Museum a box of specimens of minerals, cereals and home-made articles, together with several pamphlets. We shall speak at length concerning these next week. Our thanks to the sender.

Academy of Science.

The regular monthly meeting of the society was held on the 15th. Several names were proposed for membership, and a number of contributions to the cabinet were received. A number of pamphlets were also presented to the society.

Prof. M. A. Poey, Ex-Director of the Observatory of Havana, and also a member of the French Scientific Expedition to Mexico, made remarks on the periodical occurrence of physical phenomena, as storms, seasons of cold and heat, etc., dwelling more at length on meteoric showers and solar spots. He also advanced the theory that all moral phenomena, as well as physical, can be traced to similar causes and relations, and that seasons of crime are as regular and independent of human control as the yearly changes.

The Castle Peaks.

Prof. Whitney stated that, within the past fortnight, the Geological Survey had ascended three of the mountains known as "Castle Peak." One of these, known also as Fremont's Peak, is in Nevada county, four miles north of Summit Station. It is the most elevated peak between the Pyramid Peak group and Lassen Peak. It is part of the broken rim of a volcano and from it, to the north, one can look down into the former crater, at a depth of 600 to 800 feet below. To avoid confusion, this will be designated by surveyors hereafter as Mount Stanford.

The second Castle Peak is in Mono county, 12 miles S 10° W. of Bridgeport. This is about 12,000 feet high, and is a very conspicuous object. The name is not particularly appropriate, as the peak is rounded in outline, consisting of metamorphic slate. Its present name is retained, however, as it has become so firmly fixed, although evidently given originally under a mistaken idea that it was the point so named by Mr. Goddard.

The mountain really so named by Mr. G. H. Goddard, in 1854, is about 10 miles west of the last, and in Tuolumne county, at the head of the West Walker. Until now it has never been ascended. It is about 11,000 feet high, and, with its granite pinnacles, presents a very fine appearance. It is to be known, hereafter, as Tower Peak. The exact altitudes of these points have not yet been calculated, as all the observations have not been received.

Geology of Northern China.

Prof. Whitney read extracts from letters written by Baron Richthofen on the Loess formation in Northern China. This is most extensive, spreading in an almost continuous sheet of great thickness over the whole surface of the country, rising on the high plateaus or over the entire area of the Northern Province of China, and probably extending far into Central Asia. It is very porous and frequently intersected by small ramified tubes, evidently the spaces formerly occupied by rootlets, their walls being usually coated with a thin calcareous deposit. The formation is nowhere stratified, is in some places 1,500 feet thick, and contains in all parts an abundance of perfectly preserved shells of the genus *Helix*, and in many places the bones of land animals. The origin of this remarkable deposit affords an exceedingly interesting study, but will require very careful and detailed observations before a satisfactory conclusion can be arrived at.

INYO COUNTY, ships monthly, according to the *Independent*, about 200 tons of hullion to San Francisco, and receives back about the same weight of merchandise, at an aggregate cost of \$36,000 per month. This is, of course, a tremendous tax on her resources, even taking no account of the loss sustained, by the capital invested, by the amount of time consumed in the transportation. Naturally the *Independent* calls loudly for roads and railways.

ANOTHER TOWN BURNT DOWN. Canon City, Green County, Oregon, has been wholly destroyed by fire, which, originating in a restaurant, spread through the town so thoroughly, that only three buildings, according to the accounts, were left standing, while some seventy-five were burnt down. Such conflagrations are getting unpleasantly frequent this year. Earthquakes are fading out in comparison.

The Coming Horticultural Exhibition.

Active preparations are being made for the opening of the Great Horticultural, Agricultural and Pomological Exhibition, which will take place at the Pavilion, in this city, on Monday next. This exhibition has been undertaken under the auspices of the Mechanics' Institute, and will continue for five days. Heretofore the Institute has confined its exhibitions to departments of trade and manufactures. The innovation now proposed will certainly be an agreeable, if not a profitable, change, and we have no doubt this exhibition will be as creditable to the productions of our soil and climate, as former ones have been to our progress in mechanics and manufactures.

Let each individual of our agriculturalists of every class, run their eyes over the large and liberal premium list presented, and seriously consider two important points: 1st, whether one or more of these prizes are not worth taking, and 2d, whether it is not within his power to carry one or more of them off. A prize thus awarded has a two-fold value—its intrinsic worth and its influence on the future. A Mechanics' Institute prize or diploma, fully deserved and properly managed may revolutionize a business—may be made an over-present, an ever-active influence in behalf of the owner.

Extensive preparations are being made at the Pavilion to render the exhibition interesting, attractive and instructive. The large hall is being elegantly and appropriately decorated and festooned with evergreens, flags, mottoes, etc. Seats will be provided for 5,000 persons, while broad avenues, winding alleys and cosy retreats will be arranged in keeping with the character of the Exhibition. The Pavilion will be brilliantly illuminated, and the visitors will be entertained and delighted with the choicest music, both vocal and instrumental. It is intended that the entertainment alone, which will be daily and nightly presented, will be well and more than worth the cost of admission—\$2.50 for a season ticket, admitting a gentleman and lady; or \$1.50 for single season tickets.

WHEAT.—The farmers are generally disappointed at the small advance in wheat produced by the European war. What little advance has occurred is mostly taken up by increased freight. The disposition at first evinced to hold on, has very properly given way, and wheat is now rapidly coming forward. Every means of transportation is taxed to its utmost to move it to shipping points. The reduction in cost of transportation and shipment by the opening up of Vallecjo and Oakland is helping the farmers much, who are directly connected with these points. It is of no consequence to the State at large where wheat is landed, provided it is done cheaply, and the saving in expense inures to the benefit of the farmers.

THE WHEAT CROP.—Contrary to general expectation, and to the oft refuted observations of interested parties, some of whom predicted a falling off of two million cents, the receipts from wheat crop of the present year will be fully equal to that of the last. The small advance in the price and the superior character of the grain will more than make amends for the very small, if any diminution in, quantity produced. The wheat generally has been freer from cheat, oats, etc., than during any previous season. More care has also been taken in cleaning the wheat for market.

RECEIVED.—A programme of the Sheffield Scientific School, and a pamphlet, by Prof. Dana, on the "the Academic College and the Scientific College," also the "Practical Millwright and Miller." These will be noticed next week.

A New Boiler.

The engravings illustrate the principle adopted in the construction of the Whittle boiler, and the mode of their action, Fig. 1 showing the circulation of the water in a Cornish boiler, and Figs. 2 and 3 showing it in cylindrical boilers. The object of the invention is the prevention of incrustation, and increased safety and economy. This is accomplished by means of a rapid and perfect circulation of the water over the heated parts of the boiler, as shown in the engravings. The action of the boiler is based on the natural law of circulation of a fluid when exposed to different degrees of temperature, the hotter particles ascending while the cooler descend. It is obvious that if the whole fluid be of a uniform temperature, there will be no tendency to circulate. Thus, in a boiler of the ordinary

in a full stream when the water lies in a Cornish boiler had sunk as low as the level of the fire bars, thus keeping the fire flues completely covered, and the boiler as safe as though the water had been at the proper height.

We are informed that the Whittle Boiler Co. have had the boilers in use night and day for about 12 months; and the plates have been kept free from incrustation, it is said, when the boilers have worked eight to ten weeks with bad water and without blowing off during the whole time, while an immense amount of mud and chips was found in the casing. At some experiments at the Stowbridge Water Works with a plain cylindrical boiler, 35x6½ feet, 1,000 pounds of coal evaporated 7,500 pounds of water without, and 9,000 pounds (or one-fifth more) with the Whittle lining.—*Colliery Guardian.*

FIG. 1.

FIG. 2.

WHITTLE'S NEW BOILER LINING.—FIG. 3.

construction, although there may be, and undoubtedly is, ebullition, there is not circulation in the full sense of the term—only a disturbance of the particles caused by the passage of the steam globules. A great impediment is offered to the free passage of the steam, especially when the water is thickened with mud; and this causes the globules of steam to linger about the surface of the hot plates, and prevents the heat from being taken up by the water from them as fast as if steam were set free with greater facility, as is accomplished in the Whittle boiler.

In this the great body of water is contained in the inner casing and kept from actual boiling by the interposition of this casing between it and the boiler sides; thus the whole of the water is made to circulate in a thin stream over the hot plates in rapid and constant succession. Thus the steam globules are carried off as soon as they are formed, together with the mud-particles set free in the water by evaporation, and delivered on the surface of the water in the inner casing, where they quickly subside, and are kept from future contact with the boiler plates. Thus the formation of hard, scaly incrustation is prevented, and the water, as well as the boiler, remains comparatively clean, enabling steam to generate much more quickly and effecting a considerable saving of fuel. The mud in the collector is not disturbed, as the great body of water does not boil unless the steam be of very high pressure, and then it only simmers.

An important advantage claimed for the Whittle patent is that however low the water may be in the body of a boiler, an artificial level is maintained as high as the top of the flues, as shown in the engravings, in which the lines showing the height of the proper water level and the low water mark, are taken from actual practice; and it has been proved that the water is made to pour over the upper edge of the casing

GOPHER TRAP.—Mr. D. N. Phelps, of San Leandro, has invented a gopher trap, which is exceedingly simple, and, at the same time, efficient. The wily gopher passing unsuspectingly over a simple piece of wire is nipped and brought to an untimely end. The trap is ingeniously and cheaply constructed. Its trial has been very successful. A sample can be seen at this office.

On the 11th of this month, a party of eight or ten men were to commence the ascent of Long's Peak, Col., under the guidance of Mr. G. J. Evans, who acted as reporter for the *Boulder County News*. A copy of that paper and one of the *Scientific Press* were sent to be deposited in a tower, which was to be erected on the summit. The *Press* is always glad to take a trip in such good company.

We have received a copy of Heath's Infallible Counterfeit Detector at Sight, published by Laban Heath, Boston, Mass. With such testimonials as accompany it, we need say nothing further, except to advise those liable to have counterfeit bills passed on them, to provide themselves with the book.

Hax is selling in Nevada at \$20 per ton, cheaper than ever sold before in that market. Barley also is being sold in Nevada for \$1.60 per cental—the lowest it has ever been in that market.

A pane of glass seventeen feet high and ten feet wide, just set up in New York, is considered the largest in the country.

Patents and Inventions.

A Full List of Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS TO DEWEY & CO., U. S. AND FOREIGN PATENT AGENTS, AND PUBLISHERS OF THE SCIENTIFIC PRESS.]

FOR THE WEEK ENDING AUGUST 14th.

BEVERAGE OR "CHAMPAONE MEAD."—Asher S. Taylor, San Francisco, Cal.

DESIGN PATENT.—HAND-STAMP.—Jules F. Pagcs, San Francisco, Cal.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO., in the shortest time possible (by telegraph or otherwise), at the lowest rates. All patent business for Pacific coast inventors transacted with greater security and in much less time than by any other agency.

The New Patent Act.

AN ACT TO REVISE, CONSOLIDATE AND AMEND THE STATUTES RELATING TO PATENTS AND COPYRIGHTS.

APPROVED, JULY 8, 1870.

[CONTINUED FROM PAGE 129.]

SEC. 35. And be it further enacted, That any person who has an interest in an invention or discovery, whether as inventor, discoverer, or assigner, for which a patent was ordered to issue upon the payment of the final fee, but who has failed to make payment thereof within six months from the time at which it was passed and allowed, and notice thereof was sent to the applicant or his agent, shall have a right to make an application for a patent for such invention or discovery the same as in the case of an original application: Provided, That the second application be made within two years after the allowance of the original application. But no person shall be held responsible in damages for the manufacture or use of any article or thing for which a patent, as aforesaid, was ordered to issue, prior to the issue thereof: Provided, That when an application for a patent has been rejected or withdrawn, prior to the passage of this act, the applicant shall have six months from the date of such passage to renew his application, or to file a new one; and if he omits to do either, his application shall be held to have been abandoned; upon the hearing of such applications abandonment shall be considered as a question of fact.

SEC. 36. And be it further enacted, That every patent or any interest therein shall be assignable in law, by an instrument in writing; and the patentee or assignee or legal representative may in like manner, grant and convey an exclusive right under his patent to the whole or any specified part of the United States; and said assignment, grant, or conveyance shall be void as against any subsequent purchaser or mortgagee for a valuable consideration, without notice, unless it is recorded in the Patent Office within three months from the date thereof.

SEC. 37. And be it further enacted, That every person who may have purchased of the inventor, or with his knowledge and consent may have constructed, any newly invented or discovered machine, or other patentable article, prior to the application by the inventor or discoverer for a patent, or sold, or used one so constructed, shall have the right to use, and vend to others to be used, the specific thing so made or purchased, without liability therefor.

SEC. 38. And be it further enacted, That it shall be the duty of all patentees, and their assigns and legal representatives, and of all persons making or vending any patented article for or under them, to give sufficient notice to the public that the same is patented, either by fixing thereon the word "patented," together with the day and year the patent was granted; or when, from the character of the article, this cannot be done, by fixing to it or to the package wherein one or more of them is inclosed, a label containing the like notice; and in any suit for infringement, by the party falling so to mark, no damage shall be recovered by the plaintiff, except on proof that the defendant was duly notified of the infringement, and continued after such notice, to make, use, or vend the article so patented.

SEC. 39. And be it further enacted, That if any person shall, in any manner, mark upon any thing made, used, or sold by him for which he has not obtained a patent, the name or any imitation of the name of any person who has obtained a patent therefor, without the consent of such patentee or his assigns or legal representatives; or shall in any manner, mark upon or affix to any such patented article the word "patent" or "patented," or the words "letters-patent," or any word of like import, with intent to imitate or counterfeit the mark or device of the patentee, without having the license or consent of such patentee or his assigns or legal representatives; or shall, in any manner, mark upon or affix to any unpatented article the word "patent," or any word importing that the same is patented, for the purpose of deceiving the public, he shall be liable for every such offence to a penalty of not less than one hundred dollars, with costs; one moiety of said penalty to the person who shall sue for the same, and the other to the use of the United States; to be recovered by suit in any district court of the United States within whose jurisdiction such offence may have been committed.

SEC. 40. And be it further enacted, That any citizen of the United States, who shall have made any new invention or discovery, and shall desire further time to mature the same may, on payment of the duty required by law file in the Patent Office a caveat setting forth the design thereof and its distinguishing characteristics, and praying protection of his right until he shall have matured his invention; and such caveat shall be filed in the confidential archives of the office and preserved in secrecy, and shall be operative for the term of one year from the filing thereof and if application shall be made within the year by any other person for a patent with which such caveat would in any manner interfere, the Commissioner shall deposit the description, specification, drawings, and model of such application in like manner in the confidential archives of the office, and give notice thereof, by mail, to the person filing the caveat, who, if he would avail himself of his caveat, shall file his description, specification, drawings, and model within three months from the time of placing said notice in the post office in Washington, with the usual time required for transmitting it to the caveator added thereto, which time shall be indorsed on the notice. And an alien shall have the privilege herein granted, if he shall have resided in the United States one year next preceeding the filing of his caveat, and made oath of his intention to become a citizen.

johns, Carboys, Soda, Wine and Brandy Bottles, etc.,
etc., will receive prompt attention. Private Moulds
made to order from \$10 to \$30. 2v21-4t

VARNEY'S
PATENT AMALGAMATOR
These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they
have no equal. No effort has been, or will be, spared to
have them constructed in the most perfect manner, and of
the great number now in operation, not one has over-
required repairs. The constant and increasing demand for
them is sufficient evidence of their merits.
They are constructed so as to apply steam directly into
the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:
The pan being filled, the motion of the muller forces the
ulp to the center, where it is drawn down through the ap-
erture and between the grinding surfaces. Thence it is
thrown to the periphery into the quicksilver. The curved
plates again draw it to the center, where it passes down,
and to the circumference as before. Thus it is constantly
passing in a regular flow between the grinding surfaces and
into the quicksilver, until the ore is reduced to an impalp-
able powder, and the metal amalgamated.
Settlers made on the same principle excel all others.—
They bring the pulp so constantly and perfectly in contact
with quicksilver, that the particles are rapidly and com-
pletely absorbed.
Mill men are invited to examine these pans and settlers for
themselves, at the office, 220 Fremont street,
1v1 SAN FRANCISCO.

AN OVER-DOCTORED WORLD.—All great physicians ad-
mit that the world is over-doctored with violent drugs.
In cases of indigestion, biliousness, constipation, wind,
colic, diarrhoea, and other casual or even chronic af-
fections of the stomach, liver, and bowels, all that is need-
ed to restore the regular action of the disordered organs,
is a dose or two of TARRANT'S EFFERVESCENT SELTZER
WATER, the most delicious and harmless febrifuge,
laxative and alterative, in the whole range of medicinal
remedies. It is sufficient for the strongest, cannot harm
the weakest, and immediately relieves the nausea which
ordinary cathartics aggravate.

A NEW REMEDY.

As this Preparation of these plants, lately made public (Patented June 23, 1870), but long proven in Siskiyou county, Cal., owes its efficiency entirely to its remarkable power of INCREASING THE INSENSIBLE PERSPIRATION, or, in other words, the VAPORY EXHALATIONS from the millions of minute pores of the EXTENSIVE SKIN, from the crown of the head to the sole of the foot, it is all important that the direction to pass a sponge, or towel, dampened with salicatus water, under the clothing, twice a week, or oftener, be attended to.

Also, that when taken by LADIES, for IMPROVING THE COMPLEXION, for which it is very successful, that it should be in half doses, often repeated; and that one of the Pills of Citrate of Iron and Gum Myrrh, which are beneath the bottom label of each bottle, be taken at night, much aiding in restoring Color in the Cheeks and Lips. To CHILDREN also, give it "a little and often." It is agreeable to them any way, but especially if sweetened a bit; and it is admirably suited to their Diseases, which generally are those of the MUCOUS MEMBRANES.

FOR the irritated throats of PUBLIC SPEAKERS, Lawyers, Ministers, Teachers, and

FOR driving off threatened CONSUMPTION and Asthma, all Colds and Coughs;

FOR irritated Stomachs, from Bad Liquor, Alkali Water, Strong Coffee, Salicatus Bread;

FOR humors on the Skin, or MUDDY COMPLEXIONS, or, in a single sentence,

FOR all Diseases of the MUCOUS MEMBRANES, the Surest, and by far the MOST PLEASANT MEDICINE yet found, in its TASTE and EFFECT, is

DR. FURBER'S CORDIAL OF MOUNTAIN BALM

—AND—

OREGON GRAPE,

Two Plants, abounding on the base of, and on the Mountains surrounding

MOUNT SHASTA, CALIFORNIA,

For all the purposes of the various PREPARATIONS OF SALICATILLA, richer in quality and more efficient as a RESTORER OF GOOD BLOOD, and acting equally as surely,

ECCLESIASTICUS. XXXVIII.

—Verse. Fourth—

The Lord hath created medicines out of the Earth. And he that is wise, will not abhor them.

TRADE MARK.

and as well on the LUNGS as on the STOMACH, is superior to other COUGH MEDICINES, by bringing BOTH to bear with the stimulated action of the WHOLE SKIN in throwing off Disease of either.

FOR SALE AT SAN FRANCISCO BY

R. H. McDONALD & CO., Druggists.

INVALIDS of any of the classes named above will find this worthy of TRIAL. Its virtues, as above asserted, not being visionary, but improved from the SHASTA INDIANS' knowledge and use of these PLANTS for centuries back, made known by them to us.

Such an Invalid, residing at a distance, wishing to try it, had better procure a package of one-fourth of a dozen, which can be done by sending in letter to the above a \$5 greenback, and directing that the package should be sent by WELLS, FARGO & Co's Express to that office which is nearest to the invalid's residence, and that person will be sure to get it. 3v21-12tw

DESIGNS AND PLANS

—FOR THE—

NEW CITY HALL

—OF—

SAN FRANCISCO.

Office Board of City Hall Commissioners, southeast corner of Sacramento and Montgomery streets, San Francisco, June 22, 1870.

The Board of City Hall Commissioners hereby give notice that they will be prepared to receive at their office, on or before the FIRST DAY OF NOVEMBER NEXT, designs and plans for the new City Hall of San Francisco.

The Commissioners, in order to obtain the very best design and plan, invite the fullest competition among architects, and to this end have resolved to offer the following premiums:

First—For the design and plan selected and adopted.....\$2,500
Second—For the second best design and plan..... 2,000
Third—For the third best design and plan..... 1,500
Fourth—For the fourth best design and plan..... 1,000
Fifth—For the fifth best design and plan..... 500

The premiums payable in City Hall warrants.

As a guide to architects in the preparation of the designs and plans, the Commissioners have prepared a pamphlet containing full instructions and suggestions, as well as the terms and conditions upon which the premiums will be awarded.

Pamphlets can be had on application at the office of the Commissioners.

Any design or plan in which the requirements of the Board, as set forth in the printed instructions, have not been reasonably complied with, will be rejected from the competition.

P. H. CANAVAN, Chairman,
JOS. G. EASTLAND,
CHAS. E. McLANE,
City Hall Commissioners.

Reading for the Hour.

A Needle-Cannon.

The *Abend Post* of the 13th has the following from a correspondent:

The latest improvement in artillery is Von Dreyse's *Double Needle Cannon*. It is composed of two barrels, fixed parallel to each other on the gun carriage, which, in the middle, between them, holds an ammunition box. But one gunner is seated behind each of the cannons; a grasp and a jerk opens the hind part or breech; the gunners seize alternately, the one on the left with his left, and the one on the right with his right hand, the *cartouch* which lies ready between them and which is instantly replaced by another rolling up along the gun carriage from the ammunition box; they open the cannon, which admits of a circular motion upwards or downwards, to the right or the left; the gunner presses with his chest firmly forward in a fork attached to the breech, which, as well as the seat, is covered with leather. The cannon becomes fixed—a jerk—and the shot rolls forth without causing hardly any recoil; the gunner remains in his seat; immediately after, the thunder of the second cannon is heard, and then commences a perfect cannonade, the shot flying at the rate of 30 in a minute.

The cannons have a 3-pound or 6-pound bore, and are of truly gigantic power; a projectile thrown from a 6-pound rifled piece, at a trial of shooting superintended by Dreyse himself, traversed, at a distance of 3,000 paces, a forged plate of 3 inches in thickness and set fire to some woodwork behind.

The new invention is but known as yet to few, it having been kept secret. During the war of 1866, it was not sufficiently advanced to warrant its use. Since last year it has been ready for the destruction of an enemy—the French have been made acquainted with it.

SPARKS FROM A SEAR.—Mr. Joseph Segar, of Washington, a gentleman (?) who appears to have attempted to cowhide somebody and to have failed therein, has been puffing away in the *Star*. After blowing a very airy cloud of smoke, he remarks, "I trust I may be allowed to embrace this occasion to protest against the press in caricaturing, by ridiculous and sensational articles, honorable gentlemen who may find it indispensable to be involved in personal broils. It is unworthy of a decent press or of honorable gentlemen. If there shall be no reform in this matter, gentlemen of pride and honor will be compelled to apply the cowhide and the bludgeon to men of the press, as well as to other offenders." This pretentious cabbage-leaf segar hath an unpleasant odor.

THE LAVAS OF VESUVIUS are said to contain a greater variety of minerals than any others in the world as far as is known. Haüy mentions that, out of 380 simple minerals known to him, no less than 82 have been found on Vesuvius. Lyell thinks that these have not been thrown up in fragments from some older formation, through which the gaseous explosions have burst, but have been sublimed in the crevices of lava.

BELLS.—The largest bell in the world is in Moscow. It was cast in 1653, is 21 feet 4½ inches high, 22 feet 5½ inches in diameter where the clapper strikes, and is believed to weigh from 360,000 to 440,000 lbs. There is some considerable doubt as to whether it was ever rung. It was consecrated as a chapel in 1837, the entrance to the interior being through a large fracture near the mouth, the cause of which is disputed. The largest bell in America is that of Notre Dame Cathedral at Montreal, which weighs 29,000 lbs. The bell of Notre Dame Cathedral at Paris, cast in 1680, and that of the Parliament House in London, weigh each 30,000 lbs.

BLOSSOM ROCK.—Last Saturday an examination of Blossom Rock showed that the water was at least 24 feet deep at all points, so that Col. Von Schmidt has fulfilled his part of the contract.

An Iron Mattress.

Most likely all of our readers have heard of the man who lived somewhere and was condemned to sleep for years on a bed of projecting points of iron. And very likely our readers will think of this very man, when they see the heading of this article. Whether or no the inventor of the mattress here illustrated, had his soul stirred within him by the tale alluded to, and desired to patent an iron bed, which might put to shame the inventor of the story, we are uninformed, but we do know that his patent is quite as interesting as is the little history which has become so famous.

The iron mattress of to-day is a strong fabric of fine wire springs, so coiled and interwoven, by a curious process of double weaving, that, when stitched on a proper frame, it forms a comfortable, electric sleeping arrangement. The wire is tinned, to avoid rust and for the sake of a better appearance. It is clean, noiseless, durable and very elastic. It saves one mattress. On it can be placed a thick mattress for cold weather, or a thin covering for the warm season, or any article of the kind which the sleeper may desire.

The durability of the bed is stated to be very great and the fabric is guaranteed to be "nearly indestructible." It has a flexibility as of rubber cloth, and adapts itself to the form of the body to a marked degree. It is in use in many hospitals and other public institutions, where its cleanliness especially recommends it, and where its economy is also a very considerable point, while it is said to be equally or

WOVEN WIRE MATTRESS.

more comfortable for the patients than the common forms. For a hot climate, it would seem to be especially good.

There are several kinds and sizes made, for cribs, for hospital and private use, for the berths of steamers and of sleeping cars, (where we hope they may be extensively introduced) and for other purposes. We have not tried the mattress ourselves, but there are a number of persons who have and who pronounce it good. If our readers desire to hear more about it, they can do so by applying to George C. Perkins, Secretary Woven Wire Mattress Co., 59 Pearl street, Hartford, Conn.

IN MONTANA.—W. H. Murray, our agent is now in Montana, offering people there an excellent opportunity to subscribe for the *Press*.

SILK PREMIUM.—The Contra Costa Agricultural Society recognizes the importance of silk culture, by offering a special premium for the best domestic exhibit.

TELEGRAPHIC. The San Diego *Union* of the 18th says: The extension of the lines of the Western Union Telegraph Company was completed on Monday evening last, but the wires have not as yet been in working order. The operators are now on the line, to rectify the causes of delay, and it is believed that communication will be open in a few days. [The line is now being worked.—Ed.]

To Eastern Readers.

We fully believe that all the leading and intelligent seeking Mechanics, Manufacturers, Farmers and Miners in the Atlantic States, who venture to subscribe for the *SCIENTIFIC PRESS* in its present improved standard, will feel more than paid for their \$4 investment. We are adding new names for every issue from various parts of the Union.

Pushing Forward.

It is hardly necessary in commencing a new volume, as we do to-day, to remind our readers that we are constantly *pushing forward* in our efforts to improve the *SCIENTIFIC PRESS*. We have never relied upon promises of what we propose to do; but have always been able to point to what we have done in the past, as the best assurance of what is in store for the future.

At the opening of the present year we reduced the price of the paper from \$5 to \$4 per annum, believing that the modified condition of affairs on the Pacific slope, growing out of the opening of the Overland Railroad, and other facilities for more frequent intercourse with other portion of the world, fully warranted such a step. Our anticipations have been more than realized in the increase of subscriptions, so much so as to enable us to give an additional amount of reading matter by the presentation to our readers of a double-sheet the first issue of every month.

Illustrations.

We have also made such arrangements as are now enabling us to greatly increase the number, interest and variety of our illustrations. While this improved feature adds largely to the cost of publication, we feel confident the additional interest and value thereby given to our columns, will be duly appreciated by a discerning public.

The Miner, the Mechanic, the Inventor, the Farmer and the Naturalist, will all find something of constant and practical interest in this direction.

The Miner will always be presented with everything new in the way of reducing ores, whether by

mill process or by smelting.

All important improvements in Machinery will be promptly presented to the Mechanic, while the Inventor will be as regularly furnished with hints and stepping stones upon which others have mounted, and from which he in turn will be able to see still further and more clearly into the undiscovered future.

The ideas and instructions that we are here constantly placing before the Farmer will speak for themselves. If the reader will pardon us for a mere hint at the future, we venture the promise that no one thing that is new and of any real practical importance in the mechanics of Agriculture shall be omitted in that portion of our illustrative department.

The Naturalist too will now and then find something to interest and instruct; while the general reader is never forgotten.

How far we have succeeded in making the *SCIENTIFIC PRESS* acceptable to the public, we can only judge by the words of hearty commendation which we are constantly receiving, not only from our brethren of the press, but from numerous private letters, from the readiness with which our patrons pay up their annual subscription and from the rapid increase in the list of subscribers.

A reference to the index published in our last issue affords the best evidence of the wide field of research and instruction in which we are engaged. The present number affords ample evidence of the truth of what we have written, and to strangers our subscribers can fully attest that the present is but an average of our issues on the first of each month.

The carefully digested mining summary which we give each week; the chronicles of scientific and mechanical progress; the large and varied information on agricultural matters, and the many matters of general and special interest, together with

the numerous illustrations, in all the various departments, combines an amount of information which for value, interest and variety, will not suffer in comparison with any periodical of the day.

We trust that those for whom the *Press* is published will exert themselves to enlarge its sphere of usefulness by extending its circulation, and thus strengthening the hands of the publishers for still greater efforts, feeling satisfied that the benefit will be mutual. July 2d, 1870.

TO MINERS, MILLMEN AND METALLURGISTS. Kistler's new work on the Concentration of all kinds of Ores, and the Chlorination Process, for Gold-bearing Sulphurets, Arseniurets, and Gold and Silver Ores generally, is the best and most complete work issued. It contains 120 diagrams, illustrating machinery, etc., which alone are of the greatest value. Price, \$7.50, postage paid. Published by Dewey & Co., publishers of the *Scientific Press*, San Francisco.

OF COURSE.—San Francisco people have come to believe that there is only one place to get spectacles.—C. M. LEE'S.

DR. HARTMANN, Physician, Oculist and Medical Electrician, cures all diseases of the eye, such as Granulated Eye Lids, Inflammation of the Eye, Opacities of the cornea cured permanently. Also, Paralysis, Rheumatism and all Nervous and Chronic Diseases, and all Female Complaints. 128 Kearny street. 25-620.

A NEW ADVERTISING DONOR.—Everytime a lady who uses fragrant Sogoront opens her mouth, she advertizes the article. The state of her teeth is a certificate of its excellence. No spot darkens their surface, no impurity clings to them, the cushions in which they are set are rosy, and the breath that swells through them is sweet as the breeze of June.

"SPALDING'S GLUE" useful in every house.

HAVING had numerous applications to purchase the right to manufacture CHAMPAGNE MEAD (the great temperance drink), we will state that we are now prepared to sell State and County Rights on reasonable terms. KENYON, GASS & CO. 2421-3m

San Francisco, July 10, 1870

CO-OPERATIVE UNION STORE.—This is becoming one of the most useful institutions in the city, and the Mechanic and Laboring Man fully appreciate it. They are now enabled to buy their Groceries at 20 per cent. cheaper than ever before, and the very best articles in the market. The store is located at 115 Sutter street, Lick House Block.

PHOTOGRAPHY.—For Cabinet Photographs, or Enamelled Cards, of the very best quality, you must go to the NEW YORK GALLERY, Nos. 23 and 27 Third street, San Francisco. Every picture warranted to give satisfaction. 10v18 6m B. F. HOWLAND.

BOILER FELTING saves twenty-five per cent. of fuel, BERRY & PLACE'S MACHINERY DEPOT, No. 114 California street. 1v21-3m

BLOTTING TIN AND SOLDER WIRE, broom wire, piano covering wire, etc., manufactured by Joshua Gray, 437 Brannan street. 4v19-3m

THOMAS O'NEIL Ornamental Glass Cutter, No. 10 Stevenson street, up stairs. Stained, Ground and Ornamental Cut Glass to order on reasonable terms. 1v420

MARAVILLA COCOA. For Breakfast.—The *Globe* says: "Various importers and manufacturers have attempted to attain a reputation for their prepared Cocoas, but we doubt whether any thorough success has been achieved until Messrs. Taylor Brothers discovered the extraordinary qualities of 'Maravilla' Cocoa. Adapting their perfect system of preparation to this finest of all species of the Theobroma they have produced an article which supercedes every other Cocoa in the market. Entire solubility, a delicate aroma, and a rare concentration of the purest elements of nutrition, distinguish this Maravilla Cocoa above all others. For invalids and invalids we could not recommend a more agreeable or valuable beverage." Sold in packets only by all Grocers, of whom also may be had Taylor Brothers Original Homoeopathic Cocoa and Soluble Chocolate. Steam Mills—Brick Lane, London. 5v20-1y

A VALUABLE BOOK FOR INVENTORS AND ARTISANS.—Dewey & Co., publishers of the *SCIENTIFIC PRESS* and Patent Agents, have just issued a neat little volume of over five hundred well executed cuts of the principal mechanical movements known. These useful representations of the various appliances of power are related side by side with explanatory notes, which makes the subject clear to every reader. Such a book should be in the hands of every mechanic, and form part of every public school library. It is a handy book, and cheap enough for every farm, shop and factory. Sent to any address from the *SCIENTIFIC PRESS* office, postpaid, for \$1.—New Age.

Card

From the National (Elgin) Watch Co. The attention of Watch-buyers is called to the improved American Watches, manufactured by the National (Elgin) Watch Company of Elgin, Ill.

Ladies desirous of purchasing a handsome, strong and correct time piece will find the elegant Watch bearing the trade mark of "LADY ELGIN" to be all that they desire. Inquire of your jeweler for the LADY ELGIN.

Send for Agents' Circulars and Price List to Giant Cement Manufacturing Co., 419 Washington street, San Francisco.

MINERS' RUBBER CEMENT.
MINERS' RUBBER CEMENT.

This Valuable Family Medicine has been widely and favorably known in our own and foreign countries upwards of THIRTY YEARS!

It has lost none of its good name by repeated trials, but continues to occupy a prominent position in every family medicine chest.

It is an External and Internal Remedy. For Summer Complaint, or any other form of bowel disease in children or adults, it is an almost certain cure, and has without doubt, been more successful in curing the various kinds of CHOLERA than any other remedy, or the most skillful physician. In India, Africa and China, where this dreadful disease is more or less prevalent, the Pain Killer is considered by the natives, as well as European residents in those climates, a sure remedy; and while it is a most efficient remedy for pain, it is a perfectly safe medicine, even in unskillful hands. Sold by all Druggists. Price 25 cents, 50 cents, and \$1 per bottle.

Directions accompany each bottle. 9v21-2t

WANTED.

THE ADDRESS of parties making FANCY ARTICLES in sheet or white metal. J. W. DURHAM,
8v21-1t RIMLEY, TENN.

The large majority of United States and Foreign Patents granted to inventors on the Pacific coast during the past few years, have been obtained through the agency of DEWEY & Co., publishers of the SCIENTIFIC PRESS. Established in the year 1860, we have an extensive patent library, with full record of cases on this coast, and can give the best and most reliable advice as to the patentability of new inventions.

THE GRAND
Horticultural, Agricultural and
Pomological
EXHIBITION
OF THE

MECHANICS' INSTITUTE,
Will open on MONDAY, AUGUST 29, 1870, and continue
for FIVE DAYS, at the

Pavilion Building,
On Union Square, San Francisco.

The Exhibition will be of
FRUITS, WINES, FLOWERS, FERNS, PLANTS, SHRUBS, CEREALS, and all that relates to the
VEGETABLES,
Flora of California.

Every facility will be extended to Exhibitors, and

CASH PREMIUMS

To the amount of Two Thousand Dollars

Will be awarded to Competitors in the Products of the Soil.

THE SOCIETY'S Gold Medal will be awarded for CALIFORNIA WINES.

THE PAVILION will be appropriately decorated, and in the evening, in addition to the Floral and Pomological display, there will be Music by the best attainable FULL BAND, and Instrumental Solos.

The Exhibition will be visited by many of the representatives of the leading Horticultural and Agricultural journals of the Eastern States, now on a visit to California to inspect its Fruits, Flowers and Agricultural resources.

ADVISORY COMMITTEE:

DR. EZRA CARR, Professor of Agriculture and Horticulture, State University.

S. W. SHAW, President Fruit Growers' Association.

J. S. HITTLE, Author Resources of California.

E. J. WEEKS, President Bay Dist. Ag. Society.

J. L. SANFORD, Napa.

Mr. HASKELL, Marysville.

A. J. MOULDER, Sec'y Board of Regents.

It is intended that this Exhibition shall be THE feature of the season, and everything will be done to make it an agreeable and attractive entertainment to the visitor.

ADMISSION:

Double Season Tickets, (Gentleman and Lady) \$2 50

THE WILSON

Patent Steam Stamp Mill.

This extraordinary Mill, now so justly popular in the East, is now offered to the miners of the Pacific Coast. Having been in operation now for about two and a half years, the Company feel confident that the

WILSON STEAM STAMP MILL,

For Durability, Efficiency,

AND ECONOMY OF WORKING,

HAS NO EQUAL.

The Wilson Steam Stamp Mill is the only Steam Mill that has had the severe ordeal of practical working, and proved itself eminently successful. It is now in operation in several of the Eastern States and Territories, and gaining an enviable popularity. The whole machine is so simple as to be readily understood by the most ordinary minds. In fact, its simplicity is its durability. The expense of crushing rock or cement with this Mill is less than one-half the expense of any other Stamp Mill, and less than one-half the cost. For further particulars inquire of

FURMAN R. WILSON,

San Francisco.

Or of THE WILSON STEAM STAMP MILL CO., 326

Walnut street, Philadelphia, Pa.

NORFOLK.—All persons are hereby warned not to manufacture or use any Steam Stamp Mills that are an infringement on the Wilson Patents, as they will be prosecuted to the utmost rigor of the law.

F. R. WILSON,

20v19-1f Supt. W. P. S. S. M. Co., Philadelphia.

Thursday Evening.

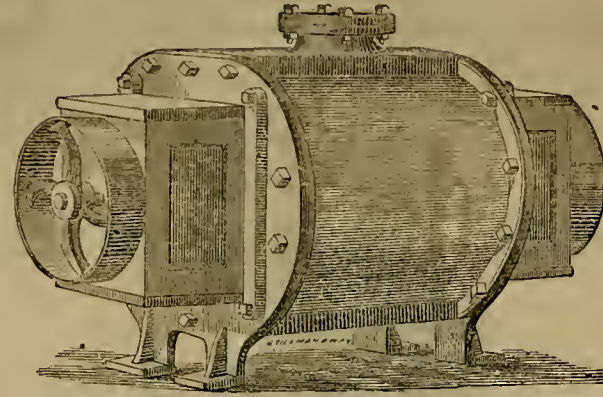

Owing to the time necessary to mail the present large edition of the SCIENTIFIC PRESS, we are obliged to go to press on Thursday evening—which is the very latest hour we can receive advertisements.

ROOT'S PATENT FORCE BLAST ROTARY BLOWER.

MANUFACTURED BY KEEP & BARGION,

At the Globe Iron Works, Stockton, California.

Patented Nov. 1st, 1861; July 21 1866; and Oct. 9, 1866.

Awarded the First Premium at the Paris Exposition.

ADAPTED FOR

Smelting,

Foundry,

Mining

and

Steamships.

REQUIRES

Fifty Per Cent.

LESS POWER

Than any Blower

Now in use.

One of these Blowers may be seen on exhibition at W. T. Garratt's Brass Foundry, corner of Mission and Fremont streets. They are also in use at the Almaden Quicksilver Mine; Gridley's Foundry, Gold Hill, Nevada; Etna Iron Works, San Francisco, and many other places.

CAUTION.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirements of the genuine article.

Quartz, Saw and Grist Mill Irons, Steam Engines, Horse Powers, High and Low Pressure Steam Engines, Steamboats and Propellers, made at short notice.

For circulars and further information, address

PATENT GARDEN SPRINKLER

AND PORTABLE FOUNT.

This is the best Garden Sprinkler in use for large plats. It spreads over a large space evenly and falls upon the ground like rain, and will not hurt the most delicate plant or flower. It is portable and easily moved from place to place, thereby making them a luxurious treat in a warm climate, by setting one down on the windward side of you at your repast and rest. Every Farmer in this warm climate should have one, that has pressure of water from tanks or otherwise. They are substantially made and not liable to get out of order, and cheap—the price being five dollars each. The above cut will convey the idea at once of their superstructure. Their weight being about five pounds, they can be used like a hose-pipe, in hand when wanted.

I also have Cast Iron Stocks, or Hydrants; price, \$3 50 each. PUMPS, assorted kinds, and

MANUFACTURER OF

Well Piping, Tin Roofing, Guttering Laying Water Pipe, Plumbing, Gas Fitting and General Jobbing.

LEA & PERRINS'

CELEBRATED

Worcestershire Sauce.

Declared by Connois-
seurs to be the only good
SAUCE. The success of
this most delicious and
unrivalled Condiment
having caused certain
dealers to apply the
name "Worcestershire Sauce" to their
own inferior compounds, the public is
hereby informed that the only way to
secure the genuine is to ask for LEA &
PERRINS' SAUCE, and see that their names
are upon the wrapper, labels, stopper and
bottle.

Some of the foreign markets having
been supplied with a spurious Worcester-
shire Sauce, upon the wrapper and labels
of which the names of Lea and Perrins have been
forged, L. and P. give notice that they have furnished
their correspondents with power of attorney to take in-
stant proceedings against manufacturers and vendors of
such, or any other imitations by which their right may
be infringed.

Ask for LEA & PERRINS' Sauce and see name on
wrapper, label, bottle and stopper.

Wholesale and for export by the Proprietors, Worces-
ter; Crosbie and Blackwell, London, &c., &c., and by
Grocers and Oilmen universally. Agents, CROSS &
CO., San Francisco. 1v20-1yeow

ENCOURAGING REMARKS.—One of our readers writes:
"Incorporating an agricultural department into your
paper has made it acceptable and really useful all over
the country west of the Rocky Mountains, and proba-
bly further; and for my part I do not see how an intelli-
gent farmer, miner or mechanic can do without it."

PACIFIC COAST READERS.

The Scientific Press,

[ESTABLISHED 1860.]

A large Illustrated, Practical Scientific Home Journal, devoted to

Mining, Farming, Mechanic Arts, AND INDUSTRIAL PROGRESS.

Each weekly issue contains 16 psges (size of Harper's Weekly), except our double sheet, published on the first week of each month, which comprises 24 pages. It is ably edited, and contains, in concise and desirable form, all the most important discoveries, inventions, improvements and developments in the various branches of Science, Mechanic Arts and Industrial Pursuits, interesting to all intelligent readers on this coast. We make a live paper for the times, using plain, comprehensive language, giving information which cannot be had from books, or so readily and cheaply obtained from any other source. Each number often furnishes profitable hints to the reader worth many times its annual subscription price. Please examine sample copies and subscribe at once, and you will not regret it.

Terms, for six months, \$2.50; one year, \$4—payable in advance. Sample copies of the PRESS and illustrated Patent circulars sent free on receipt of postage stamp.

PATENTS BOUGHT AND SOLD ON COMMISSION.

CLAY'S STEAM COOKER.

(PATENTED NOV. 23, 1869.)

A cheap, simple and practical invention that can be used with any Cooking Stove and the following advantages gained:

1st. It saves twenty five per cent in time and fuel over the ordinary method of cooking. 2d. It prevents the possibility of scorching, or burning food, while it is being cooked. 3d. No heavy, smutty, greasy pots and kettles are to be handled and cleaned; but light tin dishes come out of the Cooker, with nothing but drops of clean water on them. 4th. No odors can escape to fill the house, and attract the flies, and the flavor and nutriment are perfectly retained, rendering the viands more palatable and healthy than when prepared in the ordinary way. 5th. It can be used alone over a gas burner, or camp fire, and the food when cooked, keeps warm almost indefinitely. Mr. H. L. Southworth, Proprietor of the National Hotel at Salt Lake City, who has been using one for some time says: "I predict for it an entrance into the palace of the wealthy, the cottage of the peasant, the camp of the miner and the tent of the soldier, or wherever intelligence shall seek to take advantage of the improvements of the age." A complete working model can be seen at our office, and any person wishing to buy a County or State Right, can have the satisfaction of thoroughly testing its merits before investing his money.

The best HAY PRESS on the Pacific Coast. County Rights, State Rights and Presses for sale.

NEW GAS LIGHT for City and Country. BEAUTY, SAFETY and ECONOMY combined. You can buy a County Right for a few dollars and get the Lamp at cost prices. A full description furnished on application.

The only complete MUSIC FOLIO and PAPER FILE HOLDER yet invented. Samples of either furnished on application. The entire Patent or State Rights for sale cheap.

RIDER'S GOVERNOR CUT-OFF ENGINE,

Manufactured by the DELAMATER IRON WORKS,
WEST THIRTIETH ST., NEW YORK. The prominent features of this engine are: Economy equal to any; perfect regulation of speed by cut-off; entire absence of delicate or complicated mechanism; simplicity of design and non-liability of derangement; requiring no more care than common engines. NOTE.—This improvement can be applied in many cases to existing engines. Pamphlets sent on application 26v20-3m16p

NEW VOLUME.—The San Francisco SCIENTIFIC PRESS has entered its 21st volume, and is one of the most valuable journals published. Continuing, as it does, articles on every branch of home industry, the sciences, etc., the Press should find its way into every household in the land. The four dollars expended for a year's subscription to this journal may be repaid by the information gained by the perusal of only one number.—Alpine Chronicle.

A New Roasting Furnace.

From Colorado there comes to us a new furnace for oxidizing and chloridizing ores. This is the invention of Mr. John P. Arey, of Georgetown, from whose patent, dated May 17, 1870, we get the following description. We are also happy to be able to present our readers with an illustration of the device, the first which has yet been given of this furnace.

A represents the shaft of the furnace, which is formed within the walls, F, rising in a zigzag manner from the chamber, D, for collecting the roasted ore, and terminating at the summit of the furnace, at which point the ore is fed into the shaft. The prominent angles, *i*, of the opposite sides of this shaft, from bottom to top thereof, are in (or nearly in) the same vertical plane, which is indicated by the dotted line in the drawing. Hence the ore, while falling in streams through the shaft, will be crossed and recrossed by the heated currents rising from the fire-place, C C; hence also these currents will circulate freely through the spaces on opposite sides of the descending streams of ore and uniformly heat the shaft throughout its length.

Leading out of the shaft, A, near its upper end, is an escape-flue, B, which may be of the serpentine form shown, or may be straight. This terminates in a dust chamber, E, at the base of the furnace, and communicates with the shaft, A, by the transverse passage, *a*.

Near the upper end of the shaft, A, and on one side, is a fire-chamber, G, the products of combustion from which pass into the shaft and thence through *a* into B, as indicated by arrows in the drawing. This auxiliary fire-place is preferably arranged over the short flue, *a*, but may be placed below or opposite to it, or in any other place where the heated products will be compelled to first enter the shaft before escaping into an outlet flue. The object of this fire-place is to make the ore cross the highly heated products therefrom, previous to being brought under the direct influence of the heated currents ascending from the lower part of the shaft, by which means the ore is brought to a condition for being more readily acted upon while falling through the shaft. Another advantage is that the flame from this fire-place, entering the shaft so near the common escape-flue, will pass into this flue along with the dust, which is either too light to pass below or which may be carried into the flue by the draft, and, mingling with the escaping heat and gases, will become thoroughly roasted before it reaches the dust chamber, E.

At the upper end of the shaft, A, there is a feeder, consisting of a hopper, H, having perforations or oblong slots through its bottom, and a corresponding perforated slide, *k*, so applied that, by giving it a reciprocating motion, the ore or substance to be treated will be regularly fed into the shaft. The slide can be adjusted so as to regulate the amount of material fed. Any other proper feeder may be used.

At the base of the chimney, N, there is a fan, M, which is rotated more quickly or slowly according to the force of draft required, and, to start the fire in the auxiliary fire-place, G, draught-dampers may be opened below and above the fire. These dampers are applied in practice opposite the passages, *s*, *t*.

Such is the best furnace for roasting ores. It has not been worked as yet and hence one cannot say just what the result will be. Yet high hopes are entertained of its success, and two furnaces are now in course of erection, one on Chicago Creek and one on Snake River.

shall await with great interest the results of running the two furnaces now being built.

The matter of having such furnaces as these is of great importance to our Coast. The Stetefeldt furnace has proved a success. But the high price charged for the right to use the furnace prevents many from having it. Hence everybody is still eager on the subject and all roasting furnaces are matters of paramount interest. If Colorado proves able to roast ores in this furnace more cheaply than has hitherto been done there, it will be a great advance for the territory, as well as for the whole land.

The Arey Patent Roasting Furnace.

We should be inclined to fear that some trouble might arise from the form of the shaft, and that the ore would collect on the planes marked *b* in the drawing, and render necessary a frequent cleaning of these places. Moreover, we are not quite clear as to the advantages of the auxiliary fire-place, G. Whether dropping the ore immediately into the great heat, which must exist between G and *a*, is the correct method and will not result in a partial smelting of the particles, might be a doubtful question. But these are points which will soon be made clear by practice. We

IMPORTS AND EXPORTS.—According to a telegram, in the August report of the Chief of the Bureau of Statistics, a full statement will be given of the imports for the fiscal year 1870. This shows a large increase of exports over the preceding year, although our imports still exceed the exports.

STEAM ENGINES.—The value of the steam engines exported from Great Britain, according to the *Berg. u. Huttenm. Zig*, was £1,417,270 for the first 10 months of 1867, £1,470,171, for the same time in 1868, and £1,429,499 for the corresponding period of 1869.

SUCCESSFUL TREATMENT.—The Colorado Register says that Cash, Rockwell & Co, in Chase Gulch, near Central City, are at last successful in their attempts to treat Colorado ores. They have tried the Plattner process, but found that the loss of precious metal was too great. After a series of experiments, lasting some 18 months, they have at last succeeded in getting a cheap process, by which the gold, silver and copper are all saved. In what this method consists, is not said, further than that it is closely allied to the French method of Bronpiere, and that the ore is crushed fine and roasted. We are going to look up the Bronpiere method, being obliged to confess to ignorance on the point. Is it a roasting, followed by chlorination according to Plattner and leaching according to Küstel and Hoffman?

THE San Diego County census has been completed. According to this, San Diego City has 2,301 inhabitants and 915 occupied houses, real estate valued at \$2,282,800, and personal estate valued at \$741,252. San Luis Rey, including Santa Margarita Valley and Los Flores, has 335 inhabitants, 81 dwellings, real estate valued at \$226,800, and personal estate valued at \$293,175. The Julian District contains 303 houses, 534 inhabitants, real estate worth \$108,095, and personal estate valued at \$88,409. Fort Yuma and Colorado River District has 17 houses (exclusive of military quarters), 102 inhabitants, and real estate valued at \$3,900. The total number of inhabitants in San Diego County, exclusive of Indians, is 4,787; of dwellings, 1,799. The total value of real estate is \$3,081,634.

THE BIG HORN EXPEDITION does not appear to have met with the success it expected. They were completely interdicted, says the Cheyenne Leader, from going on to the best lands for gold discovery, the Big Horn Mountains. At no place were paying prospects found as far as they went after leaving Sweetwater. Better prospects were found on Elk mountain, near the U. P. R. R., than at any other place. No Indians were seen. A part returned to Cheyenne, on the 24th of August.

LETTER-BOXES are soon to be placed in different parts of the city, attached to lamp posts, as at the East. The street-names are in many places attached to the lantern of the lamp, so that it is now possible for a stranger to find his way with much less trouble than formerly.

SCHOOL OF MINES.—The legislature of Colorado, at its last session, appropriated about thirty-nine hundred dollars for a building for a school of mines. The corner stone of that building was laid with religious ceremonies on Monday, August 15th, by Bishop Randall, in the presence of a large assembly of people. The Bishop delivered a pleasant address on the occasion.

QUICK WORK.—Two hundred and twenty tons of wheat, were put on board a ship at Oakland, the other day, in four hours time, and all through one port hole.

Communications.

IN THIS DEPARTMENT we invite the FREE DISCUSSION of all proper subjects—correspondents alone being responsible for the ideas they advance.

Notes of Travel in Placer County.

[Written for the Scientific Press.]

Forest Hill, its Mines, Scenery, etc.

Forest Hill is situated on the divide between the North and Middle Fork of the American river, and 22 miles northeast of Auburn Station. Although somewhat depopulated at present (on account of scarcity of water), it still contains about 250 enterprising inhabitants. The distance from Auburn Station is made in about five hours by Powell's stage line. For 15 miles of this distance there is the most beautiful view of any in the northern mines; to the southeast can be seen Georgetown, situated on the divide between the Middle and South Fork of the American, and on the northwest, Iowa Hill, on the range situated between the Middle and North Fork of the American River, and in the direction of Donner Lake, 75 miles of glorious scenery are open to your view.

The Mountain Co., superintended by C. Beckman (Forest Hill), have a tunnel in 2,600 feet, and a shaft down 90 feet. The mine is owned by a company of Germans, and employs, on an average, about thirty hands. They have a crushing mill, but make no use of it at present. Their average net proceeds, over expense, are \$1,000 per month. They work through the Baltimore tunnel. The Baltimore claims are very extensive and are owned by A. Hayward. Work was started on one of these (there are several) last fall, under the superintendence of P. Deidesheimer, but has been temporarily suspended; cause unknown.

The Jersey claim, owned by G. W. Reamer, is superintended by John Brown, and is now working seven men. This claim has paid exceedingly rich for many years, and although somewhat interrupted at present, its management has every confidence in a fortune being taken out in the next twelve months. The once immensely rich Jenny Lind claim is again being worked, with a good prospect of success. The Rough and Ready, pronounced worked out years ago, is about to be proven to the contrary by its present proprietors, Messrs. R. J. Glover and N. Hurtzig. Many other claims, of more or less note, on this ridge have a very extensive back channel, as yet almost untouched. The Mountain Co. only have worked such portion. All the claims on Forest Hill ridge extend through this back channel to the Devil's Cañon, but their tunnels all being too high, it will take big capital to open them down to the proper drainage. When this is done, success is certain. As a proof that the inhabitants here have a high appreciation of themselves and the place, I will state that they have the tallest liberty pole in the State, which is 220 feet high.

Neighboring Towns.

Yankee Jim's, at present almost depopulated, is situated three miles, a little south of west, from Forest Hill. Although millions of dollars have been taken out here, and thousands of men employed in doing it, if water is brought in here in any quantity (and with large capital this would be perfectly practicable), the same scenes will again occur. But two or three companies are now working, the principal one of which is Bradley & Co.

Todd's Valley is situated about three miles southeast of Forest Hill, and the same remarks made with regard to Yankee Jim's will apply here. Pond & Co. have a monopoly of its mines. The character of the pay dirt is cement gravel, but easily washed.

Bath, a small place situated one and a half miles farther up the divide, supports about 100 inhabitants. The pay here is found in a hard cement, which has to be thoroughly slacked before washing or crushing. The Paragon Mill Co. are the most successful, owning the principal lead and having a good mill for crushing. They work about 20 men night and day, and the dirt pays about ten dollars a day to the man.

Six and a half miles farther up the divide is Michigan Bluff. The character of the pay here is similar to that of Yankee Jim's and Todd's Valley—a slightly cemented, washed gravel, deep, paying from the top down. Hydraulic mining is the process of mining here, but, at present, water can be obtained only six or seven months in the year. They all live in hopes here of seeing Col. Von Schmidt's enterprise (of tapping Lake Tahoe) carried out, when, with plenty of water, the sound of the pick and shovel will be heard on every foot of this range. L. P. Mc.

Battle Mountain District.

[Written for the Scientific Press.]

EDITORS PRESS:—I have been a reader of your valuable journal several months, and have often sought it for the information it contains about mines and mining interests in all parts of this country. I notice, however, that but little is said about the mines in Battle Mountain District, Nevada. Having made rather a lengthy visit in this locality, and having become acquainted with the nature and qualities of many of its ledges, it seems rather strange that so valuable a section of mining country as this, should go so long a long time unnoticed and comparatively unknown. It may be that the shrewd proprietors of mining property here do not care to become notorious in their possessions, being satisfied with a good thing, and more disposed to quiet enjoyment than to noisy celebrity.

It will be no news to state that this camp is six miles by stage road from the station of the same name on the C. P. R. R. A good, but dusty road leads to it, and continues eight miles farther, by gentle ascent, to the town of Galena, in the same district. About half way between the two places, a little off from the road, you will see the Galena Smelting Works. They were commenced a few months since, and finished, as the proprietors supposed, to successful completion. Unfortunately, there was a difficulty somewhere beyond their intelligence, and almost a total failure was the result. But the experience so dearly bought convinced other parties that a favorable result could be obtained. In consequence, a stock company has been organized with ample means, other talent employed, and now all concerned have every reason to believe that a splendid success awaits their enterprise, and that the hopes of the new company will be soon realized. It is of the greatest importance to the prosperity of this district that such should be the case, as there are so many good ledges, both of copper and galena, to be worked, held by comparatively poor men, who have not the means to go through with the usual expensive mode of shipping their ores to distant places for reduction.

Further on the road towards Galena, you will find the "Butte," a silver mine of good reputation and splendid prospects. The cosy cottage and fine garden of its urbane superintendent, J. T. Maclean, Esq., are suggestive of wealth and permanency. It has been a self-sustaining mine from the beginning, and is owned by five gentlemen, none of whom have been called upon for a dollar to assist in its development. Several car loads of ore are shipped per week to the reducing works at Reno, Nevada, making very gratifying returns. It is in contemplation to erect a mill by which their low-grade ores can be reduced, thirty thousand dollars' worth of which, at least, now lie upon their dump.

Beyond Galena, farther up the cañon about three miles, is the famous copper mine belonging to an English Co., known as the "Battle Mountain Mining Co." It is truly a famous mine, and is, without doubt, one of the best pieces of mining property in this State. Their commencement was anything but encouraging. A shaft from 60 to 80 feet in depth was sunk without favorable results, but, having faith and perseverance, they continued to sink until an immense ledge was struck, producing ore forty, fifty and even seventy per cent. in richness. It is an incorporated company, fifty per cent. of its capital only having been called in. Its stock is now held at 113. D. W.

[To be continued.]

Rev. A. F. White, State Mineralogist of Nevada, came very near the end of his day by partaking of poisonous berries, a week ago.

Our Home Industries.

The Alvarado Beet Sugar Factory.

The impressions gained from a visit to this institution, were of a most favorable character. The general magnitude of the undertaking, the state of forwardness towards completion of the building and the placing of machinery, together with the cheerful confidence and well directed energy of the projectors, so appeared to an observer, as convinced me of the substantial nature of the enterprise.

Situate at the head of navigation, upon the north bank of the Alameda Creek, which comes winding among groves of trees from the cañon, several miles away, through which the Western Pacific Railroad passes eastward, it is most favorably located in the midst of cultivated fields, and beautiful landscapes.

The main building is 50 by 150 feet, 2½ stories, with a large tower, for the accommodation of certain portions of the refining works. The building contains numerous rooms, some of them closely sealed to prevent the escape of heat. There are also wings and sheds for various purposes. On the first floor there is an office, while on the second, in a secluded place, is a chemical laboratory and test room.

A wharf 60 feet long, to be extended 150 feet, rests upon piles that find a solid bottom at 12 feet, which shows the solidity of the foundation, or deposit beneath.

Over 250,000 feet of lumber is required in and about the buildings—instead of 78,000 as has been reported.

The Capacity of the Mill

Is 50 tons of beets for each 24 hours; and as the soil here will yield about 40 tons of sugar beets to the acre, only about 400 acres will be required to produce a sufficient quantity of beets to keep the mill busy the year round. There is that number of acres under cultivation this season, at a contracted price of \$3.50 per ton. This price, as low as it appears, will allow the producer about \$140 per acre. And if 8 per cent. of the gross weight of beets is sugar, a low estimate, each acre will yield about 5,000 lbs of sugar, while the factory will make 6,550 lbs daily, which at 8 cts. per lb. would be worth \$500. Allowing \$175 as cost of beets—the manufacturer will receive \$325 for a days work at these figures.

The Incorporation,

Including about a dozen stockholders, represents a subscribed capital of \$250,000, which will probably fall short of the expenditures necessary to the completion of the works.

The company own nearly 100 acres of land where the factory stands, purchased of Mr. E. H. Dyer, who has a fine residence nearby, and is one of the prime movers and owners in the sugar works. The land owned by the company is planted with beets. Mr. Dyer says that with a drilling machine, such as he uses, one man and two horses can sow ten acres of beets per day, and do it well; and that the cultivation, on land well prepared is not very expensive. I examined several fields of beets, and in every instance observed a fine and luxuriant growth. They can be planted at any season almost and be sure to grow, where a sufficient amount of moisture is present. But in early spring is the favorite time of sowing.

The Machinery

Of the sugar factory, except the centrifugals which are ordered from Germany, has all been made in San Francisco, by Booth & Co. Three Engines, one of 12 and two of 40 horse power each, will furnish the driving force, for the working of the machinery. The beets will be first taken by machinery into a

Wash Room

Some 50 feet square, where they will be thoroughly cleansed from all adhering dirt. They will then be elevated into the

second story, where

The Grater,

Will convert them into a fine pulp, which will be passed into another room upon the same level and submitted to the

Centrifugals,

Of which there are 10 large ones. These, by rapidly revolving, will force or strain out the juice. The refuse, dry pulp, is to be carted to the yards and fields for the live stock, which will be fed upon it. This is an item well worth the consideration of stock men.

From the centrifugals the juice will be passed into the

Defecating Pans

Where it will remain until it attains to 68 degrees of heat. It is then forced through "Montejucos" into the Saturation Apparatus in the tower of the building, where steam is made to act upon the juice. It passes thence, through five immense, long upright Filters made of boiler iron, and filled with animal or bone charcoal. From thence it goes into the Evaporating Pans, where it is boiled down to a syrup.

This Syrup is then transferred to a Vacuum Pan, where it will be boiled to the point of crystallization. The sugar, still in the syrup, will then be crystallized in pans, after which it is placed in Sugar Centrifugals, where it will be freed from the syrup, and both sugar and syrup be afterwards made ready for market.

The building was started about 4 months ago, and will be ready to commence operations sometime in September. Very little of the machinery was in place at the time of my visit, so that this description is dependent upon my understanding of another's explanations without seeing much myself.

Every process of heating will depend upon steam. The furnaces and boilers are works of considerable magnitude. A kiln is prepared, where the charcoal fouled by filtering, will be re-burned and purified from all absorbed particles. Some 75 tons of bone-coal will be required to do the filtering for this season.

As the factory will be run night and day, about 100 hands will be employed in and about the works.

The only successful Beet Sugar Manufactory ever started in the United States was the one operated by Messrs. Bonesteel and Otto, at Fond-du-Lac, Wisconsin.

The great promise of superior inducements and facilities offered in this state, caused these gentlemen to embark in this enterprise. Their ample experience in Europe and America, has given them perfect familiarity with the working of all the necessary details and complications incident to such business.

Mr. Otto received a diploma at the Paris Mineral Exhibition, in 1867, for the best sample of crystallized sugar manufactured from the beet. Mr. Bonesteel, showed me four grades of beet sugar, made by them at Fond-du-lac. Sample No. 1 was beautifully pure granulated crystals, not to be excelled by any. No. 2 was refined like crushed sugar, of pure white and sweetness. No. 3 was the color of light coffee sugar, with a slight beet flavor; while the 4th lot was of a clear brown, of lively appearance, but of rather decided beet taste.

Artesian Wells.

An artesian well of 7 inch bore, 205 feet deep, which stands at a temperature of 64 degrees, and will raise water of clear and excellent quality, some 12 feet above the surface, will supply the factory. Mr. Dyer has one at his house, but a short distance away, that is 270 feet deep and shows a temperature of 65½.

Several other wells have been bored in this vicinity which yield an abundance of very excellent water.

Conclusion.

A desire to give some correct information as to the importance and magnitude of this enterprise has induced your correspondent to take an interest in giving this detailed description. The undertaking is a most important one, and is backed by men that can hear to loose, but who are determined and can afford to win.

The successful working of this, will surely incite others to erect similar works. There are many thousand acres of land that will grow the sugar beet to perfection that need reclaiming, and which this, if a full success, will speedily bring into usefulness. The probable limit of the manufacture of sugar from beets in California, will be a supply of the article in sufficient abundance to reduce the price below a living profit. When this hopeful condition of things is reached, California will be the largest sugar producing district in the world!

S. H. HERRING.

Mechanical Progress.

SEPARATING THE METALS OF AN ALLOY. C. S. Eyster, of Colorado, has patented a new plan for doing this, which is based upon the different specific gravities of the metals constituting the alloy, and their consequent tendency to arrange themselves at different distances from the center of a cylinder in which they are rotated rapidly while in a state of fusion. His idea is, that when the rotation of the cylinder has been kept up long enough to allow the different metals thus to arrange themselves in concentric rings, the furnace underneath may be withdrawn, and the metals allowed to cool;—the rotation being, of course, continued until they become hard. They may then be separated by turning off in a lathe,—each in its order. It does not appear that the practicability of this plan has as yet been tested to any very great extent.

LAROE STEEL CASTING.—The Sheffield (England) *Telegraph* describes the recent casting of a block of steel weighing over fifteen tons, for a steam-packet screw-shaft, fifteen feet in length and four feet in diameter. "The work of melting the steel commenced about eight o'clock, in five hundred and forty-four crucibles—each containing sixty-four pounds—the total quantity thus being 34,816 pounds, or fifteen tons, three quarters, twelve pounds. About half-past twelve the work of casting commenced. With 544 crucibles to empty into one mould, the difficulty of procuring a steady flow of metal at an equal temperature was very great; but so admirable were the arrangements, and so enthusiastic the interest which the workmen individually took in the process, that in half an hour it was triumphantly accomplished, without the slightest accident. Silently the stream of workmen approached with the crucibles, and as silently retired in the opposite direction, till one could not resist the idea that he saw the result of military training. * * * Ten or twelve years ago, the correct casting of an ingot of fifteen cwt. of crucible steel was considered as great a triumph as that of fifteen tons now is. The weight of an ordinary crucible steel ingot is only about forty-five lbs. There were nearly 300 men engaged in the work of casting."

DOUBLE FURROW PLOW.—The *Engineer* of July 29th, illustrates a plow exhibited at the late Oxford Show by Ransome & Co. We quote a part of the description, which will give an idea of the manner in which the plow is lifted out of the ground; the great objection to this kind of plow having heretofore been the difficulty of doing this, on account of the great weight. "A handle somewhat similar to the reversing lever of a locomotive, will be seen between the plow stilt, and a pair of wheels between the beams. When at work, these wheels are in the air. They are mounted in a peculiarly formed frame, provided with a pair of tires. Just before the headland is reached the plowman throws forward the stilt lever, and by doing so brings down the tires, the points of which catch the ground, and as the horses proceed they are forced backwards, thereby bringing down the wheels, which take the weight of the plow and lift it out of the land without further exertions on the part of the plowman; by drawing back the stilt lever, the plow is dropped into work again."

POWER REQUIRED FOR CIRCULAR SAWS. The *Builder* says: "The size of saws has nothing to do with the power required; that is determined by the width of boards to be sawed. In sawing pine logs, generally, one-horse power will be sufficient to make one foot of inch boards per minute. This leaves the momentum of the fly wheel, etc., out of the question. The advantage gained by the use of fly wheels is great. A 24-horse power, with this aid, will saw as much lumber in twelve hours as a 48-horse power in the same time without it."

COPYING PRINTED MATTER.—A late patent is for a preparation, by means of which impressions may be taken of the printed portion of a bill of lading or other document, as well as of the portions which may have been written with copying ink; and this, too, months after the first impression. So says a Philadelphia paper.

SOMETHING NEW IN PHOTOGRAPHY.—M. Bazin,—says the *Mechanics' Magazine*,—has made the curious discovery that the short time now required for the exposure of a plate may be still further diminished one-third, by adopting the following plan: "M. Bazin makes four holes in the front of the camera, and fits them with glass colored by a solution of carmine in ammonia, behind which he places another piece of unpolished glass. These holes are uncovered at the same time as the lens, so that the red light falls upon the plate simultaneously with the image through the lens. According to the statement of the author, the blacks and high lights are by this means much softened and the half tones greatly improved. The same effect is said to be produced if the sensitized plate be exposed to red light either before or after the picture be taken; in the latter case, of course, before the image is developed. He finds no such effect produced by the use of glass of any other color."

DANK'S ROTARY PUDDLER.—The Cincinnati *Gazette* pronounces this an established success. Recent experiments, continued for several days, gave "a superior quality of iron or muck bar from a given quantity of metal; a larger yield than is possible in a hand furnace, averaging ten per cent.; an increased quantity puddled of fifty per cent.; a saving in coal of thirty per cent.; of labor the same, and a saving of repairs and materials; a saving in cost of construction, based on product of furnaces; an ability to work a quality of pig iron or old castings difficult to puddle in hand furnaces, and to produce puddled balls of any weight required. It can produce iron or steel at pleasure from puddled balls of sufficient weight to make a solid rail from a homogeneous bloom, of better quality and cheaper than by any other furnace."

COLD TANNING AND SILVERING.—A French iron master patents this process for tanning iron wire for cards and wire cloth. A solution is made as follows:—"To every twenty gallons of water add 6 lbs. of rye flour, and let it boil for half an hour; filter and add 112 lbs. pyrophosphate of soda, 34 lbs. crystallized salt of tin, 134 lbs. neutral protochloride of tin, and from 3 oz. to 4 oz. of sulphuric acid. When the salts are dissolved the solution is distributed in wooden vats, a little water being added to the first two or three. The wire is passed successively through the whole and through draw plates at intervals. For silvering he uses, in place of the salts of tin in the solution, cyanide of silver and cyanide of potassium."

IRON TELEGRAPH POLE.—The Philadelphia correspondent of the *Iron Age*, thus describes a new "telescopic tubular iron telegraph pole":—"The pole is made of the best wrought iron, in three tubular sections of 8 feet each for city use, and but two for country. These sections are connected by "reducing couplings," and are of the following diameters: At the bottom, two and a half inches; second section, two inches; and third, one and a half. The base attached is fifteen inches in diameter, with four lugs attached, each four inches square, with inch and a half holes at the extremity of each, for the purpose of dogging or keying in soft, marshy ground. The pole weighs including base but 125 lbs. Being telescopic, the upper sections sliding into the lower one, it occupies for transportation a space of only eight feet."

BLEACHING BY PERMANGANATES.—The manufacture of the permanganates being now comparatively inexpensive, they will doubtless come largely into use for bleaching purposes. The *Manufacturers' Review* thus describes the manner of using them:—"The tissues to be bleached are cleansed by hot water, and freed from grease in an alkaline bath. They are then immersed in a bath which contains a solution of permanganate of potash or soda, to which is added a salt, such as sulphate of magnesia. After immersion fifteen minutes, the goods are taken out and placed into baths which contain sulphurous acid. In these they are left till the covering of oxide of manganese formed is removed; they are then washed clean. If the color is not yet sufficiently white, they are again dipped into a bath of permanganate, washed, and again passed into a bath of sulphurous acid, concluding with another washing. The treatment is repeated till they are perfectly bleached. A bleaching bath, which contains, according to the nature of the fiber, 4—10 pounds of permanganate of potash or soda, suffices to bleach 200 pounds of cotton, flaxen or hempen tissue."

Scientific Progress.

SECRETION NOT MERE SEPARATION.—The cell is the histological unit which consists of nucleus and plasma. The function of the cell is secretion. We give here two or three detached paragraphs from a paper by J. Gedge, M. R. C. S., which we find in the *Bordeaux Scientific Review*:

"Formerly, secretion was regarded merely as separation. The blood was supposed to contain all the complex substances poured out by different glands, and it was simply the duty of the gland-cell to choose from the blood, as it flowed by, the particular substance that it was required to separate. Now, however, the gland-cell is known to fulfil a more important office. Formation rather than separation, would appear to be the function of the gland-cell. It would seem to attract the nutrient material in its vicinity, and with the unknown machinery to make use of chemical affinity to construct elaborate compounds. But we cannot gauge the action of a gland by merely analyzing the secretion poured out, for there can be little doubt that all glands compound for the blood as well as for their own secretion. * * The blood flows through the glands, bearing with it secretions from every tissue of the body. Is it difficult to understand how the resulting product of the ovum and spermatozoon may inherit the peculiarities of both parents? The notion is, I think, preferable to Mr. Darwin's modern theory of Pangenesis. * * Each nucleus would seem to be a battery, the construction of which we have at present no means of finding out. We see how forces can be correlated with its force, and we are thus able to study its affections; but we know no more of its construction than of that combination of matter which sustains chemical action, furnishing heat and magnetism in the earth's centre. Thermo-electricity and the hypothesis of Grothuss start us with ideas of what goes on during the incubation of an egg, but fall short of furnishing us with a parallel phenomenon. Physiologists boast of our being able to construct such organic secretions as alcohol, oil, and urea, but this is quite beside the question. The day may come when the chemist in his laboratory may out of stones make bread, but I see no reason to think that he will even in that day do it with other than the comparatively clumsy apparatus with which he has constructed his alcohol and urica."

GEOGRAPHICAL DISTRIBUTION OF RACES. At a late meeting of the Ethnological Society in London, Prof. Huxley read a paper upon the "chief modifications of mankind and their geographical distribution." He described five distinct types,—as follows: 1. The *Australoid*, with slender limbs, dark brown skin, black wavy hair, strong brow-ridges, and long skull; this type is found throughout Australia, among the hill tribes of the Dekhan in India, and formerly in the Valley of the Nile. 2. The *Negroid*, with dark skin, black frizzled hair, and long skull; a group which includes the Negroes and Bushmen of Africa, and the Negritos of New Guinea, Tasmania, &c. 3. The *Xanthochroic*, with fair skin and blue eyes, distributed through Iceland, Eastern Britain, Scandinavia, North and Central Germany, and extending through Eastern Europe into Asia, as far as Northwest India, and found also in the North of Africa. 4. The *Melanochroic*, a type with dark complexion, occupying an area situated between the Xanthochroic and Australoid peoples; and 5. The *Mongoloid*, a large and somewhat ill-defined group extending throughout Central and Northern Asia, the two Americas and Polynesia.

LIQUEFACTION OF ROCKS.—"Pressure prevents fusion, when it is, as in most instances, a process of expansion, but favors solution, which is, with few exceptions, a process of contraction. Now since I place the seat of volcanic action in a region where solution, rather than simple fusion, is the cause of liquidity, I am led to consider pressure as one of the efficient causes of the liquefaction of rocks, and to regard its diminution as leading to solidification."—Prof. T. Sterry Hunt.

TO OBTAIN OZONE.—Behind the short flame of a Bunsen burner a large beaker is placed, with the opening to the flame, and a current of air, by means of a tube, is blown through the flame into the mouth of the glass. This, after a few seconds, is covered with a glass plate, on removing which the characteristic odor of ozone will be perceptible.—*Gas Light Journal*.

ARTIFICIAL COAL MAKING.—"M. Baroulier invented an apparatus in which vegetable matters enclosed in moist clay and powerfully compressed, were to be exposed to temperatures of 200 degs. to 300 degs. kept up for some time, in which the organic matters combine, and form a substance analogous to coal, lignite, or peat. As his apparatus, without being absolutely airtight, offers an impediment to the escape of vapours and gases, it follows that the decomposition of the organic matters is effected in a space which is saturated with moisture, and under a pressure which impedes the desiccation of the elements of which they are composed. These circumstances are very nearly the same as those of nature during the geological epochs in which coal and lignite have been formed. Operating in this manner then with the sawdust of woods of various kinds, M. Baroulier has obtained matters whose appearance and properties sometimes remind one of bright coal, and sometimes of a dull coal, which is met with in different kinds of fossil combustibles; and stems and leaves of plants laid between beds of clay in the same conditions are transformed into a layer of coal very similar to that which is met with in coal schist."—*La Houille*.

REGION OF THE SNAKE AND COLUMBIA RIVERS.—The following paragraph is from a lecture delivered by R. W. Raymond, before the Geographical Society of New York:—"The characteristic formation of the Snake and the Columbia above the Cascades is basaltic—the product of vast lava overflows. The sublime group of mountains in Oregon and Washington, which includes Hood, Adams, St. Helen's, Rainier, and Baker, with others scarcely less magnificent, is volcanic. Some of these peaks have been in active eruption within recent years; and all are known to have been so at some former period. But we have not to look for volcanic craters as the centres of the great lava floods which covered so much of Northern California, Oregon, Washington, and Idaho. These craters are scattered along a distance of five hundred miles in the Cascade and Sierra ranges, but it seems probable that a line connects them, upon which the eruptions of melted lava took place abundantly, repeatedly, but perhaps more silently than is apt to be the case with the explosive phenomena of volcanoes. A plutonic dyke may be traced along the sierra, and is asserted to have been observed in a considerable sectional exposure in one of the deep side cañons of the western slope."

MINING TOOLS FROM SINAI.—W. Boyd Dawkins, F. R. S., at a late meeting of the Manchester Philosophical Society, exhibited some flint mining tools brought by M. Baerman from the turquoise mines of the promontory of Sinai. These mines were worked by the Egyptians from the third to the thirteenth of the dynasties mentioned by Manetho. Ample evidence was brought forward to show that these stone hammers and chisels were used for breaking up the rock by the miners. Hieroglyphic inscriptions in the neighborhood, relative to these mines, were also evidently cut with similar tools.

CHEMICAL AGENCY OF LIGHT AND HEAT DISSIMILAR.—"A series of experiments on the relations of oxalic acid to metallic oxides, induced Doehereiner to draw the inference that the chemical influence of light is very rarely analogous to that of heat, and that it is *sui generis*; that the one determines a contraction, the other an expansion, of the matter, and that the reductive action of light is a consequence of the contractive force of that agent, while the effect by which heat promotes combustion and almost every kind of chemical penetration, is the result of the dilatation of the matter occasioned by it. The cause of that opposition of effect is unknown, and we can scarcely hope to discover it, when we reflect with what facility light is transformed into heat, and *vice versa*."—Prof. Wurtz.

DISTINCTION BETWEEN ANIMALS AND VEGETABLES.—Professor Rolleston, of Oxford, in his late book on "Forms of Animal Life," gives a new criterion by which to distinguish animals from vegetables. He says that in the case of all animals the embryo absorbs its yolk from the inside, which in vegetables the germ of the seed is surrounded by its albumen. This is a fore-shadowing of the way in which the adult animal or plant absorbs its food; the former places it within itself for digestion and assimilation, while the latter takes it from outside.

Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

California.

ALPINE COUNTY.

LEVIATHAN.—*Miner*, Aug. 20th: A contract has been let to run the tunnel 200 feet further.

TARSHISH.—*Chronicle*, 20th: We hear that some ore was yesterday struck in the lower tunnel, but have not learned that any great body has been encountered. This tunnel may be run 100 feet further to reach the ledge. The indications are good.

CALAVERAS COUNTY.

RICE.—*Chronicle*, 27th: On Thursday we were shown, by A. M. Harris, of Sandy Gulch, a "chuuk" of amalgam weighing \$3,500. This was the product of 43 tons rock from the "Col. Avery" or "Woodhouse" mine. This is an average of \$81 40 per ton, for unassorted rock. The lead is wide, well defined, and of unexampled richness throughout. Gold is visible in all the rock. Good judges estimate at least \$20,000 in sight, within a space twenty-five feet in length. This mine was abandoned by a company of English capitalists, who could not make it pay. It was sold at sheriff's sale for taxes and bid in by Mr. Harris, who commenced by sluicing down to the lode on the northern end, disclosing rock that will pay from \$80 to \$1,000 per ton. A large amount of money has been already been taken out. The forty-three tons of rock were mined by three men in two weeks.

RICH GULCH.—The Palomo mill, 36 stamps, is running day and night. The shaft is sunk 300 feet and the rock is being "stoped" out. Forty miners are employed. Alexander & Co. are working industriously. Their mill, a 10-stamp, is crushing a great deal of rock with good results. The mine has paid steadily from the commencement.

INDEPENDENCE.—Cor. of same: Lewis Bros. have run their north level 135 feet from the shaft. They will have their 5-stamp battery running this week. At the Lefoy mine they have sunk 170 feet, and have a 3½ feet ledge which looks well. Buckeye will complete their whim this week.

EL DORADO COUNTY.

GREENWOOD VALLEY.—*Georgetown Cor.* of Placerville *Democrat*, Aug. 27: The owners of the French claim, are running a new cut from the ravine, which will give forty or fifty feet more depth. The work heretofore has been done by ground sluicing. Lately they have fitted up a hydraulic. The Negler claim, is the only one at present working. They are into the hill two hundred feet. They do their own work with a hydraulic. They use from one hundred and forty to two hundred inches of water. The rock is very soft, and of little trouble to cut down with water. The "Never Sweat Claim," has been working up to ten days since when water failing, they had to suspend. Next north is the "Spanish Claim," or as it has been christened by parties in San Francisco, who came up and purchased the mine, "The Glenwood Mill Co." They sent up a man of that class whose aim seemed to be to see how big a show he could make. The result has been that they had to suspend operations. Another claim, owned by Nagler, Greenwood & Co., which went through the same experience and wound up, will get a U. S. Patent, and go on success under men who don't wear kid gloves.

INYO COUNTY.

COSO.—*Independent* 22d: This is 55 miles from Lone Pine. It was abandoned in 1866 on account of Indians. In '68 a party of Mexicans settled there, and have now 20 arastras at work. The ledges are small, and mostly lie flat, but are very rich. The greatest abundance of ore is found in the Mina Grande, formerly the Josephine. The gold bullion produced is worth \$15 per ounce, and the product between April and October, is estimated at between \$30,000 and \$40,000.

GOLCONDA.—This mine two miles from Owens River, was located two years ago but little work was done. Capt. Chase intends to have some of the very rich looking ore tested. A thousand tons could easily be taken out. Good chance for capital.

The Los Angeles *News*, of 27th, says:—Yesterday the train from Cerro Gordo arrived, with three hundred and thirty-five bars of bullion, weighing twenty-one thousand nine hundred and twenty-one pounds.

LASSEN COUNTY.

Yreka telegram of 30th:—The new diggings in Big Valley, discovered by Haskins

& Co., are turning out richly, but only one spot of pay-dirt has been struck. From that they realized from two hundred to five hundred dollars per day to the hand, with a rocker. The new district is twelve miles south of the Siskiyou County line, in Lassen County, forty-five miles from Susanville.

NEVADA COUNTY.

GOLD BRICK.—*Gazette*, 25th: A brick weighing 87 ounces and worth \$16 an ounce came down from the Star mill yesterday.

NUCKET.—*Transcript*, 28th: A nugget of gold, weighing nearly 21 ounces, was picked up in the claims of the Omega Co., on Thursday. Quite a number of respectable nuggets have been found in the same diggings during the summer.

ITEMS.—Grass Valley *Union*, 24th: Yesterday the Seven-Thirty mine sent up specimens valued at between \$1,500 and \$2,000....The Tornado is working with good results. The shaft is down 40 feet on the incline....The Grant mine had a crushing at Perrin's mill. There was much waste rock crushed. The yield was \$18 per ton. The Grant has yielded \$80 per ton.

ALTA HILL.—Same of 25th: The Hope Gravel Co., after more than two years of hard work, struck rich gravel on Tuesday. A drift has been run from the bottom of the shaft northeasterly 225 feet. This runs 25 feet in a body of gravel which prospects 50 cents to the pan. The bed is two feet six inches thick, and of a width not yet known.

SPRING HILL MINE.—The ledge in the shaft is two feet thick, on the average, and two crushings have been taken out recently. A crushing of ten tons was made a week or two ago, and paid \$10.47 per ton.

ITEMS.—Same of 26th: The situation was never better. The older mines are doing well, and many are being opened. The Eureka yields from \$2,000 to \$2,500 per day. Without going down another foot there are "backs" in the mine sufficient to last the company three years. The Wisconsin develops well. The mine is worked under a lease, by miners who put in their own time, and are making good wages, after paying the company a percentage of the gross proceeds. Last week the blanket washings cleaned up for the month \$1,040, which indicates a yield of \$5,000 from the mill, excluding sulphurets. The Idaho has been having a reconstruction at its hoisting works. The mill is now running night and day. The Empire, Ophir Hill, has another ledge under the one which has been worked. This is making a new mine of it. The rock now going through is good. The North Star has also an under ledge which is rich in mineral. The lower level east is showing rich rock. The Allison Ranch is preparing to put up its new fifteen-stamp mill. A Rawlins & Stevens separator has just been put in. The Dromedary is to be started soon by a company which has leased the mine and machinery. Perrin's mine and the Grant, on Wolf Creek, are worked with vigor. The Bowers, Seven-Thirty and Tornado, at the head of Squirrel creek, are employing all the hands that can be got into them to advantage. In gravel mines, the Hope, on Alta Hill, seems to be taking the lead. On Wednesday the Supt. washed out \$700, using a common pan. It is said the gravel is four feet thick. On Randolph Ridge, a continuation of Alta Hill, there are several companies at work. Webster & Co. are running in gravel which has some gold. The Picayune Co. are busy. Roberts & Co., McSorley & Co. and others are making the ridge lively.

HOPE GRAVEL MINE.—Same of 27th and 28th say that proof grows hourly stronger that they have the regular lead and a very rich one.

GOLDEN GATE.—28th: The ledge is from one to three feet in thickness and shows free gold. The Co. have a fifteen-stamp mill, with pumping and hoisting machinery.

BADGER.—The ledge was struck yesterday, at a depth of 190 feet. It is a large one, and heavily charged with sulphurets.

BIG YIELD.—About forty tons of rock from the Greenhorn mine, Osborne Hill, has just been put through the mill. The result is, in round numbers, \$11,000.

PLACER COUNTY.

GRAVEL MINE UNDER A FARM.—*Stars and Stripes*, 25th.—In the lower end of the county, operations are profitably prosecuted in the claims of Crosby & Baker and Saunders & Cartwright. The gravel deposit underlies, at a depth of ten or twelve feet, a bench of non-mineral arable land. The deposit has been traced from Newton upward for six miles, varies from two hundred to three hundred feet in width, and from a few inches to several feet in thick-

ness, and is demonstrably an old bed of Doty's ravine. The claims are worked by sinking shafts and drifting, and though not extraordinarily rich, the pay is steady. Cartwright and Saunders hold twelve hundred feet along the old channel, and work their mine during intervals of leisure on their farm. Mr. Cartwright and two boys, at their last cleaning, realized one hundred and eighty dollars for sixteen days work.

SAN DIEGO COUNTY.

JULIAN DISTRICT, Telegram, 26th.—Reports to last evening say a new mine has been struck near the Helvetia, called the Gilmore. The lode is only ten inches wide, but rich. Four pounds of ore crushed in a mortar yielded \$1.25. Thirty tons of Helvetia have been crushed, yielding an average of \$30 to the ton.

SIERRA COUNTY.

GIBSONVILLE.—Cor. of Butte *Record* 27th: The North American claim, was sold the other day to parties in San Francisco, for 95,000. It has worked thirty men for six years, with big profit to the owners, who are miners.

CAMPTONVILLE.—The Downieville *Democrat* says the Von Humboldt mine is erecting a ten stamp mill, which will be running by Sept. 1st.

SISKIYOU COUNTY.

QUARTZ MILL.—Yreka *Union*, 24th.—The machinery for the Morning Star, on Salmon, is now in Scott Valley. The mill will be ready to run, perhaps, by the 1st of October. The ledge prospects equal to either the Black Bear of Klamath, both of which are paying largely.

PIT RIVER MINES.—Ehlers, Haskin & Co. report a rich claim, but say there is nothing outside that will pay. They made over \$500 in one day with a rocker. The only water is from a spring. The gold is exceedingly fine and is in a stratum of dirt 4 inches thick, and 4 feet below the surface.

TRINITY COUNTY.

THE DEEP HOLE.—*Journal*, 27th: We visited the shaft being sunk by subscription. It is down forty feet and now sinking through a layer of tough cement containing gold.

QUARTZ.—Mr. Silcox, of Indian creek, informs us that the ledge in his claim, continues to improve. A ledge has been discovered on the Southfork, which contains sulphurets and free gold.

YUBA COUNTY.

BROWN VALLEY.—*Appeal*, 26th: The Dexter Co. has struck a ledge of partially decomposed quartz three feet thick, literally "lousy" with gold. They took out 300 pounds of the stuff on Wednesday.

SUCKER FLAT.—Telegram, 25th: The blast of twelve hundred kegs of powder (thirty thousand pounds) was exploded in the Smartsville Consolidated Hydraulic Mining Claim, at 7:20 P. M. It was a perfect success.

Nevada.

COPE DISTRICT.

ITEMS.—Elko *Independent*, Aug. 27th: The Argenta shows a larger body of ore than ever....The Crescent shaft is down 228 feet with a four foot ledge, carrying 18 inches of very rich ore....The Ida Gosage is three feet wide one hundred feet from the surface. The ore is superior and carries gold....The Excelsior is worked day and night....A body of very rich ore has just been cut at the Estelle. The ledge is four feet wide with good walls....The Mammoth and Great Eastern have out 400 tons of ore....Several rich discoveries have recently been made in Bull Run, Brno and Fairweather districts.

MILL FOR COPE.—*Chronicle*, 25th: F.W. Crosby is negotiating for a mine in Cope. He has his mill and machinery, in North Carolina, where it was built to work gold rock. The mill will be shipped to Cope via New York.

SPIRITUAL.—Capt. Cook, of Cope, learned from a medium in Chicago that in a certain direction, so many feet from the main shaft of the Monkey ledge, at the depth of twelve feet, he would find a very rich four foot ledge, and that at twenty feet it would increase to twelve feet. The Captain a short time since told some men, and they undertook to find the ledge. Sure enough at the depth of twelve feet they uncovered a strong four foot ledge on which they are still sinking. Specimens assay as high as \$15,000 per ton.

TREASURE.—Shipped from Cope, in half a week, \$2,328.

COPPER.—Two large veins discovered 25 miles northeast from Elko. One is 400 ft. wide, and the other 40 ft.

ESMERALDA.

DUNDERBERG.—*Gold Hill News*, 26th: The most recent test is a sack of ore worked

last week, from the stope leading to the tunnel. It assayed \$106 51 to the ton, and milled \$87 75. The company have now a ten-stamp mill in course of erection.

WIDE WEST.—*Loyal Independent*, 22d: The mill was purchased four or five months ago by A. L. and J. L. Greely, who have fitted it up. Banning, has leased the Antelope, and is doing well.

HUMBOLDT.

OREANA.—*Silver State*, Aug. 26th: W. H. Stront has resumed work. His furnace runs finely, and stacks of metal can be seen. He will ship during the week fifty tons of metal. Drake, of the old Montezuma, commenced work a few days ago. He is repairing the mill part of the works. He intends running two furnaces at once, and has shipped fifty tons of metal this week.

STAR.—The Sheba, which has been running fifteen men, was compelled to reduce its working force on account of water failing. The hands however, are in very rich ore, and the mine never made a better showing. The DeSoto is working 8 men, and yielding fine concentrating ore. Six tons shipped this week will average \$400 the ton.

UNIONVILLE.—Telegram, 24th: New discoveries are made every day. A rich strike was made lately, in the Hector, formerly the Monitor. They have a vein of ore three feet in thickness, all rich.

The quartz mills are steadily running, and the amount of bullion shipped is 920 pounds per week, worth \$9,000.

REESE RIVER.

BULLION.—*Revelle*, 22d: Nine bars of silver bullion, weighing 359 pounds, value \$3,977, received from Hot Creek, by Paxton & Co. on Saturday.

BULLION.—AUSTIN.—Same of 23d: The Manhattan Co. shipped last evening, seven bars of silver bullion, weighing 626 pounds of the value of \$10,450 31. Same shipped next day, \$18,273.

BELMONT.—25th: Six hors of bullion, valued at \$4,576 00, were received from Belmont last evening.

THE MINES OF BELMONT.—Same of 24th: Capt. Rock tells us: No camp ever had a more flattering prospect, but few camps ever extracted ore of such uniform high grade, averaging over \$200 per ton. Mr. Canfield is shipping a mill which will be running in two months. Leon & Co. are to erect steam hoisting works.

WASHOE.

OCCIDENTAL.—Gold Hill *News*, 27th: The new mill started up Tuesday, and is running well on ore from the lower tunnel. The mill runs twenty stamps, is most excellently constructed in every respect, and eligibly located, 300 yards below the mouth of the lower tunnel, being supplied with water by the stream flowing from the tunnel itself. This tunnel has been straightened and put in complete order. It is 1720 ft. in length. The winze between the upper mine and the lower tunnel develops a continuous body of ore 400 feet in height and from eight to twelve feet in width, sufficient to run the mill for years. The ore is all of low grade, averaging, perhaps, \$15 per ton, but owing to its evenness, it can be definitely figured upon.

CHOLLAR-POROS.—Daily yield 275 tons. The principal supply is from the Belvidere section.

YELLOW JACKET.—Daily yield 225 tons, from the 800 and 900-foot levels, through the south shaft. The drift north at the 1,000-foot level is still going ahead in softer vein-matter.

HALE & NORCROSS.—The sinking of the main shaft deeper for a new level is progressing favorably. The north and south ore breasts at the lowest level continue yielding well.

SAVAGE.—Daily yield 45 tons, all from the eighth level. The ore shows considerable improvement. Drifting is prosecuted to strike the rich ore at the north line.

GOULD & CURRY.—The body of ore developed last week proves to be richer and more extensive than at first supposed.

KENTUCK.—This once famous mine is "played out." It was yielding so little ore, and that of such poor quality, that the company thought best to shut down.

SACRAMENTO ANN MEREDITH.—The ore shows improvement toward the north, but it all yields well, and both mine and mill are doing excellent work.

HOPE.—The ore on the fourth and fifth stations has improved. Taking out forty tons daily, averaging \$22 to \$25 per ton. Two mills are kept constantly running.

CROWN POINT.—Daily yield 50 tons, low grade, averaging \$12.50 under the stamp. Prospecting drifts show only barren vein matter.

IMPERIAL-EMPIRE.—The bottom of the shaft is in lively quartz, showing an occasional trace of metal. Plenty of low-grade

ore in the old upper mine of the Imperial. BELCHER.—A few tons of low-grade ore from the 152-foot level. The 420-foot level is being re-opened.

CALEDONIA.—Connection having been made with the old American shaft, ore is being extracted through it from the 200-foot level at the rate of 40 tons per day.

Mormon Currency.

The *Overland Monthly* for September is a solid number. Thereby we do not wish to say that it is heavy, notwithstanding any idea of the correlation of solidity and weight which may float in the public mind. Our solidity here means good measure, although (we must confess it) our ideas as to the good measure are this time drawn from a rather hasty perusal of a number of its pages. [This was written for last week's issue.] We reserve its special study for a quiet, unhurried after-dinner hour. If anybody wishes a slice about Utah, he (or she) can read the following:

The Mormons reached Salt Lake Valley in an utterly impoverished condition. The cash capital of the entire community would not probably have exceeded \$1,000. The California migration furnished them a market for their surplus products; but, as they had but small store for money, they preferred taking of the miners instead something which they could either eat, drink, or wear, and not procurable at home. As they increased in numbers and means, merchants established themselves among them, thus enabling them to use their small stores of money in the purchase of needed supplies. Their great distance from market, and the small proportion of their crops which would bear transportation, have, however, at all times made money extremely scarce, and have led to the perpetration of a complicated and often amusing system of barter. Hundreds of farmers, living in reasonably comfortable circumstances, and having large families to clothe and educate, will not see a dollar in money for years. Such a farmer wishes to purchase a pair of shoes for his wife. He consults the shoemaker, who avers his willingness to furnish the same for one load of wood. He has no wood, but sells a calf for a quantity of *adobes*, the *adobes* for an order on the merchant payable in goods, and the order for a load of wood, and straightway the matron is shod. Seven water-melons purchase a ticket of admission to the theatre. He pays for the tuition of his children seventy-five cabbages per quarter. The dressmaker receives for her services four squashes per day. He settles his Church dues in eorghum molasses. Two loads of pumpkins pay his annual subscription to the newspaper. He buys a "Treatise on Celestial Marriage" for a load of gravel, and a bottle of soothing-syrup for the baby with a bushel of stragbeans. In this primitive method, until the advent of the Railroad, was nine-tenths of the business of the Territory conducted. And even now, in the more remote settlements, a majority of all transactions are of this character. The merchants, purchasing their goods in New York or San Francisco, must, of course, have money to pay for the same; but they sell their goods for cattle, flour, and dairy products, which are then marketed for cash in the adjoining mining Territories.

THE DIAMOND DRILL.—Severance, Holt & Co. have been making a new style of Diamond Pointed Steam Drill, at the Fulton Foundry, for tunnel or shaft drilling. The whole machine occupies a space only 24 inches long by 12 inches wide, and is attached to a post in such a manner that it can be slid up and down or turned, so as to drill in any required place and at any angle. Two men can handle it easily, and the machine is said to be capable of boring in any kind of rock at the average rate of one inch per minute. At the Foundry it drilled holes, one inch in diameter, a foot deep, in very hard, gritty sandstone; at the rate of 2½ inches per minute, with ease, the engine making 350, and the drill nearly 1000 revolutions per minute. This machine was made for the Blue Gravel M. Co., to be used in their tunnel at Smartsville. Messrs. S. & H. have machines at work in different parts of the State. They are taking the proper method of introducing their drill, by showing what it actually can do in practice, and have the finest prospects of success.

The San Diego Mines.

We have recently had the pleasure of a call from Mr. J. T. Dougine, who has been at San Diego for some time past, being connected with the milling interests. Mr. D. is an old hand at milling and has blown five pioneer whistles on the coast. He seems, as far as we can judge from our conversation with him, to be a very sensible sort of a person who has, during his years of practice, studied his profession, and certainly appears to know his business well. We have been furnished by him with several facts of interest concerning the district, which we give for the benefit of our readers.

To give a detailed description of the locality of the mines is now unnecessary after all which has been said. We will remark only that, according to the account given us, the mines are in a belt of slate and talc, about a mile wide, situated between granite walls which have a general direction of southeast and northwest. On this belt there is good deep soil, good wood and also pasture lands, but on either side the country is barren.

The most promising ledge, Mr. Dougine thinks, is one a little east of the centre of the belt, having the general southeast and northwest direction, on which are the San Diego, High Peak and Owens, and being very likely the same on which the Helvetia, a new and promising location, is situated. The mines have not been thoroughly prospected, however, as yet, and their true value cannot be said to have been really ascertained. Besides, the mining operations have been carried on, in many instances, in an unsystematic sort of way, which involves heavy expenses and small returns, and this has an especially bad effect, as there is so little capital in the camp. The matter of the Cuyamac grant has not been settled as yet, and this naturally has no favorable effect on mining.

The gold exists, as far as developments have gone, in a free state in the rock, there being no sulphurets present in any amount. The quality of the gold obtained is good, running from \$17.94 to \$18.45 per ounce. The amount of this metal in the various ledges varies very considerably. There is a large vein of quartz, 10 feet wide, which is quite barren as far as known, and others assay quite high. As assays are by no means so valuable as milling results, we are glad to be able to give the mill returns of a number of lots of ore. These are, of course, not given as the absolute values of rock in the different mines, for in the same mine very different results can be obtained. This is shown in one or two of the examples given. Yet mill results are very instructive and therefore we publish the following:

Mine.	Amount Treated.	Yield per Ton.
Lone Star.....	7 tons.....	\$7.00
".....	5 ".....	70.00
Shamrock.....	7 ".....	3.50
Eagle.....	10 ".....	2.90
".....	5 ".....	2.75
San Diego.....	19 ".....	35.50
".....	51 ".....	61.00
Owens.....	16 ".....	61.00
Keystone.....	4 ".....	7.00
High Peak.....	10 ".....	42.00
Sherman.....	4 ".....	4.12
Hannon.....	3 ".....	3.50
Pride of the West.....	13 ".....	31.00
White Fawn.....	3 ".....	0.37
North Star.....	5 ".....	4.50
North America.....	6 ".....	4.00
Monitor.....	5 ".....	4.00
Ella.....	3 ".....	1.25
Forty-Nine.....	12 ".....	12.50
Hayden.....	19 ".....	40.00

*The last came from a place where the vein widened out to a much greater width than usual. The first results are probably nearer the general average to be expected.

There are two mills in the district,—Cotton's, running 5 stamps, and the Wilson Steam Stamp Mill, 2 stamps, owned by J. McMechan.

Being naturally curious with regard to the Wilson mill, we enquired particularly as to its work. Mr. Dougine spoke of it in the highest terms. He has had charge of it, and has been running it from the middle of June to the present time, with, perhaps, a couple of weeks intermission in all, when there was no ore to be treated. Mr. D. has made a number of

experiments, with from 60 to 90 lbs. of steam and a varying number of drops, etc., but obtained the best results with 70 lbs of steam and 412 drops per minute (206 of each stamp). On August 10th, he crushed 10 tons 800 lbs. of Hayden rock in 8 hrs. 45 m., using one cord of wood (oak). On August 11th, 8,590 lbs. of the hardest rock obtainable were crushed in 5 hrs., with 65 lbs. steam. On August 12th, with 68 lbs. of steam, to crush 10,800 lbs. of ordinary rock, required 4 hrs. 50 m. In July, 51 tons were crushed in 47 hours. The average amount of ore which can easily be crushed in a day (of 24 hours) is 28 tons, with a No. 6 slot screen, and using not over three cords of 4-foot wood; the average consumption of fuel is one cord to 10 tons of ore.

The durability of the mill is very great, no breakage having occurred and there being no signs at all of any probability of breakage. In every part the mill has worked wonderfully well. It took just six days to set up the machine ready for work. It is so simple, durable and economical, and so efficient, that Mr. D. has thought it worth while to get the certificates of the employees, amalgamator, rock-breaker and battery feeder to all the facts which he states, in order that there may be no doubt on these points.

Taking these points into consideration, and not forgetting its comparatively very low cost, it would seem that the mill must be pronounced a great success. It is thought that, at San Diego, \$6-ore can be mined and milled at a profit, where this mill is used and the same party owns both mine and mill. It would appear then that, with proper management, San Diego might add very essentially to the bullion production. It may be stated in conclusion that, at present, 4-foot oak costs there \$3 per cord, and that for custom work, the mill rates are: for sample lots, \$10 per ton; for 50-ton lots, \$7; for 100 tons and upwards, \$6 per ton. We should also state, in connection with the above figures, that the same boiler runs two steam pumps, one for feeding the boiler, and one for pumping back the water from the settling tank, this last being necessary on account of the rather scanty supply of that article.

COLORADO GEOLOGY.—The scientific party, under Prof. Marsh, were reported last week at Cheyenne. They are said to have found an extensive tertiary deposit in northern Colorado identical with the "Bad Lands" deposit of Dakota.

TO PACIFIC COAST INVENTORS.

DEWEY & CO.
San Francisco.
Scientific Press
U. S. & Foreign
PATENT AGENCY.

Expense of Applying for Patent.

The Government fee, on filing an application for a patent in the United States, is fifteen dollars; and if the patent is allowed, twenty dollars additional is required. If rejected, the first fee of fifteen dollars is all that is demanded.

To the foregoing official fees must be added fees for preparing the various documents and expense of drawings. Our charge for preparing the documents for a case, presenting it to the Government, and attending to all business connected with it, is \$25 and upward. For cases demanding extra work and attention, only a reasonable fee in accordance with the services required, to do full justice to the case, will be charged.

Following is the list of Government fees, payable in currency:

On every caveat.....	\$10
On every application for a patent, for seventeen years.....	15
On every application for a design, for 3 yrs and 6 mos.....	10
On every application for a design, for seven years.....	15
On every application for a design, for fourteen years.....	20
On issuing each original patent.....	20
On every application for a re-issue.....	10
On every additional patent granted on a re-issue.....	30
On every application for an extension.....	50
On the grant of every extension.....	50
On appeal to the Examiners-in-Chief.....	10
On appeal to the Commissioner from Examiners-in-Chief.....	20
On every appeal to the Judges of Circuit Court, D. C.....	25

Inventors on the Pacific Coast, located at great distance from the Patent Office, of all others, should be careful to avoid inexperienced, dishonest, or otherwise unreliable and irresponsible agents.

Inventors having models in our possession must send written orders when they desire any particular friend to see them.

Self-Evident Facts.

Having had large experience, and gratifying success with the great variety of cases emanating on this coast, we feel confident of our abilities to assist inventors in patenting their inventions, saving them from vexatious delays, and from receiving worthless papers by reason of imperfect preparation of their claims before being sent to the Patent Office.

In early days but little preparation was needed, or but ordinary skill required to obtain a patent; but now, by reason of the multiplicity of inventions, and the numerous Acts of Congress, found necessary to protect the inventor while the patent lasts, and to do justice to the people after it expires, the utmost care and skill are requisite in managing cases and obtaining a patent that will be of real value to the Patentee, and stand the test of passing through the legal ordeal of an infringement suit.

The general practice of the Patent Office regarding the examination or issue of Letters Patent for inventions has not been materially changed for many years, yet there have been amendments added to the laws of 1861, 1863, and 1866, and which it is necessary for all parties managing an application to be conversant with. Old inventors invariably advise the employment of none but agents of responsibility and experience. As agents with such qualifications, we solicit honest patronage.

Dangers of Delay.

Situated so remote from the seat of Government, delays are even more dangerous to the inventors of the Pacific coast than to applicants in the Eastern States. Valuable patents may be lost by the extra time consumed in transmitting specifications from Eastern agencies back to this coast for the signature of the inventor, or by reason of return for amendment when addressed directly by the inventor to the Government.

Saving of Time.

In urgent cases for an immediate patent, persons can deposit the amount of the last fees with us, in San Francisco, and have our Washington agent procure the issue of the papers as soon as granted, saving at least several weeks time which would otherwise be required for the inventor to receive notice and then forward the money. Money advanced for this purpose will be returned, should the application be rejected. By adopting this course, we are enabled, with our other advantages, to secure the receipt of patent papers to inventors on this Coast several months sooner than can generally be done, through agents in the East,—without the applicant going to the risk and expense of sending on the last fee before it is known whether the patent will be granted.

By Telegraph.

In cases of immediate importance we can have their progress reported by telegraph, so that applicants know immediately the result of the examination and decision of the Patent Office. We also make examinations by telegraph regarding the patentability of inventions; examine patent assignments on record at Washington; obtain copies of patents or claims, and also derive other information desired instantly from the Patent Office.

DEWEY & CO.,

Publishers Mining and Scientific Press, U. S. and Foreign Patent Agents, 514 Clay street.

THE SCIENTIFIC PRESS is a valuable journal for all persons engaged in matters connected with practical industry where science or machinery are needed.—*Colorado Herald*.

Farming and Gardening.

COMMUNICATIONS for this department are solicited from all parts of the Pacific States and Territories.

Cultivation of Hops.

Few persons are aware of the importance to which this branch of agriculture might be carried in this State, by a judicious system of cultivation, curing and shipping. Our home market is already well supplied, and the introduction of California hops, in large quantities, at the East and in Europe is perfectly practicable.

The demand of this product is rapidly increasing in the United States. The crop of 1840 was but 620 tons; in 1850 it had increased to 2,223 tons; in 1860 it was 5,500, while the last year's crops was estimated at the very large amount of 12,000 tons. About one half of the total amount is produced in the State of New York, and one third in Wisconsin. Large quantities of American hops are exported to England, where the consumption is enormous, aggregating fully 20,000 tons, with but very little home production, owing to the unsuitableness of the climate.

Notwithstanding some little feeling of opposition or prejudice was at first encountered in the introduction of California hops in New York and in Europe, those unfavorable impressions are fast giving way before the experience of their actual use; and it is now quite generally conceded that no country in the world produces larger, finer or stronger hops, than California. Thousands of bales have already found their way to New York, and some small shipments to Europe.

Some of the brewers assert that while California hops are strong, they lack a peculiar flavor, which always pertains to the Eastern hops. Others maintain that they contain an excess of a bitter principle, foreign to that due to the legitimate bitter of the lupine. Some experts who admit these objections to a greater or less extent, yet hold that it is due to their being produced on new ground, and that, in successive years of cultivation they will gradually lose this peculiarity, others hold that this objection is a mere fancy or prejudice. It has also been claimed that a long sea voyage seriously interferes with the aroma of the hop. If such is the case, railroad transit would remove such objection.

According to the report of the New Hampshire State Ag. Society, the cost of raising hops in that State does not exceed five cents per pound; while the ordinary market price is from 12 to 15 cents sometimes going up to 30 and 40, and in very exceptional cases to 60 cents per pound. The cost of their production ought to be less in this State than elsewhere, on account of their more abundant yield, and the fact that all the tending, picking, curing and baling can be done with the cheapest kind of labor—cheaper than that attainable at the East. While California hops sell in this market for 8, 12 or 15 cents, according to the season or market, they are at the same time worth from 20 to 30 cents, and sometimes more, in London. These figures, at the present low rates of freight over the Pacific Railroad, ought to afford a handsome margin for profit over the highest price here and lowest there. Hops are now worth about 30 cents in London.

Prospects of the Present Season.

As we have already intimated, there are great fluctuations in the prices of hops. They have varied within a few years from 12 to 60 cents per pound. At 12 cents, even, the grower ought to find a fair margin for profit; which one good year would largely remunerate. This season the crop is likely to be a failure both at the East, and in Europe, while it never promised better in this State. In fact the uniformity of the California season, and particularly the immunity from excessive moisture during the summer, renders the hop crop more sure here than perhaps in any other part of the world.

The prospect of high prices at the East, will be cheering news to California growers, who have had several successive years of low prices. Letters from all the hop districts, both in the Eastern and Western States agree that the crop will be an excessively short one this year. Owing to previous failures many have plowed up their hop fields, and planted other crops. The various insects which prey upon this plant have been wonderfully active almost everywhere; while a generally unfavorable condition of weather is reported.

Emmett Wells, than whom there is no better authority, in his last hop circular gives extracts from a large number of his correspondents in various parts of the Union, from which we collect as follows:—In Richfield Springs, N. Y. the crop looks very poor; growers set the crop at only about one half that of last year; 500 lbs. to the acre is the highest estimate. In Oneida County not over one quarter of a crop will be realized; the lice and honey dew are working much injury. Similar reports come from Stockbridge and the Chenango Valley. An unprecedented drouth is adding its damage to that of the insect enemies. To the business interest of this vicinity says one correspondent, this is a calamity which will drive many out of the business altogether. The circular closes as follows:—"Our advices from Wisconsin are of the same tenor—if anything still more discouraging!"

When we add to the above now well established fact that the crop will be almost as short in Europe as in the Eastern States, our California growers may well take heart. Special care should be taken in curing and packing, so as to secure a choice article for export, and establish such a reputation for California hops abroad, as will secure for them a fair market hereafter, when they come in contact with better crops and lower prices in those markets.

Reclamation of Tule Lands.

The work of reclaiming the tule lands on the islands in the Sacramento and San Joaquin rivers is progressing rapidly, and most satisfactorily. This land, which comprises millions of acres, in its unreclaimed state is utterly unproductive and worthless, but when reclaimed it makes the best land in the state, and is suited to every class of cultivation. It has proved excellent for either wheat or roots, and will no doubt be found well adapted and of great value for the cultivation of rice. The islands upon which work is now in progress, are enumerated in the *Alta* as follows:

Sherman.....	14,000 acres,
Twitchell.....	3,000 "
Andross.....	4,000 "
Tyler.....	10,000 "
Staten.....	8,000 "
Bouldin.....	7,000 "
Roberts.....	90,000 "
Union.....	50,000 "
Grizzly.....	12,000 "
Total.....	198,000

On some of these tracts, work has been commenced with insufficient means, and without any comprehensive plan, which will defer any productive results for some considerable length of time; but the great bulk of the land mentioned is in energetic hands, by whom the work of reclamation will be pushed forward as speedily as possible. The amount reclaimed will increase rapidly from year to year, as will also new undertakings. The most of the land, as soon as reclaimed, will be put in the market for sale, in small tracts; thus ensuring for it an early and thorough development and productive value.

In addition to the above, arrangements are being made for the early reclamation of Grand Island, comprising 17,260 acres. Advertisements have also been published preparatory to the reclamation of a tract of about 100,000 acres, on the west bank of the Sacramento, between Knight's Landing and Colusi.

The tules of California will soon occupy a very important place in the agriculture of the state, and will undoubtedly eventually prove the most valuable farming lands on the Pacific coast. This latter result cannot fail of being realized, as soon as they can be thoroughly reclaimed and put in cultivation. Their fertility will be more lasting than our valley lands, while their location, directly upon the lines of our great natural high ways, will give a great advantage in the transportation of their products to market.

Large Profit from Planting Forest Trees.

One great reason why people are so disinclined to plant forest trees may be found in the mistaken idea that they will have to wait an ordinary life time to derive any profit therefrom. Now, nothing can be further from the truth. Any farmer owning ground convenient to any of the railroad or water communications with this city, or with any of the other principal cities in this State, might, in twelve years, derive more than double the profit from planting one-fifth of his land with forest trees, that could be realized from the same land devoted to any other ordinary field culture, to say nothing of the less amount of labor required for the former.

Let us make a few figures, and see if this is not so. An acre of land planted with locust trees or any other tree of rapid growth will, in twelve years, give the farmer about 2,000 trees, 30 feet high and from 12 to 14 inches in diameter. These trees will furnish, at least, 2,000 railroad ties and the same number of fence posts, which, by reason of the superior quality of the wood, will command the highest price and a ready sale. There would then be left about 70 cords of fire-wood, worth \$5 per cord. This timber and fuel would be worth \$1,000, or \$83 per acre per year, as the product of the land. If it was allowed to stand five, ten or fifteen years longer the annual average value would be largely increased, without any deduction whatever for labor. We have calculated on a close cultivation, for the reason that a straighter and taller growth is thereby obtained. Very likely a close planting, say by one-third or one-half even, would come forward equally as well, until it had attained the growth proposed, in which case a proportionate addition would be made to the profit, without any material increase in labor or expense.

These figures are made for obtaining early returns and closing out the speculation. We will now give a few figures, intended more for a permanent investment. Let us adopt two different varieties of timber, say the European larch and the common white pine, and prepare for a model timber farm, something on the European plan. We say, at least, two kinds, for, in doing Nature's work, we must imitate her manner of doing it. Nature always introduces variety into her vegetable products, whether it be trees, shrubbery, flowers, weeds or grass. Man does violence to nature when he compels the soil to produce but one growth for any length of time. Probably three or four different varieties would be better than the two we have named.

First let us examine a few facts. Both these trees are very reliable for timber, and have succeeded well in forest culture. The former, in the middle Atlantic states, is found to attain a height of from 30 to 35 feet, with a diameter of 8 to 12 inches, in ten or twelve years; while in from forty-five to fifty it reaches a height of 100 feet and over, with a diameter of about three feet.

The larch is especially a European tree, where it is largely cultivated there in forest growth. Experience and observation show that it will attain a height of 30 feet in 12 years, with a diameter of 10 to 12 inches; while in 20 years it will reach 50 feet in height, and a diameter of at least 20 inches. The longer and more favorable season for growth in California, judging from our experience in the growth of fruit, and to some extent in forest trees, will add largely to the above growth. With this information let us proceed to put out our timber farm.

How to Prepare and Plant the Ground

In Europe the tree is usually started in a nursery, and placed in the field at the end of the first year's growth. Many, especially in this country, prefer to plant

this seed where the tree is to grow. The ground which may be a light and indifferent soil, either hill or plain, should be prepared as for corn or wheat, and marked off by the plow into rows three feet apart, crossing at right angles. This will give, say 4,900 crossings to an acre, at each one of which a tree should be set or seeds planted. One variety only may be planted or different kinds as desired. We will suppose two kinds are taken—the pine and larch already referred to, with the view of eventually closing out with a pine forest exclusively of large growth. We would take the locust in preference to the larch, if it were not for the fact that we desire, according to this plan, at the end of a certain time to remove all but the pine. This removal would be impracticable with the locust on account of its impressive disposition to send up sprouts when cut down or dug up.

Set every fourth tree each way, a pine, and the balance with larch. This would give say, 300 pine and 4,600 larch. The ground should be kept clear of weeds for the three first years, after which it will protect itself. Close cultivation is an advantage at the start, in order to secure shade for the ground.

At the end of the fifth or sixth year, remove every alternate larch. Those reserved, 2,300 in number, may be left for fuel, grapevine stakes, or hop or bean poles. Many of the trees will be long enough for light fencing stuff. The timber so removed will leave quite a large value per acre, over and above the cost of removal; moreover, its presence up to this time is necessary to secure the better growth of the entire forest. At the end of the next five or six years, again remove each alternate larch as before. The trees now removed will be at least 30 feet high, by 12 to 14 inches in diameter, and will number 1,150. The butt of each tree will make a good railroad tie, and an average of two fence posts in addition, may be obtained—say 2,300 in all, while the balance of the wood can be worked up into poles or fuel. The value of the timber so removed may be easily calculated, remembering, that in this country, railroad ties and fence posts will always be in demand, as well as fuel, and at large prices.

At the end of the next 5 or 6 years, again take away each alternate larch, or 573 trees, which will now be about 18 inches in diameter, and 45 to 50 feet high, still more valuable for railroad ties and fence posts, and even for small spars. The trees removed will be worth from \$3 to \$4 each.

At the end of the fourth period, say 20 to 24 years, remove the balance of the larch trees—575 in number—and leave the forest proper, 300 trees of pine only, standing about 12 ft apart. The trees now removed will be from 20 to 24 inches in diameter, and from 50 to 60 feet high, of sufficient size to furnish for the saw mill, two cuts aggregating 500 feet, from each tree. The lumber which may be thus produced, is equal to the best clear pine or hard oak.

We may here remark, that the European (not the American) larch is one of the most valuable trees for lumber which can be grown. It is a very close grained wood, of reddish or gray color, remarkable for weight, strength, beauty and durability. It is better for ship timber than the oak, and will last as long in the ground or in the water as our California redwood. This subject will be concluded next week.

THE ORANGE AND LEMON ON THE COAST RANGE—The San Jose *Mercury* suggests that fruit growers about Lexington, and those in other sections of the mountains surrounding the Santa Clara Valley, should try the orange and lemon, in preference to any further extension of the fruit now cultivated there, and which cannot be made profitable on account of its abundance and distance from a market. The hills or mountain slopes are suggested for such cultivation, rather than the plains at their foot, for the reason that they are more free from frosts. The *Mercury* says: It is somewhat remarkable that in the hills on either side of this valley, after reaching an altitude of from 300 to 500 feet above the plain, the frosts are scarcely ever severe enough to injure the tenderest plants. It frequently happens that no frosts at all are experienced, throughout the entire winter, in the neighboring hills, above the altitude mentioned, and that potatoe and tomato vines will grow all winter.

SHALL WHEAT STRAW BE BURNED.—John Wragg, of Waukege, Iowa, writes to the Farmer's Club at New York, asking if it would be best to burn wheat straw, plow it under or compost it. Mr. Ely, of the Club answers—"A lazy man would say burn it; a better farmer would say plow it under." Dr. Trimble replied—"A good farmer never burns his straw."

This is a question which has an important bearing in California. On new, rich land the straw may not be needed immediately, but it will pay to keep it, pitch it over and compost with sufficient soil to rot it during the rainy season. It will in time be worth much more than it has cost to keep it. It will future years become a bank upon which you may draw without being dishonored. "Plowing under," in such a dry climate as California, before the straw has become decomposed, will do but little good. Judgment must be used in nearly all farming operations, to the end that action may be properly conformed to circumstances. "Brains, sir, brains are what are wanting." Brains have increased the yield of the English wheat from 15 to 35 bushels to the acre; while the lack of them, or rather the lack of their use, has decreased the yield of some of our fields, from 30 to less than 10 bushels.

CROPS IN MONTANA, A FESTIVAL FAIR.—Our Montana Exchanges are congratulating their readers on the fine and plentiful harvests in that country. Wheat is good, and they have a sufficient number of good and efficient mills to turn out all the flour needed. The hay harvest is also pronounced abundant, and it is being gathered and put up in good condition. Similar reports are made with regard to vegetables, many of the ranchmen there are getting rich, or at least independent. A call is made for an Industrial Fair, for that country, which will be kept up annually, and which shall—as may be done—exhibit to the world, in a more creditable manner, their great agricultural, mechanical and mineral resources. There was an exhibition of the kind held there, two years ago; but it is claimed that the times now are much more propitious for such an exhibition.

THE STRAWBERRY CROP.—The San Jose Independent gives the following facts, with regard to the yield of some of the most extensive strawberry fields in Santa Clara County:—Mr. L. A. Gould owns 35 acres, on which are planted 350,000 vines; the yield last year was 50 tons, and his cash sales amounted to \$10,323. Benjamin F. Hayden cultivated 12 acres with 100,000 vines, which, at the above average produced 20 tons, which, at ten cents per pound, brought him 4,000. Minor King, 1½ acres on 12,000 vines, \$240. Benjamin F. Watkins, 6 acres, 60,000 vines, 7½ tons \$500. Cary Peebles, 5 acres, with 45,000 vines, 3½ tons, \$700. Edward Burrill, 5 acres, 50,000 vines, 5 tons, \$1,000. William Hannibal, 3 acres, 30,000 vines, 3 tons, \$600. Isaiah Wilcox, 11 acres, 110,000 vines, 11 tons, \$2,200. Wm. Lawrence, 6 60,000 vines, 7½ tons, \$1,500. George Brown, 20 acres, 200,000 vines, 20 tons, \$4,000. Mr. Jamison, 16 acres, 160,000 vines, 16 tons, \$3,200. F. A. Pancoast, 32 acres, 320,000 vines, \$6,325. Total, acres, 152½. Total vines, 1,525,009. Total value of yield last year, \$35,598. Average yield to the acre, \$234.

A LONDON COMPLIMENT.—The London Mining Journal, a high authority in the old world in its line, gives its readers a liberal notice of Mr. Kustel's new work, "Roasting of Gold and Silver Ores and Extraction of their Respective Metals without Quicksilver," recently published at the office of the SCIENTIFIC PRESS. It correctly remarks: "As Mr. Kustel gives plane and sections of the several furnaces, and carefully explains the advantages and defects of each, the practical man can readily ascertain which particular form is best suited to his immediate purpose."

STILL DIVIDING UP.—About 4,000 acres of the Coyote ranch in Lake county, have lately been sold out in small tracts to settlers.

Farmers' Banks.

Why do we not have farmers' banks in this state. Our farmers are often compelled to raise money by selling portions of their grain to speculators at ruinous rates. Such banks, judiciously located in the interior, under proper management, and loaning only on farm mortgages or warehouse receipts for grain, would do much good, and greatly aid in the agricultural development of the state. The *Colusi Sun* endorses such a course as follows;

The farmers cannot ship on their own account—that would be attended with too many complications, but they can establish Farmers' Savings Banks in every agricultural county in the State. If the farmers who have plenty of money buried or locked up, doing them no good, would only put it in such a bank and establish a low rate of interest, the farming community would be so relieved that no one would be obliged to sell. The investment could be made perfectly safe, for the farmer can always give security.

We have a mixed institution of the kind in this city—the Farmers' and Mechanics' Bank—which is doing much good in this direction; but this is local and necessarily limited in its work and means. Two or three banks have been established in the interior, on a similar plan to the one named, all of which, we believe, are doing well. Why cannot we have in addition, a few special farmers' banks in the state. There is no business in the world which offers better security, or that is less inclined to run into speculations. All the trades organize for their mutual benefit—why not the farmers? In organization there is strength, and with it the farmers can save for their own pockets much of the large profits which the speculators, under the present system, are making out of their necessities. The *Sun* suggests that this matter should be taken up by the farmers at the approaching State Fair. We would add that it be considered at each of the District and County Fairs. We ought to have such a bank at the county seat of every farming county. Without some such course our farmers will ever continue to labor for the benefit of grain speculators and country merchants.

Rice Growing in California.

We have made several allusions to the experiment now in progress by Mr. Hugh Davis, on Andros Island, to test the practicability of growing rice on the tule lands of this state. The experiment is one of great importance to the state, and should be watched with much interest. Of course we shall not fail to report progress. Mr. Davis has planted two acres—one on tule cultivated last season, and the other on tule planted for the first time for this experiment. That which had been previously cultivated has much the advantage, from the fact that by such cultivation, the tules have been effectually killed, leaving an undisturbed growth for the rice; while the rice grown on the latter is greatly interfered with and choked down by the sprouting tules. The *Alta* gives the following as the *modus operandi* of Mr. Davis' cultivation:—

Mr. Davis lets the water stand about a week at a time in his field, opening his gates at every high tide, and then keeps out the water for three days and thus alternates from wet to dry. The rice field is surrounded by a dyke which, in the opinion of Capt. W. C. Walker, who has had considerable experience in tule, should be erected over a ditch dug down to low water mark, and then filled up with the same earth rammed down. If this ditch is not dug, the water will not be held by the dyke, but will run out and give bother in other fields.

IRRIGATION AND DRAINAGE.—The man who will invent cheap irrigation, will be one of the main benefactors of the race. The man who will convince farmers of the full benefit of drainage, will be another.

What I Know of Farming—No. 34.

Intellect in Agriculture.

If a man whose capital consists of the clothes on his back, \$5 in his pocket, and an ax over his right shoulder, undertakes to hew for himself a farm out of the primitive forest, he must of course devote some years to rugged manual labor, or he will fail of success. It is indeed possible that he should find others, even on the rude outposts of civilization, who will hire him to teach school, or serve as county clerk, or survey lands, or do something else of like nature; thus enabling him to do his chopping trees, and rolling logs, and breaking up his stumpy acres, by proxy; but the fair presumption is that he will have to chop and log, and hew off and fence, and break up, by the use of his own proper muscle, and he must be energetic and frugal, as well as fortunate, if he gets a comfortable house over his head, with forty arable acres about him, at the end of fifteen years' hard work. If he has brains, and has been well educated, he may possibly shorten this ordeal to ten years; but, should he begin by fancying hard work beneath him, or his abilities too great to be squandered in bushwhacking, he is very likely to come out at the little end of the horn, and, struggling back to some popular settlement, more needy and seedy than when he set forth to wrest a farm from the wilderness, declare the pioneer's life one of such dreary, hopeless privation that no one who can read or cypher ought ever to attempt it.

A poor man, who undertakes to live by his wit on a farm that he has bought on credit, is not likely to achieve a brilliant success; but the farmer whose hand and brain work in concert will never find nor fancy his intellect or his education too good for his calling. He may very often discover that he wasted months of his school days in what was ill-adapted to his needs, and of little use in fighting the actual battle of life; but he will at the same time have ample reason to lament the meagerness and the deficiency of his knowledge.

I hold our average Common Schools defective, in that they fail to teach Geology and Chemistry, practical knowledge of things—knowledge which the farmer, of all men, can least afford to miss. However it may be with others, he virtually needs to understand the character and constitution of the soil he must cultivate, the elements of which it is composed, and the laws which govern their relations to each other. Instruct him in the higher mathematics if you will, in logic, in meteorology, in ever so many languages, but not till he shall have been thoroughly grounded in the sciences which unlock for him the secrets of Nature; for these are intimately related to all he must do, and devise, and direct, throughout the whole course of his active career. Whatever he may learn or dispense with, a knowledge of these sciences is among the most urgent of his life-long needs.

Hence, I would suggest that a simple, lucid, lively, accurate digest of the leading principles and facts in Geology and Chemistry, and their application to the practical management of a farm, ought to constitute the Reader of the highest class in every Common School, especially in rural districts. Leave out details and receipts, with directions when to plant or sow, etc.; for these must vary with climates, circumstances, and the progress of knowledge; but let the body and the bones, so to speak, of a primary agricultural education be taught in every school, in such terms and with such clearness as to commend them to the understanding of every pupil. I never yet visited a school in which something was not taught which might be omitted or postponed in favor of this.

Out of school and after school, let the young farmer delight in literature illustrative of his calling—I mean the very best of it. Let him have few agricultural books; but let these treat of principles and laws rather than of methods and applications. Let him learn from these how to ascertain by experiment what are the actual and pressing needs of his soil, and he will readily determine by reflection and inquiry how those needs may be most readily and cheaply satisfied.

All the books in the world never of themselves made one good farmer; but, on the other hand, no man in this age can be a thoroughly good farmer without the knowledge which is more easily and rapidly acquired from books than otherwise. Books are no substitute for open-eyed observation and practical experience; but they enable one familiar with their contents to observe with an accuracy, and ex-

periment with an intelligence, that is unattainable without them. The very farmer who tells you that he never opened a book which treats of Agriculture, and never wants to see one, will ask his neighbor how to grow or cure tobacco, or hops, or sorgho, or any crop with which he is yet unacquainted, when the chances are a hundred to one that this particular neighbor cannot advise him so well as the volume which embodies the experience of a thousand cultivators of this very plant instead of barely one. A good book treating practically of Agriculture, or of some department therein, is simply a compendium of the experience of past ages combined with such knowledge as the present generation have been enabled to add thereto. It may be faulty or defective on some points; it is not to be blindly confided in, nor slavishly followed—it is to be mastered, discussed, criticised, and followed so far as its teachings coincide with the dictates of science, experience, and common sense. Its true office is suggestion; the good farmer will lean upon and trust it as an oracle only where his own proper knowledge proves entirely deficient.

By-and-by, it will be generally realized that few men live or have lived who cannot find scope and profitable employment for all their intellect on a two hundred acre farm. And then the farmer will select the brightest of his sons to follow him in the management and cultivation of the paternal acres, leaving those of inferior capacity to seek fortune in pursuits for which a limited and special capacity will serve, if not suffice. And then we shall have an Agriculture worthy of our country and the age.—*Horace Greeley.*

FIRES IN THE FIELDS.—Although such fires have been less extensive and general the past, than during previous seasons, still much damage has been inflicted in that way. Choppers, hunters and railroad locomotives have caused about their average amount of destruction. All such should be exceedingly careful, as the penalties of the law are very severe for starting such fires, no matter whether the fire is started by accident or design.

FRUIT, though abundant, is small, and much will be allowed to rot, on the ground, while we still continue to import large quantities of dried fruit. We ought to be able to export dried fruit of almost every description. Farmers and householders generally ought also to make their own vinegar. The smallness of fruit this season is mainly due to the excessive heat and dryness of the atmosphere. The moisture has been taken away from the fruit and leaves more rapidly than the roots could appropriate it from the parched soil. Although the trees are generally as full as usual, the diminished size will greatly reduce the bulk and weight. Grapes have been affected as much as other fruit.

The Pomological and Horticultural Fair.

This Exhibition was opened, according to announcement, at 3 o'clock, P. M. on Monday, at the Pavilion of the Mechanics' Institute. The inaugural address by Prof. Carr, of the University of California, was appropriate, to the point, and replete with good things. After the conclusion of the address, the Fair was duly declared "open," by Mr. Hallidie, President of the Mechanics' Institute, under the auspices of which association this exhibition has been given. The interior of the Pavilion has been beautifully decorated for the occasion, and the display of plants, fruits, flowers, etc., is good—but far short of what it would have been if proper time had been allowed. It is still, however, very fine; nothing like it has ever before been seen on this coast, and taken as a whole, no where else on the continent.

The fruit tables are well covered and with a great variety of fruit. Around the fountain, from the centre of which towers the lofty and magnificent century plant, a description and figure of which is given elsewhere, is an exquisite display of flowers, varied in their species and beautiful to the sight. On the right and left, tastefully arranged, are the contributions of the different horticultural exhibitors. We have now merely time and space for the following brief mention of the principal

Exhibitors and Exhibits

That were in view on Thursday morning. Numerous additions have since been made, some or all of which will be noticed next week, together with more full mention of the more prominent exhibits.

Orleans Hill Agricultural Association.—Three bottles of white wine, 1869; two bottles of Orleans wine, 1867; two bottles of Orleans, 1868; two bottles Rieslings, 1866; two bottles Rieslings, 1869; one bottle port, 1869; one bottle tokay, 1869.

E. A. Upham, non-professional grower—Collection of plants and flowers.

H. D. Dunn & Co.—Forty-eight bottles wine; vintage of 1867 and 1868.

J. Levelling & Son.—Four boxes and one basket fruit, one chest grapes.

D. B. Wilson.—One box oranges.

Allen & Co.—One hundred plants in pots and hanging baskets.

Mr. Rheimer.—Eleven hundred plants and cut flowers in pots and boxes.

California Silk Culture Company, William Blauding, President.—One case raw silk, one bunch

of cocoons, one bundle of reeled silk, card of eggs.

Wm. Hunt.—One bottle of oats, three bunches of Black Hamburg grapes.

B. F. Headen, Santa Clara.—Eighty plates of fruit, ten bottles unfermented grape juice, two bottles white wine.

R. B. Woodward.—One hundred and twenty-three plants in pots, two boxes fruit.

A. Lusk & Co.—Three boxes oranges, one box of quinces, one basket of peaches.

P. D. Code & Co.—Forty-eight and a half canned fruit, ten bottles jelly, twenty-four tumblers of jelly.

A. Kenyon, Obispo, Solano county.—One basket of pears and apples.

E. Andrews, Sonoma.—Three boxes pears.

Mr. Kimball.—One watermelon, three seed potatoes, two stalks green corn, one stalk cotton.

R. Stone.—One bottle of wheat.

Grass Bro's., Marysville.—Four boxes apples, pears, grapes and plums.

W. Meyer, Union Nursery.—Collection of plants in pots, cut flowers in baskets.

A. Caldwell, Petaluma.—Two boxes plums and apples.

E. & P. J. Cassin.—Four dozen XXX Bitters.

Eberhardt & Lachman.—186 bottles Champagne brandies, bitters and wine.

Miss Crittenden.—One vase of wax flowers and autumn leaves.

W. Anderson.—One potato, raised by William Poole, Sacramento, 11½ inches long, 1½ in circumference, and weighing 3 pounds 9 ounces.

C. Phelps, Walnut Grove.—One potato, dug August 1869; 18 inches long, 14 inches in circumference, weighing 3 pounds 16 ounces.

M. Keller.—176 bottles wines, brandies and bitters; one box lemons.

A. Gore.—One bag white bald Mediterranean wheat; yield, 17 bushels to the acre; grown near Stockton.

W. F. Swasey.—Two cases of California Bon-Zest—relish.

J. H. Purdy.—Two bottles of syrup, one package of sugar; grown and manufactured in Monterey county.

E. Moore.—Plants in pots, cut flowers, hanging baskets, box of pansies, box of verbenas.

W. F. Kelsey.—149 plants in pots.

Thomas Appleby.—Eighty-three plants in pots.

Mr. O'Hare.—147 plants in pots.

F. Schleifer.—Three kegs California brandies and three bottles brandy.

J. S. Finch.—One ramie plant and sample of ramie—California grown.

United Anaheim Wine-Growers' Association.—Six dozen bottles juice and brandy—California manufacture.

Lake Vineyard Wine Company.—Four dozen California wine, half a dozen Angelica wine.

San Francisco Produce Exchange.—One sample containing cereals.

O. W. Craig.—One lot native sherry, one lot native muscatel, one lot native amber malaga.

S. W. Shaw.—One lot native dry muscatel.

J. R. Snyder.—Lot El Cerito white wine, lot El Cerito red wine.

Bowen Brothers.—Lot dry peaches, lot mountain dew honey, popcorn.

J. R. Wheeler.—Two bottles wheat grown in Oregon.

W. M. Boyd & Co.—Lot of California yeast powder.

W. O. Hawkins.—Seven dozen U. S. A. Indian root bitters.

F. A. Miller.—Design for California landscape gardening.

W. J. Lavery & Co.—Eight boxes of starch, twelve sample packages, two boxes of yeast powder.

Landsberger.—Eight cases wines and champagne.

L. J. Rose.—Three bottles American wine.

E. Allen.—Three bottles of white wine, three bottles of red wine.

D. McCord, Napa Valley.—One box of grapes.

Isaac Bird, San Jose.—One lot of grapes.

H. Epstein & Co., Nine dozen of IXL Bitters.

D. L. Perkins, Sherman Island.—One hundred and thirty-eight varieties of seeds in bottles, four watermelons, two potatoes, one beet, one squash, one ear sweet corn, one sample of flax.

George West, Stockton.—Two bottles port wine of 1865, two bottles port of 1866, two bottles of sherry of 1866, two bottles of sherry of 1867, two bottles of white Frontignan 1867, two bottles white Frontignan 1868.

Jos. Putzer, Santa Clara.—One package Hungarian rye, yield 74 bushels to the acre.

C. H. Dennison.—Section of a tree from the petrified forest of Calistoga.

J. Hutchinson, Bay Nursery, Oakland.—Collection of cut flowers and plants, in pots and hanging vines.

J. M. Patterson.—Collection of plums, pears, apples, pears and blackberries.

W. A. Field.—Three acacia trees.

Dr. J. B. Trask (non-professional).—One Florida palmetto.

Tyler Curtis.—Five plants in pots, four plants in boxes, viz: Four Japau lilies, one orange tree, one daphnia, one pinus from Japan.

S. Wing, Napa.—Five bottles wine, four boxes pears and grapes.

R. S. Thompson, Napa.—Thirty varieties of grapes, six varieties of apples, three varieties of pears.

General W. S. Jacks, Napa.—Collection of native trees, in pots.

ALTA sheet of 1851, printed on California silk.

H. D. Dunn & Co.—Six bottles of Angelica wine.

B. N. Bugby.—Seven cases of wines,

two cases of champagne, one case of brandy.

B. S. Fox.—Eight cases of apples, pears, plums and prunes.

L. A. Gould, Santa Clara.—Three boxes and one basket of pears, apples, prunes, grapes, peaches, walnuts and almonds.

H. Brighton.—Two boxes grapes from Green Valley.

Thomas A. Garey, Los Angeles.—Samples of silk cocoons.

Nash & Co. Napa.—Three water melons, two squashes, two jars gooseberries and pears, six stalks of corn.

Bavena & Co.—One case of macaroni and vermicelli.

A. H. Todd.—Sample of corn planted May 10th, and grown without irrigation, on the farm of J. W. Bulwer, Mayfield.

Premium Awards—Fruits.

The following awards have been given for the best exhibitions of fruit:

J. Luelling & Son, for best general display of Fruits; Diploma.

H. F. Hutchinson, best specimens of Peaches (5 or more); \$10.

B. S. Fox, best exhibit of Apples (30 varieties or less); \$40.

B. F. Headen, second best exhibit of Apples (30 varieties or less); \$20.

R. B. Woodward, best specimens of Apples (10 varieties or more); \$10.

S. P. Smith, best exhibit of Pears (25 varieties or less); \$40.

B. E. Fox, second best exhibit of Pears (25 varieties or less); \$40.

H. F. Hutchinson, best specimens of Pears (10 varieties or more); \$10.

B. S. Fox, best exhibit of Plums (15 varieties or less); \$25.

L. A. Gould, second best exhibit of Plums (15 varieties or less); \$20.

H. F. Hutchinson, best exhibit of Foreign Grapes; \$50.

S. Wing, second best exhibit of Foreign Grapes; \$20.

West, third best exhibit of Foreign Grapes; \$10, with a recommendation for special Premium for finest specimens of Grapes.

R. S. Thompson, best exhibit of Mission Grapes; \$10.

L. A. Gould, best exhibit of Quinces; \$10.

H. F. Hutchinson, best exhibit of Figs; \$10.

J. M. Patterson, best exhibit of Prunes; \$10.

Wilson Bros., best exhibit of California Oranges; \$15.

M. Keller, best exhibit of California Lemons; \$10.

B. F. Fox, best exhibit of Strawberries; \$7.50.

J. M. Patterson, best exhibit of blackberries; \$5.

H. F. Hutchinson, best exhibit of Dried Fruits; Silver Medal.

J. M. Patterson, best exhibit of Prunes (cured); Diploma.

H. F. Hutchinson, best exhibit of Figs (cured); Diploma.

P. D. Code, best exhibit of Canned Fruits; Diploma.

The attendance has been large and brilliant, especially during the evening. The visitors seem to take great delight in wandering around through the various avenues and aisles, gazing with wonder-stricken eyes upon the novel and beautiful display. The music is quite a feature, as how can it be otherwise, when such musical celebrities as Levy, Harvey, Schlotte, and other musicians are among the performers.

Among the novelties that have made their appearance are some goma oil plants, and tea plants from Schnell's plantation in El Dorado, and some California-made tea from the same source. The Ramie plant exhibited by John S. Finch, of Alameda, also attracts much attention.

EARTHQUAKE.—At Shasta, Aug. 30th, two small shocks, from west to east, were felt a little after 8 p. m.

COD-FISH ESTABLISHMENT.—Messrs. F. W. McCollum & Co. are to erect a cod-fish establishment near the mouth of Redwood City Creek, on the west side of the Bay. Here the finny tribe will be cured and dried for the delection of their many admirers.

On the 10th of July, Valparaiso had a gale which demolished buildings, etc., etc. to the amount of three or four hundred thousand dollars.

Device for Extracting Broken Drills.

[Written for the Scientific Press.]

EDITORS PRESS:—When I was at Mineral Hill, I saw a very handy device for extracting the part of a drill which may be broken off in drilling a hole. I saw it, as I was visiting a mine, in the hands of Mr. D. R. Northey, who had his idea from a similar contrivance seen by him last year at Austin. As it is so simple that any one can make it, is so efficient, and can be used by any one (not being patented), I send you a rough sketch of it, although the idea is an old one.

In the drawings, A is a piece of gas pipe, about two feet long. B is an iron rod whose two prongs spring apart, and C is the broken drill. The pipe and rod are inserted in the hole (as in Fig. 1) until the prongs are on each side of the drill. Then by pushing the pipe over the prongs (as in Fig. 2), the drill is firmly gripped and can be removed, any pull on B only increasing the grip on C. The device accomplished easily the desired object, when I saw it used. By publishing you may do a considerable benefit to some miner.

W. H. M.

Our Double Sheet.

The present issue of the SCIENTIFIC PRESS contains two full sheets, making 32 pages, or a paper about twice the size of Harper's Weekly. The additional sheet contains "A Guide to Immigrants to California" which is full of valuable facts and statistics—information of real value for personal and preservation by our home readers; and exceedingly desirable for sending to families abroad. We trust this extra size double sheet will amply satisfy our readers for the omission on account of the printers' strike, of our usual 8-page extra on the first of last month, that our extra trouble and expense in that instance will be fully appreciated by the intelligent reading public—who are almost universally in favor of advancing home manufactures and industry.

Extra copies of the Guide alone will be sold for 15 cents.

THE NEW REFORM MOVEMENT IN UTAH.—We have had the pleasure, the past week of a call from Mr. Walter Shearman, the editor of the Salt Lake Tribune, the organ of the new reform movement in Utah. This is the first movement against the "one man power" of the Mormon organization, and bids fair to accomplish much good, in the way of bringing about a peaceable and quiet solution of the "Mormon problem." The mission of Mr. S to this State is in part as an accredited agent, to raise funds for the building of a large Hall or Meeting House for the use of the reform party of Salt Lake. The reformers are poor and have many calls for money to sustain their movement, and we presume his appeals to our citizens will not be made in vain.

The erection of such a hall is considered a positive necessity in carrying on this work of reform.

SCIENTIFIC PRESS.

EXTRA DOUBLE SHEET.

San Francisco, Cal., September 3, 1870.

DOUBLE SHEET—32 PAGES.

Our regular issue of the SCIENTIFIC PRESS, for Sept. 3d, 1870, contains 32 pages. A large edition of Extra copies of the 16 page sheet containing the Guide for California Immigrants, will be printed and sold separately. Price 15 cents.

The Great Century Plant.

Among the famous plants which have been popularly endowed with mythological characteristics, the American Aloe,—scientifically denominated the *Agave Americana*, and very commonly called the Century Plant,—is entitled to a high place. Born in the tropical regions of America, the plant has been transported to many other parts of the world, and now is not uncommon as a hot house plant in Northern Europe, and as a perfectly naturalized product of the warmer portions of Southern Europe and Africa.

Although the American Aloe does not require the whole of a century to come to maturity, yet it may take quite a long period before it gets ready to flower, and when it has once made up its mind so to do, it devotes itself so energetically to the task, that, on its completion, it has no strength for further existence, and dies in propagating its species.

Over in the garden spot across the Bay called Oakland, there has been growing for some seven years, in the handsome grounds of Gen. R. W. Kirkham, one of these curiosities of nature. How old it is, or who its parents were, or where was its native spot, is unknown. But there it has been slowly growing and storing up strength and sustenance for future need in its circular cluster of fleshy, spiny, sharp-pointed leaves. Nobody noticed it particularly, nor was its appearance particularly deserving of notice. But last spring it turned over a new leaf and sent out a stem that grew with an almost visible velocity. As the tall spire kept reaching out and getting up higher, people began to go out to the General's place to see it, and weekly reports of progress were brought to us. When the clusters of greenish-yellow flowers opened out some thirty feet up in the air, then everybody told everybody that the century plant had bloomed, and the Press whispered softly in the ears of Mr. Burgess, the artist, and Mr. Burgess took a trip to Oakland, and what he brought back, all our readers have here an opportunity to see. This was before the leaves had drooped.

Now if that plant had grown in Mexico, it might have been badly wounded in the stem with sharp knives, and its life's blood pouring out might have been fermented and become "pulque" so much liked by our neighbors, or further distilled and, as "vino mecal," have infixed a deleterious spirit into the thirsty natives. Or its leaves might have been broken and the coarse fibers thereof manufactured into a sort of thread. Or from an extract from these leaves balls might have been made

which, rubbed with water, produce a lather like that of soap. Or the dried flower stems might have been used as a thatch to keep off the rain. Or the pith of the stem might have been baked in hot stones and eaten, tasting something like a sweet potato and sugar cane combined. All this might have been, had the plant grown further south, where it is more common.

But growing where it did, it attracted

measurement, 36 feet high, that its cluster of leaves are 16 feet in diameter, and that its stem, six feet above the ground, is 11 inches through. And some, perhaps, may have drawn close to the flowers and been fortunate enough to perceive the wonderful perfume which, to the human nose, may well appear a hundred years old.

But those of our readers who have been unable to attend the Exhibition, may here

THE CENTURY PLANT—AGAVE AMERICANA.

special attention of a person who calls himself S. H. Herring and writeth for the Press. And he, being of fertile invention, conceived the idea of having it carried over to San Francisco and placed in the great Pavilion at the Grand Horticultural Exhibition of the Mechanics' Institute. And Gen. Kirkham, being of a most generous disposition, agreed thereto, and now it has been visited by thousands who have wondered at its size and shape from afar, and, coming nearer, have examined it more closely, and have been told that it is, by

see how the curious plant actually appears. And they will perceive, on the right, a cluster of the flowers (not quite open) and, on the left, a single flower (in full bloom,) drawn of larger size for the sake of clearness. And they may like to know that the calyx of one of these flowers, now before us, is three inches long and of a green color, that the stamens are some two and a half inches long and are greenish yellow. But of the perfume we cannot give them any idea. That each individual must experience for himself.

[Entered according to Act of Congress.]

GUIDE FOR IMMIGRANTS To California.*

BY BENTHAM FABIAN.

For the Scientific Press.

Containing a Description of the Climate and Soil—Natural Wealth and Resources—Productions in Agriculture and Manufactures—The Past, Present, and Future of the State—Agricultural Districts—Public Lands—Laws relating to Preemption and Homesteads—Tables of Statistics from Official Reports—Lands for Sale—Railroads—Routes of Travel—Methods and cost of Travel—Distances—Suggestions to Immigrants—&c.

Chapter I. CALIFORNIA.

Its Discovery—Early History—American Occupation—Geography and Topography—Scenery—Minerals—Present Status—Education—Morals, Society, etc.

DISCOVERY.

The discovery of Upper California is credited to a Spanish navigator named Cabrillo in the year 1542. Subsequently, in the year 1578, it was visited by the famous English navigator Sir Francis Drake. In 1602 the coast was surveyed by Gen. Sebastian Viscaïno under orders from Philip III of Spain, and several harbors were discovered by him.

EARLY HISTORY.

But little is known of the country from that time until 1768-74 when the first permanent settlement of the country was made by the Spanish Jesuit Missionaries, during which years several Missions were established, including one in the harbor of San Francisco, which it is supposed was not discovered before that period. Up to the year 1820 the country was entirely under the control of the Missionaries, although nominally represented by a military governor, their Missions were principally on the coast, and no important settlements had been made inland. In 1822 Mexico threw off the yoke of Spain, assumed an independent Empire under Yturbe, and California became a colony of the New Empire. In 1824 Mexico laid aside the Imperial, and assumed a Republican form of government, and California, on account of the small number of white inhabitants residing within its borders, was not admitted as a State, but allowed the privilege of Territorial rights. This movement on the part of the newly formed Republic was the cause of the disaster which culminated 24 years afterwards in the taking of the country by the United States in order to save it from falling into the hands of the British, on whom in their bickerings and discontent with the mother country, the Californians relied for protection and support. In 1826 a law was passed which proved a death blow to the power of the Missionaries, as it deprived them of their cattle, horses, other animals and emoluments, and appropriated the same to the service of the Republic. A succession of revolutions and

*To those citizens of California who have the interests of the State at heart,—are zealous in devising and adopting means to develop the resources of the country,—and who have an abiding faith in its future—who fully realize the truth of the Axiom that "Labor is Wealth" first in Agriculture, second in Manufactures, and third in the pursuit of such other occupations as are of benefit to society and necessary concomitants to a state of civilization,—and who believe also that one of the leading principles involved in the science of "Political Economy" is the application of capital to the promotion of Home Industries—this Essay is respectfully commended by the AUTHOR.

attempts to form an independent government were, at the instigation of the Catholic Fathers made by the Californians without success. In 1846 the population was estimated at 16,000 white persons, and over double that number of Indians. Of the white population, about 2,000 were citizens of the United States.

AMERICAN OCCUPATION.

In the spring of 1846 Captain (now General) John C. Fremont arrived on the frontier with a U. S. Government command on an exploring expedition. The Californians had for some time been very jealous of American settlers, believing that their ultimate aim was to gain possession of the country, and therefore determined by forcible measures to resist the encroachments of the objectionable intruders. Many indignities were put up with by American residents, and remonstrances on their part and that of U. S. officers of the Army and Navy proving of no avail, a series of engagements took place, which culminated in victory on the side of the Americans, who finally hoisted the American flag in the harbor of Monterey. It has been argued by some writers that the Americans were unnecessarily hasty, but when it is taken into consideration that the British naval force then on the coast had concluded to give, and was on the eve of giving the Californians a British protectorate against the United States and Mexican powers, due allowance will be made for any seeming precipitancy on their part. From this time immigration from the Eastern States began rapidly to flow in. In January, 1848, gold was first discovered at Coloma on the American river, and the onward and rapid progress of California may be based from that time. About a month after the discovery of gold, an armistice between the United States and Mexico was agreed upon, and a treaty of peace ratified by the United States in March, and by Mexico in May.

GEOGRAPHY AND TOPOGRAPHY.

California is about 700 miles long, and has an average breadth of 100 miles. It extends from latitude 32° 45' north to latitude 42° north, and contains about 160,000 square miles, or over 100,000,000 acres, of which 35,000,000 acres are adapted for agricultural purposes, 23,000,000 acres for grazing, 5,000,000 acres are swamp and overflowed lands which may be reclaimed. The lakes, rivers, bays and other surface covered with permanent water, amount to nearly 4,000,000 acres, about 10,000,000 acres consist of arid plains and deserts, the balance 23,000,000 acres being covered with rugged, and for the most part heavily timbered mountains. There are two ranges of mountains which traverse the State from north to south—the Sierra Nevada on its eastern border, and the Coast Range, as its name denotes, on its western border.

SCENERY.

The scenery of California combines the grand and the picturesque. There are two ranges of mountains running the whole length of the State, one at the eastern extremity known as the Sierras, and another at the western called the Coast Range. Between the two ranges there is an unbroken valley which bears evidence of having been ages ago a basin of water. A peculiar sight that arrests the attention of the stranger in California, is that from the valleys during the summer months when the heat is oppressive, he can look upon everlasting snow on the mountain tops of the Sierra Nevada. The mountain ranges are filled with innumerable smaller valleys; those in the Coast Range are the largest and most beautiful, while those in the Mountain Range reach a higher elevation, in some instances 8,000 feet, and enclosing charming lakes. Mount Whitney, the highest mountain of the Sierra, has an elevation of 16,000 feet, and is surrounded by many others at least 13,000 feet high. The average height of the range may be set down at 8,000 feet. In this range of mountains are groves of the largest and oldest trees in the world.

The Yosemite Valley is a chasm ten miles long, two miles wide, and 3,000 feet deep within the heart of the Sierra Nevada, without an equal in the world for sublime and picturesque scenery. It has a dozen great cascades, the highest of which has a fall of 1,300 feet. The Mammoth Trees are the largest known growths of the vegetable kingdom. There are likewise in the State mud volcanoes, natural bridges, many caves, and numerous hot and mineral springs, some of which throw out great columns of steam.

MINERALS.

The mountains abound with ores, precious and other metals, and minerals. Chief in importance are gold, silver, copper, quicksilver, iron and coal. Borax, sulphur and common salt are also found in considerable quantities.

Although it is not intended in the present essay to dwell upon the subject of mining matters, the object being more especially to portray the Agricultural and Manufacturing resources, yet it may be interesting to our readers to know something about the products of precious metals.

The receipts of Treasure (gold and silver,) from all sources through regular public channels during the past six months, as compared with those of a like period of 1869, were as follows:

	1869.	1870.
From North'n & South'n Mines..	\$23,542,546	\$18,593,364
From Coastwise.....	\$1,949,808	\$1,959,825

The total receipts of Treasure from all sources since 1849, amount to somewhere in the neighborhood of \$1,150,000,000. These estimates of course includes much of the products of Nevada State and Territories north and south.

The gold yield of California has been decreasing, partly from working out of the rich placer or surface diggings, and the departure of gold seekers

to newly discovered diggings in neighbouring districts. The following table shows the yield of gold in California alone, as nearly as can be estimated, from 1848 to 1870:

1848.....	\$10,000,000	1860.....	45,000,000
1849.....	40,000,000	1861.....	40,000,000
1850.....	50,000,000	1862.....	34,700,000
1851.....	55,000,000	1863.....	30,000,000
1852.....	60,000,000	1864.....	26,600,000
1853.....	65,000,000	1865.....	25,500,000
1854.....	60,000,000	1866.....	26,500,000
1855.....	55,000,000	1867.....	25,000,000
1856.....	55,000,000	1868.....	22,000,000
1857.....	55,000,000	1869.....	21,000,000
1858.....	50,000,000		
1859.....	50,000,000	Total.....	\$904,300,000

PRESENT STATUS.

In November, 1869, the population of the State was estimated at 670,000, composed of various races, as follows: White, 485,000; colored, 10,000; Chinese, 66,000; and the balance civilized and wild Indians.

The value of real estate at the same period was \$137,167,417; improvements, \$18,098,097; personal property, \$86,809,006; and the total valuation, \$242,074,620.

The following commercial summary from the San Francisco News Letter of July 16th contains much useful information:

COMMERCIAL DOTTINGS FOR PAST SIX MONTHS.—Tonnage arrivals, 616,000 tons, or about 40,000 tons less than for the same time last year. Foreign imports for the six months cost us, exclusive of duties, about \$8,000,000, or adding duties, \$12,000, an increase of at least \$1,000,000, as against the same time last year. Duties collected on imports for the six months not quite \$4,000,000, while for the fiscal year the amount was \$8,600,000, the largest amount collected for any similar period. From Internal revenue there was collected in the district the sum of \$1,685,000 for the six months, and \$3,150,000 for the year. Our exports of merchandise for the half year, by way of the sea, amounted to \$6,890,000, a decrease of nearly \$2,000,000 from 1869. Included in the merchandise exports for the past six months was \$5,210,000 for California products. During the harvest year ending June 30th, merchandise exports amounted to \$18,990,800, a decrease of \$2,854,000 as compared with the previous harvest year. Of the amount for the past harvest year, \$9,958,400 was for flour and wheat, \$422,000 for wine, \$2,495,500 for wool, \$381,000 for hides, \$178,500 for leather, \$264,000 for skins and furs, \$674,000 for quicksilver, and \$381,000 for ores. The dividends paid for various local incorporations for the past six months show an aggregate of \$2,487,000 exclusive of the amounts paid depositors by the savings banks. The sales of the Stock Board for the half year amounted to \$29,692,000. The real estate sales amounted to \$8,750,000, a decrease of \$12,250,000 as against same time in 1869. Adding through passengers per railroad to those by sea, gives us a total of about 30,900 against 15,000 departures.

The productions from agriculture and manufactures will be found under their appropriate heads in another part of this work.

EDUCATION, MORALS, SOCIETY, ETC.

The Common School system of California is modeled after that of New York; the teaching thorough, and the teachers only permitted to assume their responsible positions after passing through a rigid examination. No State in the Union possesses a more enlightened educational system, nor one from which better results flow.

The laxity of morals of early days has been improved by the large influx of the female sex, and the influence women have to ennoble man and regenerate society; the formation of homes and settled habitations, and the general entrance of the population into legitimate pursuits. In a social point of view the standard of morality is high; the Christian Sabbath is observed and respected, and society compares favorably with that of an old settled community in the Atlantic States. There is hardly a trace of the newness of the country to be observed, other than in improvements. All the conveniences and appliances of civilization are here; and in no form do relics of a pioneer life appear. Probably in no part of the United States do the farmers generally live so well, either producing, or having within the easy command of money nearly everything relishable from the air, earth or water, and at prices within the reach of moderate means.

The population of California is more homogeneous than that of any other part of the world. All nationalities are here, and all meet on a common plane, learn to know each other, give up sectional prejudices, and assimilate and fuse into a cosmopolitan whole. Differences in political and religious belief never disturb the general equanimity, for antagonists and sectionalists have been brought into close contact, and learn to know that dislikes are the result of prejudice and feeling rather than of reason and sensible judgment.

Chapter II.

CLIMATE.

General Features—Variations of Heat and Cold—Rain—Relation of Climate to Agriculture—Health.

GENERAL FEATURES.

The climate of California, in general character, resembles that of Western Europe; the changes from heat to cold are neither great nor frequent; there is but little difference between the temperatures of summer and winter. The summer months from April to October are dry and without rain, except at rare intervals. The winter months from November to March constitute the rainy season.

The western slope of the Coast Range is subject during the summer season to heavy fogs, which are drifted in from the ocean. They are deposited at the foothills and on the slopes of the highlands, which add materially to the richness of the soil, and renders it so peculiarly applicable for grazing and dairy purposes. High up on the mountain ranges and summits of the Sierra Nevada extreme cold and everlasting snow are prevalent. The climate of the valleys between the two mountain ranges is not excelled by any other in the world.

VARIATIONS OF HEAT AND COLD.

The variations of heat between the northern and southern counties are not excessive, as the following table will show:

LOCALITIES.	SPR.	SUM.	AUT.	WIN.	AV. PR YR.
Humboldt Bay...	52.0.	57.6.	63.0.	48.5.	51.5.
San Francisco...	66.5.	60.0.	59.0.	61.0.	66.6.
Sacramento.....	56.0.	69.5.	61.0.	46.5.	58.0.
San Diego.....	60.0.	71.0.	64.5.	52.5.	62.0.

One feature that strikes the new comer to California very strangely is the great disparity in temperature found in different portions of the State in summer, and to a less but yet decided degree in winter. While the inhabitants of San Francisco are visited from May to October with strong north-west winds, and chilled with wet fogs so that woolen clothing is universally used, less than one hundred miles distant in the interior valleys and plains the lightest summer clothing is all that can be comfortably borne. The temperature of the interior valleys from May to October averages about ninety degrees Fahrenheit during the day, but the heat is so devoid of moisture that it can be borne with less unpleasantness or distress than a much less degree of warmth in the Mississippi Valley or Atlantic States. Thunder and lightning is of extreme rarity in California, but in its absence a very large amount of latent electricity prevails in the air, which is claimed to be of great benefit to health.

RAIN.

In the entire absence of rain during one portion of the year, and its restriction to another portion, California has but one climate. There is this difference, however, between one part and another: that the rain commences sooner and continues later in the north, and that both the quantity of the rain and the durations of the rainy season diminish on approaching the southern part of the State, or rather on receding from the mountainous section. The following table will show the average quantity of rain in inches which falls during the four seasons at different points, with the yearly aggregate:

LOCALITIES.	SPR.	SUM.	AUT.	WIN.	AG YR.
Humboldt Bay...	13.51.	1.18.	4.87.	15.03.	34.66.
San Francisco...	6.64.	0.13.	3.31.	11.33.	21.41.
Sacramento.....	7.01.	0.00.	2.61.	12.11.	21.73.
San Diego.....	2.74.	0.65.	1.24.	5.90.	10.43.

Very nearly the same quantity falls in the valleys surrounding the Bay of San Francisco, and also in the Sacramento Valley. The fall in Sonoma and Napa counties is rather greater, and in Santa Clara rather less. The rainfall in the southern counties is not more than one-half of that of San Francisco.

RELATION OF CLIMATE TO AGRICULTURE.

The farmer in California can work nearly all the year; he can commence plowing and sowing with the first rains in the fall—about November—and continue until January. From that time until the middle of April he can summer-fallow; which experience has shown to be both the safe and true method of tilling our soil; then haying commences, and lasts until the end of June, and the succeeding five months are devoted to harvesting the crops; this over, he can put in his summer fallow, or leave the land to spontaneous or volunteer crops, and be prepared for winter plowing at the commencement of the rains. Owing to the absence of frost, fresh vegetables are in the market all the year round. New potatoes frequently make their first appearance in March. The climate is very favorable to fruit; cherries begin to appear about the middle of May, and are found in the market until the end of July. Strawberries come in about April, but when the winter is mild are exposed for sale all the year round. All sorts of fruit may be dried with little care or attention, the absence of dews rendering no covering at night necessary.

HEALTH.

The climate of California appears to be peculiarly propitious in its relation to the physical development of animals, including man. No amount of labor or exposure to the elements seems to affect health, which is preserved in a remarkable degree. The dryness of the air promotes rapid perspiration, which favors rest and recuperation. There is no climate in the world in which one sleeps so comfortably all the year round, and can occupy so many hours out of the twenty-four with satisfactory results. The climate is remarkably adverse to epidemic diseases. During summer the residents in and about San Francisco Bay are subject to influenza. Malarious fevers are somewhat prevalent in the interior valleys, but not of a severe type. Insanity and diseases of the heart, and blood vessels are frequent; but this is due rather to moral and physical causes than to climate influence. Children are almost invariably healthy and robust, and remarkable for good looks and well developed forms.

Chapter III.

AGRICULTURE.

General Remarks—Annual Report of Surveyor General of the State—Diversified Farming—Prices of Land—Dairy Farming, Cattle and Horses—Sheep—Culture of the Grape or Viticulture—Silk Culture—The Tea Plant—Sugar Beet—Agricultural Implements—Labor.

GENERAL REMARKS.

No country in the world offers to the farmer greater inducements than California; the climate and soil are so variable that almost everything in the vegetable world can be cultivated. Probably no equal portion of the earth's surface is so well calculated to sustain a diversified and profitable agriculture as California. All the products of the temperate, and many of those of the tropical climates flourish with equal luxuriance. Nature seems to have marked out California as the special country of agriculturists. Her thousands of valleys and innumerable mountain and hill sides containing as valuable land as the world has ever known, fully attest such a theory. Such is the mildness of the climate that neither food nor shelter is required to be provided for stock during the winter season. The grain when threshed lies out in the field, and the necessity of building barns is almost dispensed with. In some parts of the State the farmer in the winter season need spend but little money in meat provisions, as his gun will amply supply the wants of his household. Quail may be shot by thousands, deer are abundant, and the country swarms with wild duck, geese, rabbits, and other descriptions of game. In the summer time the delicious trout to be caught in the numerous brooks form an acceptable addition to the farmer's table. California wheat is unsurpassed in quality by any in the world, and commands a high price in Eastern and European markets. It took the prize at the World's Fair in Paris. Two crops are produced from one seeding, the second being termed the volunteer crop which springs up without any cultivation from the seed lost on the ground after the removal of the first crop.

ANNUAL REPORT OF THE SURVEYOR GENERAL.

The returns of the County Assessors to the Surveyor General of the State for the years 1868-69, show that there were 2,132,150 acres under cultivation, and 4,463,127 acres enclosed, and the following is a summary of their tabular statements:

NAME OF PRO'DT.	ACRES.	BUSHEL.	AV. ACRE.
Wheat.....	1,118,891	19,651,984	17½
Barley.....	362,839	7,321,333	20 2-5
Oats.....	79,064	2,568,769	32½

Hides, No.	60,097	56,946

DIVERSIFIED FARMING.

The climate and soil of California are so varied that almost everything which the earth produces can be raised here with great success. All the cereals, vegetables of every name and description, fruit of every variety, not excepting the tropical orange, olive, fig, lemon, pomegranate, prune, date, banana, etc., can be raised in almost every portion of central and southern California. The grape for raisins and wines, and the mulberry for silks, flourish here in their greatest perfection, and no land or climate is better suited to the cultivation of the poppy for opium. Experiments have already quite fully shown that we can produce our own tea, while coffee will eventually be a certain success in the lower portion of the State. Our mountains, while they abound in almost every mineral known to the arts, furnish herbage sufficient to produce all the wool needed to clothe forty millions of people, and water power for its manufacture into cloth. The navies of the world might also be constructed from the timber which grows on their slopes.

Diversified farming encourages industry and application on the farm, it leads to intelligent action in the selection of crops and in their application to the soil, as well as their proper rotation; it economises the farmer's labors and expenditures; it tends to subdivision of our lands into smaller sections, whereby they are more thoroughly tilled; it fills up the State with an industrious population; furnishes a home interchange of products, encourages manufactures, and thereby greatly enlarges the market for its own surplus.

The growing of any one crop to the exclusion of others is always to be deprecated. It stakes success on a single enterprise; it is an exhaustive system of agriculture; it affords no opportunities for the general average which, under the diversified system, makes profit and loss a uniform success; it crowds the work of the entire year into a few months, thereby necessitating hard economy in labor; it compels the farmer of small capital to annually hypothecate his crops at ruinous discounts; it is a short-sighted, ruinous policy for the great mass of producers in every possible aspect in which we may view it; in short, it is the very antipodes in its results of diversified farming.

PRICES OF LAND.

In general, land is cheap and much of it open to pre-emption under United States laws, as set forth in another part of this work. There are millions of acres of swamp lands within the borders of the State which can be brought into cultivation at a cost not exceeding \$3 to \$5 per acre. Upon this subject the reader is referred to a special article. The prices of agricultural lands owned by corporations and private individuals average from \$2.50 to \$10 per acre. In the separate descriptions of counties, full information on this point will be found.

DAIRY FARMING.

Is one of the most profitable sources of wealth in the State. Almost the whole of the land on the Coast Range and adjacent valleys is adapted to grazing purposes; it is full of springs and evergreen nooks; the natural grasses are very nutritious, consisting of alfalfa, burr clover, bunch grass and wild oats. During the year 1869 over \$1,000,000 worth of butter was imported from the Eastern States—not on account of its superior quality, as California butter and cheese is not excelled by any other in the world; but simply because the supply made at home was not adequate to the demand.

CATTLE AND HORSES.

The raising of stock in California is attended with less expense, perhaps, than in any other part of the world. The rich native grasses sown broadcast over the land afford abundant support to stock, if we except those occasional droughts—fortunately few and far between—when vegetation ceases for want of moisture, and man and beast are alike sufferers. The native Mexican mustang is the horse that is in general use, and invaluable for his excellent qualities and great endurance. The magnificent breeds of horses that have been introduced from other countries are, if anything, improved by the climate of California; and the care exhibited in preserving pure the herds of imported stock, gives the best assurance that at no distant day California will be able to boast of possessing the purest horses in the United States.

It is to be regretted that the same character is not likely to be attained by our cattle. Although the most valuable bulls have been imported, the stock has not been kept select. The large consumption of butchers' meat has caused a great demand for everything in the shape of cattle, and the consequence is that the temptation to breed "in and in" has proved too great to preserve the purity of the breed. If this fault is not rectified by our graziers before long, we shall have little more than an inferior and weedy stock to fatten on our fertile pastures.

SHEEP.

The mountain pastures of this State are admirably adapted for the grazing of sheep, and compare favorably with the "sheep-runs" of Australia and New Zealand, in which countries diseases unknown to California materially deteriorate from the value of the flock. The climate being of such a mild temperature all the year round, is particularly favorable to increase, and the result is, a larger percentage accrues to the sheep farmer from the multiplication of his flock, than is the case in almost any other country.

CULTURE OF THE GRAPE, OR VINI-CULTURE.

This very important branch of husbandry is second to none among the productions from the soil, and is cultivated all over the State; but the particular home of the grape vine is the southern counties, chiefly Los Angeles. By the last report of the Surveyor General, it was estimated that the number of grape vines then in the State numbered 22,402,580; gallons of wine manufactured, 2,587,764; besides 237,333 gallons of brandy. Every description of grape is grown, each applicable to the particular class of wine manufactured from it.

Of the different classes of wines manufactured from native grapes, the following are the most prominent: white wine of the stock kind, port, sherry, maderia, champagne and angelica. The culture of foreign grapes is being largely encouraged with satisfactory results. The Black Hamburg for claret, Reising for hock, Chasselas for Sauterne, Isabella, Catawba, Muscat, Tokay, and Tinto. All thrive well and produce excellent wines.

The manufacture of California wines and brandies is a business of great magnitude, and on account of the superior quality of the article is much sought after by our neighbors in the Eastern States, and in consequence has become a leading article among our exports. We append an extract from the report of the Senate Committee on the "Culture of the Grape," made during the sitting of the last Legislature of the State, which, being official, is sufficient evidence of its reliability:

REPORT.

Perhaps no other country on the globe, and certainly no other portion of the American continent, is so well adapted, in all respects, to the successful and profitable cultivation of the grape as the State of California, which, indeed, seems, as it were, to be the natural home of the grape, where it grows readily, from cuttings, upon the most arid hill-sides, and without irrigation.

The culture of the grape gives more employment to labor than any other branch of farming, and its development will tend greatly to the rapid peopling of our State with immigrants from among the honest, industrious and moral natives of the wine-growing districts of Europe.

To the immigrant who comes to California without means, with the expectation of a dependence upon farm labor for support, the districts devoted solely to the culture of the cereals offer small inducements; for, while the demand for labor is comparatively great and the pay liberal, for a short period during the rush of gathering and harvesting the crop, it is succeeded by a long period of inaction, when there is little or no need of hired labor, and the employee is turned adrift, perhaps to suffer from want before another job offers; besides, in our country, where the use of labor saving machinery in agriculture is so universal, the demand for manual labor is comparatively small, and is decreasing every year. This is not the case in vine culture; the careful planting and annual pruning of the vines, and the gathering of the ripened fruit, can only be done by the employment of human hands.

The growing of the grape is not in conflict with any other branch of agricultural industry, but can be made auxiliary to nearly all other kinds of farm labor, as for example: if you raise grain, your seedling is over before the labor of pruning the vine commences, and at the time of grain harvest there is little or no work required in the vineyard; and if the cultivation of the mulberry and feeding the silkworm should prove a success in California, its prosecution will present no conflict with the vintage work. And in a country blessed with so genial a climate and fruitful a soil as California, where all these several branches of agricultural industry—grain growing, stock raising, vine culture and rearing the silkworm—can successfully be blended together and practised in the same district, skilled and willing labor can find an abundant field, with continuous employment, at remunerative wages the year round. Let this fact be known to the world, and this alone will do more to encourage and induce immigration hither than any proposed expensive scheme of "Immigrant Aid Societies, with State appropriations, which, at best, will go no farther than to pay the traveling expenses of the immigrant to our State, and then leave him destitute, a stranger in a strange land, with no branch of industry provided for him wherein he may labor and acquire the necessities of life.

A large portion of California, in its present condition, is neither useful nor ornamental, bearing no green trees, and yielding no pasture for grazing purposes; yet, how valuable and ornamental could nearly the whole—of what is to-day so unseemly—he made, by planting vines and fruit trees.

Meteorologists tell us, that by planting trees and shading the dry ground, the moisture of the atmosphere is increased and more rain produced; and surely California, with her long, dry, torrid summers, needs all the advantages which would accrue from having her barren lands cultivated and her hillsides covered with verdure, thus increasing the supply of rain, and materially benefiting the grain grower and grazer.

The vine, even when growing upon the thin and almost arid soil of the mountain slopes, does not suffer from drought, as do the grain crops of the

valleys below; indeed, it is to the vineyards, upon these otherwise barren and desolate hillsides, that we must look for our most delicate and finest flavored wines and brandies. Neither does the cultivation of the grape exhaust the soil as the cereals do; there are vineyards in Los Angeles said to be one hundred years old, which still bear full crops every year.

Much of the soil of California is only suitable to the growing of fruits. In order to make fruit growing a success, it is necessary to grow all of the various varieties to which our soil and climate may be adapted; the most important of which, for general culture, is the grape, of its various kinds.

SILK CULTURE.

This is destined to become one of the most important branches of agriculture. The State is indebted to the late Mr. L. Prevost, of San Jose, Santa Clara County, for commencing and successfully carrying out this branch of industry. The mulberry tree thrives wonderfully in the soil of California. The leaves of the tree, the silkworms, the climate, and the silk produced excel that of any other country. The number of trees in the State by last official returns was 374,125, and is rapidly increasing—the production of eggs keeping pace with the same. The demand from France for California eggs on account of their superiority is so large, and the sale of them so profitable to the producer that the manufacture of silk fabrics is not considered at present a commercial advantage, although many fine textiles have been woven. Two crops of cocoons are raised during the year, viz, in May and July, the whole process occupying six weeks. Artificial heat is not needed, which is an immense advantage.

The peculiar adaptability of the climate for raising the silkworm has attracted much attention in Europe, and there is every reason to believe that at some future day the State will take the lead of all silk producing countries.

THE TEA PLANT.

The adaptability of the soil and climate for rearing the tea plant, has attracted the attention of the Japanese, and two plantations have already been started, one near Placerville, El Dorado County, containing 110 acres of land, having 200,000 plants already in the ground; another near Calistoga, Napa County, which has scarcely been commenced. There are 300,000 plants on the ground ready for planting. Both plantations are superintended by experienced Japanese tea cultivators, who are so satisfied of ultimate success, that they have sent home for a number of their countrymen to come out and colonize. The Japanese appear much to excel the Chinese as agriculturists.

THE SUGAR BEET.

This vegetable grows to an enormous size, and is easily cultivated. It is richer by four per cent. in saccharine matter than that of either France or Germany. A great advantage in this country is, that on account of the absence of frost, it can remain in the ground through the winter months, increasing in size, until required for milling purposes; thereby saving the labor and expense of storage, besides retaining its saccharine quality intact. The root undergoes a chemical change when exposed to the air, and gradually loses much of its sweetness.

This branch of industry has for some time past excited great interest, and arrangements have been made for the erection of suitable establishments for milling the root, and the manufacture of sugar from the juice extracted therefrom. The establishment of such an enterprise will be the means of supplying in part the consumption of sugar in California by an article of home production.

AGRICULTURAL IMPLEMENTS.

Agricultural implements, to a large extent, are being manufactured in this State, and are gradually but surely displacing those heretofore sent from the East. As the same rules for farming are not common to this and other parts of the States, but require alteration and modification, so with regard to agricultural implements. What is found to be a very useful machine on the farms of the East is not appreciated here, and is superseded by one better adapted to the peculiar soil, and to the extensive scale on which farming generally (to be profitable) is carried on in California.

LABOR.

Labor for agricultural purposes is plentiful, and can be hired on yearly contracts at rates sufficiently low to afford the farmer a handsome profit. In the city of San Francisco there is a Labor and Employment Exchange which has been established and in successful operation for the past two years. The services rendered to both employer and employed are entirely gratuitous. It is supported by voluntary contributions, and a monthly subsidy from the State.

Chapter IV.

AGRICULTURAL DISTRICTS.

The Valley of San Joaquin—The Southern Counties—Swamp and Tule Lands.

With a view to facilitate the immigrant in selecting suitable land whereon to settle, we devote a chapter specially to the purpose.

SAN JOAQUIN VALLEY.

The following is extracted from an interesting sketch of the great San Joaquin Valley Basin which appeared in the Stockton Independent of May 2d, 1868.

TOPOGRAPHY AND GENERAL FEATURES.

The basin of the San Joaquin river and its tributary streams contains the largest area of arable and pastoral lands, in a connected body in California. Its watershed reaches from the dividing summit of the Sierra Nevada chain of mountains on the east, the Coast Range on the west and south, and the dividing streams of the Sacramento river on the north—embracing the counties of Kern, Tulare, Fresno, Merced, Stanislaus, San Joaquin, Mariposa, Calaveras and Tuolumne. Its shape is that of a parallelogram whose greatest length is 250 miles, running northwardly; greatest width 40 miles, with an area estimated at 24,000 square miles, or 15,560,000 acres, diversified into tillable, pastoral and mineral land. A more minute division shows approximately, 1,000,000 acres of salt marsh and tule lands, 5,000,000 acres of mineral and mountain lands, leaving over 9,000,000 acres that are adapted to cultivation or pastoral purposes, a small quantity only being supposed too sterile for economical uses. The San Joaquin Valley proper, embraces about one-half of this territory the wide foothills and higher elevations of the Sierra Nevada range occupying the remainder—the low altitude and abrupt rise of the Coast Range forming only a narrow plateau. The foothills and lower elevations of both ranges possess many table lands and small valleys adapted to cultivation of the vine and to horticulture, or to sheep husbandry. On their sunny slopes the grape and table fruits attain rare perfection. The land in the northern portion is nearly all adapted to tillage, with or without irrigation, and is moderately well watered by numerous perennial streams, and by the San Joaquin river. It is level or slightly undulating, only a few feet above tide-water, with an occasional low, gravelly knoll and sink or depression, to diversify the general monotony of the landscape. Little timber occurs even along water courses, and that of a poor character except for fuel. This northern portion embraces the finest lands for the cereals and plants of temperate climes, within the valley, which will approximate half its arable extent. The southern portion of the valley presents a more arid surface and sterile soil, broken up by fresh water lakes, extensive swamps, alkaline deserts and detached groups of hills and mountains. The river bottoms are extremely fertile, but contiguous to the San Joaquin river and Tulare lake, extensive swamps exist, that require reclamation before they become adapted to tillage, when their fertility is exuberant. The San Joaquin river meanders its tortuous course nearly centrally through over one-half the length of the valley, and from the eastern slope receives all of its tributaries at any moment, the low elevation of the Coast Range giving origin to only a few small winter streams. Hence, while the eastern slope is extremely fertile, the western part is arid, treeless, and, without irrigation, only susceptible to sheep husbandry. In the swamps of the Tulare region one branch of the San Joaquin has its rise, from which its headwaters are only separated by a slight elevation that the winter freshets overcome. The Sierras to the eastward attain their greatest altitude—some of the peaks, Mt. Whitney and Mt. Kaweah, rising to a height of 15,000 feet—being the most lofty land known on the North American continent. Here, too, along this cyclopean range, the marvels of the vegetable kingdom have existence in the *Washingtonia gigantea*, or "Big Trees" of California, standing like gigantic sentinels, as if disputing supremacy with the towering summits they fringe. The general topography and geological features indicate that this valley has been the bed of a vast inland sea, whose tranquil waters for ages have received the wash and wear of the surrounding mountains, until at the northern and lowest depression deposits of diluvium thousands of feet deep have been made, which have been superimposed by the present soil during the subsidence of the waters. The foothills also bear traces of having been water worn by some mighty stream, and are covered by gravel, decomposed lava, and the humus of ages. From their bases the land gently descends, and does not lose its volcanic soil until reaching the general level of the plain. No great convulsion of Nature has ever upheaved the valley from the peaceful condition the gradual subsidence of waters left it in, but it lies placid and serene as a sleeping child awaiting some event to waken it into life and action. The soil of the whole valley is very unequal. In the upper portion, rich sandy loam, adobe, red ferruginous, and sterile gravelly soil, may all prevail on the same mile square. But the prevailing constituents of the soil render it the finest land for the cereals and fruits of temperate and semi-tropical regions on the continent. In the southern section, and along the foothills, certain specialties of production are highly favored.

The San Joaquin Valley may be said to possess no picturesque scenery. Like the prairies of the West, it is a vast, undulating plain or dead level, with an occasional tree or park of oaks to diversify the general monotony. No timber of account springs up along the streams, no thickets of green shrubbery relieve the eye, no murmuring rills disturb the ear, but through the ferrid plains of autumn the waters sluggishly wonder laden with the ochery sediment of distant placer mines. Yet within the sight at a slight elevation above the horizon the view changes. The mountains rise in Olympian majesty, their bases running off into gentle slopes or rugged spurs, cut up into innumerable configurations of landscape, while their dull brownish outline is relieved by groves of evergreen timber, and their upper summits are sparkling with snow or lost in the empyrean vault of heaven. If the flatness and tameness of the valley is insipid, the grandeur of the mountain scenery inspires a feeling of awe and sublimity. Yet the valleys for a few months of the early year have

a tranquil, modest beauty in their verdurous monotony; but nothing is more desolate than the plains in the autumn months when the herbage has been scorched sere and brown, and even the homely fact of its still existing nutritious qualities does not recompense for the lack of inspiring influences the scene gives to nature. Seen in this phase, so different from all home associations, one wonders not that the early adventurers never dreamed of the riches slumbering in the soil—which were so unprepossessing an aspect—but only believed in the mineral wealth they came to seek. The wonder of the Alpine scenery, the Yosemite Falls, on the headwaters of the Merced, a stream of considerable magnitude, precipitates itself at the first fall, a sheer perpendicular descent of 1,600 feet, and a succeeding fall is 424 feet. There are other falls—one of 700 feet, another of 750 feet, and a third of 300 feet, on a branch of the same stream. They are in the region of elevated peaks and rugged precipices, one of which has a perpendicular descent of 4,000 feet. In this region and the mountain region for 200 miles, the most sublime Alpine scenery is to be found, which annually attracts many curious visitors. The Coast Range does not exceed an average altitude of 3,000 feet, and in fertile portions is covered to the summit with wild indigenous oats that give to them in the spring season a peculiarly lovely grandeur. The plains at this season are clothed in green verdure, into which intermingles the golden lily and myriads of native wild flowers; and the cheerful pipings of the lark, quail, and myriads of feathered songsters make the air vocal with their notes. In the Tulare country, along the Kahwean and King's rivers, the virgin soil gives growth to beautiful groves of cottonwood and sycamore, and their margins are fringed with perennial verdure. Climate and soil conspire to give birth to the most picturesque sylvan scenery, and grandest monuments of Nature. Here will become in future years, the tropical paradise of California.

AGRICULTURE AND PRODUCTIONS.

The large extent, undoubted fertility, and known capabilities of the lands of the San Joaquin Valley, give assurance that agriculture will become the predominant interest of the people. The cultivation of the soil is the first industry of nations, and while there are cogent reasons why it should be the principal in this section, there are subsidiary industries that open large fields for capital and enterprise, the second interest in importance being the development of the rich and extensive gold fields, copper and quicksilver mines, and metaliferous and carbonaceous veins. Water power unlimited in amount, also directs to future important mechanical and commercial manufactures. The systems of tillage pursued in California are not identical with those of any other portion of the United States, and are in a great measure still primitive and experimental. But enough is known to take advantage of the climate, seasons and fertile soil, yet the knowledge is not sufficient to grasp the whole capabilities of the situation. Owing to this, agriculture is barely developed to a condition that it may be said the capabilities of the soil and climate are unlimited for the culture of nearly every known useful vegetable production indigenous to the temperate and semi-tropical zones of the earth. What is true of the whole State in a general sense, may be particularly said of the San Joaquin Valley, which possesses a diversity of soil and climate, plain and mountain arable land, adapting it to an extended variety of cultivation and production. The valley of the San Joaquin is equally as favorable to the pastoral interest, the climate being peculiarly well adapted to domestic animals, and their rapid increase, their prolificness being in a much more rapid ratio than in Atlantic countries.

The principal staples which the soil and climate of this valley favor are the cereal grains. Wild oats are indigenous to the country, and on lands allowed to run wild will run out other small grains, but are only cultivated as a forage plant, which, out while green, makes excellent hay. Barley also thrives well, and in a green state is often cut for hay. But the great staple, from being the "staff of life," and the ease of cultivation over other products in this climate, is wheat. In a moderately rainy season it is capable of perfecting its growth before the heats of summer have evaporated the moisture from the roots, and a crop is nearly sure of being made. No disease, rust, or insect harms the grain, although smut was in early days very prevalent, but by proper treatment has nearly disappeared. There has always been a good demand for the surplus crop of this cereal, in the mines and for export, and its cultivation has been profitable. The system pursued in general vogue in putting in a crop has been to plow the field as soon as practicable after the first heavy December rains, and immediately sow and harrow in before the ground becomes sodden. The growing grain thus has the benefit of all the rains of the season, and requires no other attention till harvest, when it is threshed and sacked on the ground.

In no part of the State does the grape arrive at rarer perfection. Gravelly lands apparently worthless, and southern exposures on the desolate appearing slopes of the foothills, are the favorite situations for the grape, if irrigation can be practised. Every locality in the valley expresses wine sufficient for its own neighborhood, though ignorance of the proper treatment of the juice of the grape has prevented any considerable export of the immature article produced. The wines of the mountains are sweet and strong, and possess a heavier body and finer flavor. Every farmer who indulges in its use expects to make his own wine in this valley. For table use grapes of excellent quality are as common and cheaper than wheat, and some varieties of foreign grapes would tempt an anchorite. The vineyard interest in a few years,

it seems probable, will only be secondary to the grain production, and far more profitable.

Fruits of all descriptions attain to rare perfection and monstrous size in the mountain valleys and on the foothills. The plains also produce fruit in abundance. Apples, peaches, pears, nectarines, apricots, plums, quinces, cherries, figs, etc., thrive luxuriantly, apples and pears often attaining to a weight of twenty ounces, and other fruits relatively in the same proportion as to size. The growth of the ligneous fibre is vigorous and rapid, trees reaching a size in two years equivalent to a six years' growth in the Eastern States, and bear in two and three years from planting. In six years many varieties are at their maximum bearing point. Grafted fruits only are cultivated, and are as exquisite in flavor as beautiful and tempting in appearance. In the fall of the year, apples and pears are so common that everybody revels in the toothsome fruits, and they are so cheap as hardly to pay for transporting to market.

The small garden fruits and berries of temperate climes—the blackberry, raspberry, gooseberry and currant—produce exuberantly, and the strawberry plant will bear every month in the year, except February, in the open air. There is no question that the cranberry plant will succeed well on some of the swampy lands of the upper San Joaquin. The system of culture pursued with respect to fruit is that most approved of by enlightened horticulturists everywhere.

Cantaloupes, watermelons, pumpkins, etc., do well in the moist sandy river bottoms, the watermelon, particularly, arriving at a state of perfection.

Kitchen vegetables and garden sauce, in all their extensive range, and of the most succulent character and mammoth size, may be raised the year round with proper irrigation. Peas, onions, lettuce, radishes, etc., raised in the open air, are common in the markets in February. Cabbages produce enormous solid heads, and are only taken from the ground when needed for use.

In the rich bottom lands of Tulare Lake, Indian corn grows very luxuriantly, and produces equally well with bottom lands of the West.

A third cultivation, which seems likely to give origin to an important manufacturing industry, is raising sugar beets for their saccharine qualities. The sugar beet, in a deep, rich loamy soil, attains a weight of from ten to one hundred pounds, and an average crop reaches twenty tons to the acre. The labor of cultivation is light, and the climate offers peculiar inducements for engagement in this industry. The beet root will net seven per cent. of its gross weight of sugar, which at a moderate calculation will realize \$300 per acre for profit, and expenses of cultivation and manufacture. Germany and France supply the home demand for sugar from the saccharine matter of the beet, and those countries do not favor this industry when brought in comparison with San Joaquin Valley. Observation and analysis have determined the value of this root crop, and it is not unlikely a manufactory will soon be established to demonstrate the feasibility of making beet root sugar in California.

Hemp and flax are indigenous to Southern California, and on the moist, loamy bottom lands thrive luxuriantly. The textile fibre of these plants appears lacking in strength, and flax is only, but quite extensively, cultivated for the oleaginous properties of the seed. The castor bean is also raised in considerable quantities for its oil.

The soil and climate of this valley particularly favor the cultivation of the hop plant, and in San Joaquin county many acres have been planted with this vine, where it produces amazingly. The absence of moisture during the growing season secures the hop from the mildew so fatal in other countries, and the crop averages 600 pounds to the acre. The active principle, lupulin, is a more pleasant and stronger bitter than foreign hops possess, resulting, do doubt, from the ability to cure the strobiles in the open air.

The tea plant easily becomes acclimated in the arable regions of the upper foothills, grows to be a beautiful shrub, and with proper knowledge may become, through the instrumentality of cheap Chinese labor, an important staple of the country. Large quantities of Japanese seeds have been introduced; and the thorough cultivation of the tea plant will be tested in every portion of the State.

There seems no more promising pursuit for man, woman and child, in the San Joaquin Valley, than the culture of the white mulberry tree and the rearing of silkworms upon its leaves. The mulberry tree thrives luxuriantly, and the climate is peculiarly favorable to the propagation and nurture of the silkworm, and the production of the finest qualities of silk cocoons. The absence of all disturbing electrical phenomena, the mildness and equableness of the climate, and the freedom from moisture of the mulberry leaf, so destructive to this sensitive creature, warrant the statement that this is a superior, and probably the best silkworming country on the globe. The worms are healthy, the feed very succulent, the silk of fine texture, and the cocoons unusually large. In the season of feeding and spinning, a woman or child can attend to the worm, and what more particularly recommends the pursuit, is the small amount of capital required to commence upon. The product is always in demand and very valuable, and can be secured here with less labor and less cost than in Italy or France. The pursuit already engages the attention of many ladies, who find it a delightful employment and recreation. The feeding of the worms is through with in a few months, and with common care a failure is not possible, as often happens in purely agricultural pursuits. A silk factory has been established near San Francisco, and domestic silk will soon be turned out, entirely of California production.

The honey bee has been acclimated, and in favorable locations lays up plentiful stores; but the

arid plains for four months of the latter part of the year—flowerless and shrubless—throw it back upon hoarded savings, and unless well situated for bee pasturage, the pursuit is not remunerative. In the timbered region of King's River and Tulare Lake the pursuit is followed with moderate success. The Italian honey bee has been introduced, and has multiplied very rapidly. The bee swarms several times during the summer, and many thousands of swarms have been lost and become wild, taking up their habitations in trees or caverned rocks.

Wherever natural pasturage exists, sheep husbandry is pursued with compounding profits, and the prolificness of the animals is astonishing. Sheep are herded during the day, and driven into corrals or pens at night. The native stock has been much improved by intermixtures with Merinos, Cotswolds, and other fine foreign breeds. The fleeces are heavy, and the animals singularly free from the usual diseases incident to their species.

Improved breeds of English cattle have been imported, and their progeny has been scattered throughout the valley. The increase of cattle is very rapid, consequent upon the early maturity and great prolificness of cows. Neither cattle or sheep require shelter from the inclemencies of the season.

Great attention has been paid to the improvement of the mustang, or native breed of horses, by the introduction of Thoroughbred, Black Hawk and Clydesdale stock animals.

The Essex and Berkshire breed of hogs are common, and immense numbers are raised in the valley, particularly among the oaks of the foothills, and along the wooded streams and tule swamps of the Tulare Basin. They also thrive on the scattered grain of the wheat fields into which they are driven after harvest.

Poultry—geese, ducks, turkeys, etc.—are raised in immense numbers, and form a lucrative branch of domestic produce.

Butter and cheese making are not very extensively engaged in, but can be carried on successfully, and the products are of excellent quality.

THE SOUTHERN COUNTIES.

The following important and instructive letter written by the U. S. Commissioner of the General Land Office, Washington, D. C., in response to enquiries made by the American Consul at Rotterdam, on behalf of a number of inhabitants of that country, who wish to emigrate to California, will be of great interest to the general reader:

UNITED STATES OF AMERICA,
DEPARTMENT OF THE INTERIOR,
GENERAL LAND OFFICE, May 13, 1869.

ALBERT RHODES, *United States Consul, Rotterdam, Holland*—DEAR SIR: In reply to your letter of the 7th ult., requesting information in regard to public lands in Southern California, especially in the neighborhood of Los Angeles, I have to state that the valuable lands in the southern portion of that region, in the counties of San Diego, Los Angeles, San Bernardino, Kern, Santa Barbara, and San Luis Obispo, are to a considerable extent held under Mexican grants, many of which have been confirmed by the United States since we have succeeded to the sovereignty of the country. The counties of San Luis Obispo and Kern may form an exception to this statement, as Government land of excellent quality exists in each; but so much has been recently entered under the pre-emption and homestead laws, and located with college scrip, and still continues to be taken, in consequence of a numerous emigration to Southern California within the past two years, that it would be hazardous to undertake to specify the quantity of public land at present subject to entry, as the next returns from the local officers may show the amount considerably diminished. There is however an abundance of unoccupied land of the best quality in each of the counties named, which, whether belonging to the Government or in the hands of private owners, may be readily obtained at very moderate prices, generally varying from \$1 to \$5 and upwards per acre, according to value.

MEXICAN LANDS, GRANTS, TITLES, ETC.

Lands in the hands of persons claiming under Mexican grants confirmed by the United States, are perfect as to title. Lands claimed under grants not so confirmed, seldom rate at a high figure; and should the title subsequently fail, and the lands be declared a part of the public domain, the laws of the United States extend to parties in possession under conveyance from former grantees, a pre-emption right to enter the land so occupied at the minimum price of \$1.25 per acre, so that in either event the settler will obtain the land at a very low price. Indeed, at the present day no apprehension need be felt about the title of lands in California, as most of the Mexican grants, valid or invalid, have passed through the ordeal of judicial investigation, and have either been confirmed or the lands claimed, declared part of the public domain; and even if an occasional claim should be met with not acted upon, the Acts of Congress make such liberal provision in favor of *bona fide* settlers that no great injury can result in the event of such claim proving invalid.

An emigrant from Europe, entirely unacquainted with the land system of the United States, or the nature of titles in this country, and the mode of recording them, might be liable to make a bad bargain, unless he fully informed himself. But there are abundant opportunities of ascertaining the condition of the title of every tract of land, and a person of ordinary prudence need not go amiss.

GOVERNMENT LANDS, ETC.

Government lands in California may be taken under the pre-emption or homestead laws, the entries being effected in the manner pointed out in

the accompanying circular from this office, dated March 10th, 1869. In the southern part of the State these lands are mostly located to the eastward from the Coast Mountains; but there are, nevertheless, in the western portion of each of the above named counties, small quantities of public land not yet occupied, which may be entered at the District Land Office at San Francisco, excepting lands in Kern County, which must be entered at Visalia, in Tulare County. The localities of the different places mentioned may be readily understood by inspecting the accompanying map of that State; an examination of which will also show the localities of private grants confirmed at the date of the map, the names of which, with corresponding numerals, are placed in the margin.

GOOD LANDS.

It will be observed that the good lands of Southern California are found on the Pacific, in the valleys and on the foothills of the Coast Mountains, extending inland from twenty-five to seventy-five miles, embracing in area susceptible to cultivation and admirably adapted to horticulture, equal in extent to the State of Massachusetts.

CLIMATE, PRODUCTIONS, ETC.

The climate of these valleys, some little distance from the coast, is not surpassed in any portion of the world; the intense heat experienced in the arid plains further to the east being modified here by an altitude of several thousand feet above the level of the ocean. Numerous streams of water flow through the valleys—many of them permanent—furnishing the means of irrigating large bodies of land. The grape vine flourishes here luxuriantly; more than 6,000 being cultivated in Los Angeles County alone, yielding one and a half million gallons of wine, and more than one hundred thousand gallons of brandy, besides large quantities of choice grapes for the San Francisco market.

The grape attains vigorous growth in almost every variety of soil, is remarkably free from disease, and requires no irrigation. It flourishes as well in the foothills and on the sides of the mountains as in the valleys, and produces a stock strong enough to dispense with the necessity of stakes, thus greatly reducing the amount of labor required in a vineyard. A vine is now growing in Santa Barbara County twelve inches in diameter four feet from the ground. At six feet from the ground the stem is divided, the branches extending in every direction, covering an area of 10,000 square feet, and producing annually 12,000 pounds of grapes, in bunches from fifteen to eighteen inches in length, averaging from six to seven pounds each. This vine is of the old Mission grape, and was planted forty-three years ago.

But the soil and climate of these valleys are equally well adapted to the growth of the orange, lemon, lime, citron, fig, walnut, olive, banana, almond, filbert, and currant; and wheat, barley, corn, potatoes, cotton, tobacco, and sugar-cane thrive well. In an orange grove of 2,000 trees, near Los Angeles, the annual crop averages 1,500 oranges to each tree, some of the trees producing as many as 4,000 each. The sides and summits of the mountains contain an abundance of pine, cedar, hemlock, maple and oak; and deposits of gold, silver, copper, tin, marble, alabaster, asphaltum, petroleum, sulphur, salt and coal are numerous.

EXTENT, CULTIVATION.

Of the 4,000,000 or 5,000,000 acres in Southern California adapted to the vine and the mulberry tree, and a great variety of semi-tropical fruits, not much over 100,000 acres are thus cultivated—probably not that of quantity; and although that region is capable of accommodating and comfortably supporting a population of 1,500,000, its present population falls short of 40,000.

WINE AND BRANDY—UNOCCUPIED LANDS—A SUCCESSFUL COLONY.

Hundreds of thousands of acres of the finest lands, blest with a climate equal to that of the fairest portions of Italy, are held in extensive tracts under Mexican grants, and are either entirely unoccupied or devoted to grazing; the proprietors, however, manifesting a willingness to subdivide and sell their claims as rapidly as the increase of settlers creates a demand for the same. As an illustration of what may be accomplished by an enterprising colony of settlers, the village of Anaheim, in Los Angeles County, may be referred to. In the summer of 1857 a company of Germans acquainted with grape culture, bought 1,295 acres of land in the valley of the Santa Anna river at \$2 per acre, dividing it into fifty rectangular lots, of twenty acres each, with streets between them, and subdividing the residue into sixty town lots—one for each of the proprietors, and ten for public purposes. The lots were all fenced with willows, sycamore, and poplars, and about ten acres of each planted with vines. At present there are over 1,000,000 vines growing in this village—most of which are in bearing—already producing annually over 250,000 gallons of wine and some 20,000 gallons of brandy. Of the various kinds of fruit trees there are more than 10,000. Every one of the fifty lots contains a comfortable homestead, and the village has a population of about 400, with a good public school, several stores, and a post office in the town. Each of these lots is worth at the present time fully \$10,000, and is continually increasing in value. The history of Anaheim demonstrates the advantage of settlements by colonies. Had each of the original fifty settlers of the village located by himself, cut off from the encouraging sympathy and mutual counsel of congenial neighbors, it is doubtful whether success would have crowned the efforts of one-fourth of their number; but adopting the colony plan, they have in twelve years advanced to a situation not only of comfort, but of comparative wealth.

There are many opportunities, not only in the county of Los Angeles, but in each of the others named above, and, in fact, in nearly every county in California, to repeat the experiment of the Anaheim settlement, under circumstances even more favorable than existed in that case.

Since 1857 the character of California as one of the best wine-producing countries in the world has been fully established; many foreign varieties of the grape have been tested; and much that twelve years ago rested upon uncertainties has been established by repeated experiments; in addition to which the great continental railway from the Atlantic to the Pacific has been completed, opening a market for the products of the California vineyards.

All these advantages, that did not exist when Anaheim was founded, will render the trials of similar colonies much less severe.

Very respectfully, your obedient servant,
Jos. S. Wilson, Commissioner.

SWAMP AND TULE LANDS.

Among all the agricultural lands of California, there are none so rich and productive as the swamp lands. The State contains 5,000,000 acres of swamp and overflowed tule land, which only needs reclamation by means of ditches and levees, to render it the most fertile soil in the world.

The reclamation of swamp and overflowed land is not, as many suppose, a problem to be solved. The splendid sugar plantations of the lower Mississippi, and the rice fields of Georgia and South Carolina, fully attest what labor and engineering skill have accomplished in our own country, in transforming malarious swamps to useful fertility and pleasant homes.

The value of land that could be cheaply and effectually irrigated, and land enriched by overflow, as on the Ganges and Nile, has been appreciated for many centuries by the husbandry of all civilized nations. Sacred history informs us that the Egyptian granaries, insured by irrigation, were overflowing with corn when their neighbors were famishing for bread. Sesostris, who lived sixteen centuries before the Christian era, added much to the wealth of his people by constructing canals for that purpose. Italy, the "mother of the arts," has the most perfect system of irrigation in all Europe. The great canal of the Ticino, in Lombardy, was constructed in the Twelfth century, and, to quote from a modern writer, "it has carried a volume of water equal to 1,800 cubic feet per second for more than 600 years. This great mass of water has been spread over the surface of the country through a thousand channels, stimulating the productiveness to such an extent as to make the country through which it passes one of the richest and most densely populated which the world has ever seen." Since the famine in India, over 11,000,000 acres of malarious lands have been subjugated by drainage and irrigation, and now sustain a population of 500 to the square mile. Holland has wrested from the ocean the most valuable portion of her kingdom, and is now planning a gigantic scheme to encroach on the waters of the raging Zuyder Zee. The old Romans drained the marshes of the Tiber, "and fed the armies that ruled the world." Over one-half the best meadow lands in England were not many years since a valueless swamp.

The splendid success of the reclamation of Sherman Island has stimulated similar enterprises. The Ride Land Reclamation Company, recently organized, with a nominal capital of \$12,000,000, has purchased 120,000 acres of the same character and value as the land on Sherman Island.

Although there are several million acres of swamp and overflowed land, generally designated "tule," in California, there is not to exceed 200,000 acres of what can properly be termed *fresh water tide lands*, as favorably located, and as valuable when reclaimed, as Sherman or Twitchell Island. By drawing a line on the map across the San Joaquin at Stockton, and five or six miles above the head of Steamboat Slough, on the Sacramento River, and just below Sherman Island, where both rivers meet, and the within area will embrace all the land of that character in the State.

By the action of the tides, which rise and fall from four to six feet every twelve hours, the water is kept pure, and self-acting tide-gates can be used for drainage or irrigation, at pleasure. The trade winds during the summer months are pleasantly modified, but always invigorating; and these beautiful islands, with the charm of perpetual verdure, are exempt from fevers and malarious diseases generally, and are destined in a few years to be the most densely populated and valuable agricultural lands on the Pacific Coast. Being free from roots or stones, and generally on a uniform plain, they are admirably adapted for steam cultivation. The Tide Land Reclamation Company propose at an early day to use the steam plow, with stationary engines. Over 3,000 of these plows are now in use in England, and the old Viceroys of Egypt imported 200 of them seven years since, to his rice fields on the Nile, where he annually cultivates 800,000 acres.

The character of the soil is peculiarly adapted for levees, and should they be covered by water during an extraordinary flood (as in '61 and '62), little or no damage would be sustained. Within a few years our markets will be supplied from these fresh water tide lands with fine clover and timothy hay, which can be placed in San Francisco, owing to advantage of cheap water transportation, and three or four crops yearly, at greatly reduced rates from what is generally paid for the poor article of straw hay that we are now compelled to use.

The question is, what products from these lands when reclaimed, will be the most profitable? Will it be wheat, which matures in one hundred days, and yields from sixty to eighty bushels per acre? Barley, that in less time reaches one hundred

bushels per acre? or timothy, or clover, that will crop eight to ten tons of hay annually? Vegetables and fruits grow in such abundance that the market might be overstocked. It is believed by those familiar with the subject, that rice would find it a congenial soil. Rice, madder, sugarcane and cotton will probably be tested in a small way next year. As pasturage, either for stock or dairy purposes, these lands have unequalled advantages.

Immunity against drouth, healthful and pleasant climate, inexhaustible productive powers of soil, and cheap transportation, are sufficient inducements to secure their reclamation, and in a few years they will be pointed to with pride, as constituting a great portion of the agricultural wealth of the State.

Chapter V.

MANUFACTURING.

General Remarks—Woolen Mills—Boots and Shoes—Sugar Refining—Lumber and Shingles—Flouring Mills—Manufactures in San Francisco—Car and Carriage Building.

GENERAL REMARKS.

Second to the development of agricultural resources in the chain of civilization is the encouragement of home manufactures and such other industries as grow out of the wants of the people. Destiny has marked out for California a high position. In a few years—perhaps during the lifetime of many who read this—she will be the great commercial empire of the Pacific. Home manufactures are the source of England's strength and wealth, the pride and cause of wealth in our Eastern States, and of the power of recuperation which has enabled Prussia, Germany and France to recover from the devastating effects of many a hard fought battle.

There is an abundance of valuable water power in the State which are long will be harnessed in and turned to account. The principal points at which water power is situated, are the falls of Merced river, Merced county; Knight's Ferry, on the Stanislaus river, Stanislaus county; and at Folsom, on the American river, Sacramento county.

The leading interest of the State until a few years back was that of mining, and the high rates of wages then prevailing precluded the possibility of competing with goods of foreign manufacture; consequently everything was imported, much to the detriment and impoverishment of the State. Now, however, that the great harvest days of gold hunting are over, and the accumulation of colossal fortunes by easy means has ceased, wages and the rates of interest for money have fallen sufficiently low to warrant the introduction of capital into, and the encouragement of manufactures; and it is gratifying to observe the steady increase in that direction. California is peculiarly fitted, on account of its internal resources and geographical position, not only to manufacture everything she requires for home consumption, but also to become a large exporter of manufactured goods to Australia, New Zealand, China and Japan; and the day is not far distant when the dreams of such an event will be realized. Capital for manufacturing purposes is being rapidly accumulated and invested in enterprises of magnitude.

WOOLEN MILLS, CLOTHS AND BLANKETS.

The manufacture of woolen is one of the most prominent branches of industry in the State. There are five mills in active operation—three at San Francisco, one at Sacramento, and one at Marysville. The aggregate quantity of wool used by the five mills during the years 1868-9 was nearly 4,000,000 pounds.

Two mills in San Francisco, viz., the Mission and Pacific (Knitting), have been in successful operation for some years. Returns made by the County Assessor show that in 1868-9 those mills used up 3,250,000 pounds of wool. Recently their respective interests consolidated, and the business is now carried on under the supervision of Donald McLellan, Esq., founder of the Mission Woolen Mills (one of the two in question).

The enterprising spirit of Mr. McLellan has suggested many improvements, and the inauguration of a more extended field of operations. With that view a large tract of land contiguous to the city has been purchased, and he will erect three buildings of gigantic proportions to carry out his plans.

The new mills will turn out the finest description of beaver cloths, tweeds, and cloakings; blankets of every description, horse and sluing blankets, kerseys, carriage robes, etc.; ingrain, three ply, fine and superfine carpets (which have hitherto been imported from the Atlantic States), besides every description of knit goods. In addition also, there will be a department devoted to the manufacture of all classes of men and boys' ready made woolen clothing. Some idea of the magnitude of the establishment contemplated may be formed from the fact that it will give employment to upwards of 1,200 persons.

BOOTS AND SHOES.

Of the boot and shoe factories, that of Messrs. Buckingham & Hecht, of San Francisco, is the most extensive. Their building is situated on Market street, opposite the San José Railroad Depot; it is 60 by 120 feet, two stories high. It is a model for compactness and perfect adaptability for the purposes of the business.

This firm employs 170 men and 35 women; it produces annually 130,000 pairs of boots and shoes, embracing almost every variety of style known to the trade. They consume yearly 18,500 sides of sole, and 3,000 sides of wax upper leather, 6,000 wax kip, 12,000 calf, and 31,000 sheepskins,

all of California manufacture, in addition to which they use of imported articles, 9,000 French calf, 8,000 kid and goat skins, 15,000 yards of lastings, and 14,000 yards of Lomene, besides other minor items such as silks, thread nails, etc., to the value of \$10,000 per annum.

Their disbursements for labor amount to \$170,000 yearly, and they give sustenance to 1,200 persons, thus practically and forcibly showing the great importance of home industry.

SUGAR REFINING.

This branch of manufactures is carried on very extensively, but its ramifications are at present confined to San Francisco. During the year 1869 there were used 25,160,000 pounds of raw sugar, and 20,254,000 pounds of refined sugar were produced from it, besides the usual proportion of syrup.

LUMBER AND SHINGLES.

The sawing of lumber and manufacture of shingles, and the business growing out of it, employs more capital than any other branch of manufactures. The principal lumber districts which supplies the coast and adjacent counties, are in the counties of Humboldt, Mendocino and Santa Cruz. Last year there was turned out in the State 267,459,885 feet of lumber, and 67,707,000 shingles. Besides the above named, the business of lumbering is carried on to a considerable extent in the counties of Butte, Placer, Nevada, and San Bernardino.

FLOURING MILLS.

The grinding of wheat and corn is not confined to any particular county, but is scattered all over the State, and is very profitable. The returns of last year show that 1,871,808 barrels of flour and 133,004 bushels of corn meal were turned out from various grist mills in the State.

MANUFACTURES IN SAN FRANCISCO.

Hitherto the principal portion of the manufacturing interests of California have been mostly confined to San Francisco.

There is no place in the United States where the intelligent investment of money in manufactures promises such fine results to its owners and to the community at large. San Francisco is the natural supply point of the Pacific and Rocky Mountain States and Territories, and, for many articles of the foreign countries on the Northern and Southern coasts. She reaches, also, to the mid-ocean islands, Australia, Japan and China. To the extent that she manufactures herself the articles needed to meet her growing trade with all these regions, she will increase the profits of that trade, while multiplying the avenues of home employment and adding to her resources for the support of a large population. A mercantile house that imports from the East or from Europe a certain line of goods, creates nothing, and employs only a few clerks and porters. A manufacturing house, which makes the same goods here, creates a new property, employs hundreds of people more or less directly, and stimulates a dozen different trades, while retaining capital here that would else go abroad. In this way the manufacturer creates and anchors wealth, and there is an expansive quality to his enterprise which touches every interest in society.

In proportion as the city becomes more and more the maker of what she sells, she will enrich herself and the State beyond all that the mines of gold and silver can do. These very mines, indeed, are more profitable by reason of home manufactures, meeting special wants in the most direct and intelligent manner, and keeping their metallic yield among those who have helped to extract it. The foundries and machine shops of San Francisco have enabled miners, especially in quartz, to work with more economy, system and success. The very rapid development of the silver mines of Nevada, leading to such important discoveries elsewhere, would not have been possible without their help, isolated as the State was before the Pacific Railroad opened.

Circumstances like these, proving the importance and profit of manufactures, should encourage capital to invest more in that direction. The great fortunes of the past two decades have been made in commercial, mining and real estate operations. Some of the greater fortunes of the future are to come from internal improvements and manufactures. Those who enter the field now, when competition is least, will lay the foundation for the largest gains, and in addition to having enriched themselves, will be justly regarded as public benefactors. When a new manufacture appeals for moneyed help, it should not appeal in vain. It will, nine times out of ten, if prudently conducted, be found less precarious than most mercantile pursuits. Then the field for manufactures is so much wider and more varied here than elsewhere in the Union. The soil and climate of California favor the production of many staples for manufacture which elsewhere have to be imported, and production and manufacturing may often be profitably united—as in the case of beet sugar, silk, vegetable oils, tobacco. It will be strange if there is not sagacity and enterprise enough in San Francisco to avail of advantages so potent, and which may be used to convert the city, in a few years, into a great manufacturing centre.

The Report of the Assessor for the San Francisco District, for the years 1868-9, is as follows:

Box MANUFACTORIES.....	5
Men employed.....	169
Lumber used (pine, fir and spruce), ft. 5,600,000	
Spanish cedar used.....	160,000
Horse power of engines.....	90
BAASS FOUNDRIES.....	5
Men employed.....	85
Value of manufactures.....	\$143,000

BOOT AND SHOE MANUFACTORIES.....	8
Men employed.....	192
Value of manufactures.....	\$160,000
BREWERIES.....	21
Men employed.....	153
Beer made, barrels.....	120,300
Monthly capacity, barrels.....	9,750
BROOM AND WOODEN WARE MANUFACTORIES.....	7
Men employed.....	66

CAR AND CARRIAGE BUILDING.

This branch of manufacturing industry is being followed up with so much vigor and resoluteness of purpose as to claim for it more than ordinary observation.

The first establishment in importance is the Kimball Car and Manufacturing Company, corner of Fourth and Bryant streets. It covers nearly, if not wholly, an entire block of ground. The smiths' shop is 250 feet in length, and has 18 forges in active operation, supplied with air by one of Root's patent blowers run by steam power. In it all the iron gear for wagons, ears and carriages is turned out. There are also turning lathes and an immense trip hammer for shaping the iron into the forms required. The lathes, hammers and other machinery are driven by a fifty-horse power engine, which also supplies power for all the machinery in other parts of the building. Adjoining the machine shop is one for wood turning, planing, sawing, moulding, boxing and mortising. The car shop is of proportionate magnitude, and in it all descriptions of railroad and street cars are manufactured, which are fully equal to any of Eastern manufacture, from whence all were imported until the Kimball Manufacturing Company embarked in this branch of business. As the price of labor and interest for money lessen in value, admitting of fair competition with our Eastern neighbors, the entire rolling stock of our railroads will be furnished at home, giving thereby additional encouragement to home industries. The repository over the machine shop is 275 feet long and 50 feet wide. It is filled with every description of vehicle from the elegant carriage and barouche to the feather-weight trotting wagon. Besides the above named, there are the Woodworkers' Shop, the Thorough-brace Shop, and the Trimmers' Shop, each of which is replete with all the modern improvements which science has developed.

Chapter VI. COUNTIES.

The counties of California are generally classified as the Southern Counties, Coast Counties, Northern Counties, Mountain Counties and Valley Counties.

SOUTHERN COUNTIES.

The southern counties of California comprise San Diego, San Bernardino, Los Angeles, Santa Barbara, San Luis Obispo, and Kern Counties, which are known collectively as Southern California.

SAN DIEGO COUNTY.

San Diego comprises the most southern portion of the State. It is 100 miles in length, and 150 miles in breadth at its most southern extremity, which separates it from Lower California. It contains 8,500,000 acres, of which the Colorado Desert covers 2,500,000 acres, about 4,000,000 acres are mountains and cañons, and the balance 2,000,000 acres, are level plains and valleys suitable for farming or grazing. Most of the land is yet unoccupied. Some discoveries of gold and silver have recently been made which has drawn a large crowd of prospectors. The developments hitherto do not indicate the presence of precious metals to a very considerable extent. In consequence of a strong belief that the port of San Diego will be the terminus of the projected Memphis and El Paso Railroad, quite a lively town has sprung up called New San Diego, the population is estimated to be 2,000 and upwards. The County Seat is San Diego, or as it is now called, Old San Diego, is situated about two miles north of the new town, and contains between 300 and 400 inhabitants. The old town was established by the Missionaries in 1769. The county is very thinly populated, and consequently its resources are undeveloped; but public attention having been directed thither of late, many large tracts of land have been taken up, and there is quite a lively competition among real estate operators. The harbor of San Diego is second in size to that of San Francisco, and is equally secure, being perfectly land-locked. Vessels of any size can enter and ride safely at anchor. San Francisco and San Diego harbors are really the only two in California; all the others along the coast partake rather of the character of roadsteads. The climate is delightful, and particularly beneficial to invalids suffering from pulmonary diseases.

The returns of the County Assessor for the years 1868-9, were as follows:

Ind. Corn, bush.....	60,000	Grape vines.....	80,000
Wheat, bush.....	45,000	Neat Cattle.....	22,063
Barley, bush.....	75,000	Sheep.....	16,800
Wool, lbs.....	68,000		

The town of San Diego is 500 miles from San Francisco, and is reached by stage or by steamers, which last run weekly. The fare is \$25 cabin and \$15 steerage. Fort Yuma, a military post, is situated at the extreme southeast corner of the county on the Colorado river, at the north of the Gila river.

SAN BERNARDINO COUNTY.

San Bernardino is the largest county in the State, containing over 10,000,000 acres, three-fourths of which is unfit for cultivation, containing desert valleys and volcanic rocks. The land still open for pre-emption is being taken up so rapidly at the present time, that it is impossible to make any record of the quantity still unsettled. The immigrant in want of a farm, will find no difficulty in purchasing from the owners of the numerous large ranchos in this county, rich agricultural land at from \$1 to \$2 per acre. The whole population of the county does not at present exceed 6,000.

In this county, which is admirably suited to the raising of the grape, is the famous Cucamongo Vineyard, situated about 45 miles east from Los Angeles. It contains 160,000 vines, some of which are the oldest in the State. These vines grow at the foot of volcanic hills, in a mixed black soil of rocks and gravel. The vineyard produces port, angelica, and a white wine which bears a resemblance to Madeira. This wine is the most matured and least crude of any California wine, and after it has attained the age of ten years, is equal to the best Madeira. This superiority is partly due to the nature of the soil and climate, but chiefly, we are inclined to think, to the great age of the vine, young vines as a rule make raw, crude wine which no age will soften, while those which have by age attained substantial stems, make a wine more resembling the old wines of Europe.

In the mountains north of San Bernardino, are fine bodies of timber, and several mills in active operation. These forests in time must supply much of the material needed on a Southern Pacific Railroad. Adjoining the Cucamongo Ranch large bodies of land has recently been entered, and are being devoted to the growth of semi-tropical fruit by two parties, one the Eden Dale Company, and the other by the Cucamongo Valley Land Company.

Returns of County Assessor for 1868-9:

Barley, bush.....	150,000	Wine, gals.....	74,500
Ind. Corn, bush.....	58,080	Braudy, gals.....	10,500
Grape vines.....	425,000	Population.....	5,200

The county seat of San Bernardino County is San Bernardino, distant from San Francisco 454 miles. The fare by steamer to San Pedro, rail to Los Angeles, and stage to San Bernardino is \$30.

LOS ANGELES COUNTY.

The most important of the southern counties of California is Los Angeles. It comprises nearly 2,000,000 acres, nearly two-thirds of which are fit for cultivation or grazing purposes. Much of the land now used simply for grazing, would, if brought into cultivation, yield large crops. The products of this county have been so fully enumerated in Commissioner Wilson's letter, that further reference to them is needless. The price of land ranges from \$1 to \$100 per acre. There are still large tracts of land in the possession of Spanish settlers which can be bought at the former figure. In July last the San Fernando Homestead Association bought from Pio Pico about 16,000 acres of land, well adapted for agricultural purposes, for \$180,000. This is one-half of the San Fernando Ranch, situated about 15 miles northeast of Los Angeles. Los Angeles is a perfect paradise for farmers, and when it is connected with San Francisco by railroad, every acre will be brought under cultivation. A railroad connects Los Angeles with Wilmington, a seaport in the harbor of San Pedro, distant 21 miles.

The production of grapes in Los Angeles County is very large, 3,840,000 vines being grown within its limits. From the product of these vines 1,111,200 gallons of wine and 85,800 gallons of brandy were made in 1868-9.

SEMI-TROPICAL FRUITS—ENTERPRISES IN LOS ANGELES.

We extract the following from the San Francisco Bulletin at April 27th, 1870:

The southern half of California is capable of producing enough oranges, lemons, limes, olives, and other specimens of the semi-tropical fruits to supply the wants of all the States of the Union. Before many years the oranges of Los Angeles will constitute a large item in the Eastern freight list of the Pacific Railroad. Great profits have been realized by raising these fruits to supply the San Francisco market, and large tracts of land are being rapidly brought under cultivation for the purpose of increasing their production. In addition to the fruits above named, Los Angeles produces every season, and sends to this city, large quantities of grapes, English walnuts, Italian chestnuts, peanuts, almonds, etc. The orange trees are in bearing nearly all the year, and the yield per acre is very large. At the Lake Vineyard, owned by B. C. Wilson, 600 trees bore on an average 1,200 oranges each. The trees occupied ten acres, and his crop of oranges brought \$21,000 last year. At the Mission San Gabriel are 80 trees which are 60 years old, and which bear 3,000 oranges per year. The product of the Wolfskill Ranch at Los Angeles City, amounted last season to \$14,000, the orchard covering about eight acres. At the mission above named there is a tree 80 years old, 5 feet six inches in circumference, which bore last year 5,000 oranges.

The culture of the grape and manufacture of wine and raisins, also becomes more and more important every year in the southern counties, as well as in other portions of the State. Portions of Los Angeles County are rapidly filling with people interested in this branch of industry. The valley comprises about 800,000 acres, but in 1869 less than 38,000 acres were under cultivation. Within a few months several companies have been formed in this city for the purpose of securing and cultivating large tracts of the land. Among these are the San Pascual Plantation, Eden Dale Company,

the Cocomongo Land Association, and others. Their lands are within about 40 miles of Los Angeles, and some of them only a few miles distant.

Among the principal vine growers may be mentioned the Hon. B. D. Wilson, Sansevain, M. Keller, L. J. Rose, Kobler & Frohling.

The Hon. B. D. Wilson's vineyards being the most extensive, comprising in the neighborhood of 500 acres of bearing vines, the vineyards are at present leased to the Lake Vineyard Wine Co., of San Francisco and New York, for a term of years, and should nothing untoward occur the quantity of wine made will exceed 150,000 gallons; Sansevain is justly celebrated for its Cocomongo wine.

The United Anaheim Wine Growers' Association at Anaheim, in Los Angeles County, is very extensive in its manufacture of almost every description of wine, both sparkling and still, and has a large establishment there, as well as having a depot as large or larger than any of the others in San Francisco.

Mr. Wilson has a very fine orchard of orange trees on his ranch, which brings him a large yearly return.

Returns of County Assessor for 1868-9.

Grape vines.....	3,840,000	Barley, bush.....	203,200
Orange trees.....	25,000	Ind. Corn, bush.....	281,500
Wine, gals.....	1,111,200	Castor Beans, bhs.....	90,000
Brandy, gals.....	85,800	Potatoes, bush.....	89,300
Honey, lbs.....	87,504	Population.....	14,600
Sheep.....	209,000		

The county seat of Los Angeles County is the city of Los Angeles, which has a population of 7,000 inhabitants. It can be reached by steamer to San Pedro, and railroad to Los Angeles. The fare is \$23. Another route is by railroad from San Francisco to Gilroy, fare \$4, and stage from thence, fare \$25—\$29 in all. Los Angeles connects with stages for San Diego, Fort Yuma, Tucson, San Bernardino, La Paz and Clear Lake.

SANTA BARBARA COUNTY.

Santa Barbara county contains about 1,500,000 acres, one-half of which are unfit for agricultural purposes, but are admirably adapted for sheep or cattle. This is one of the most important grazing counties in the State; cattle, sheep, horses and hogs are raised by thousands. Land can be obtained at from \$1 to \$5 per acre.

Returns of County Assessor for 1868-9.

Wool, lbs.....	965,835	Neat cattle.....	11,094
Barley, lbs.....	180,000	Horses.....	4,558
Cheese, lbs.....	88,119	Grape vines.....	350,000
Beans, lbs.....	40,000	Population.....	8,900
Sheep.....	193,167		

The county seat of Santa Barbara county is Santa Barbara, which contains 1,600 inhabitants. It is 280 miles from San Francisco, and can be reached by steamer, which runs weekly. The fare is \$15. Those who prefer land travel can take the railroad to Gilroy (fare \$41), and proceed thence by stage to Santa Barbara. The fare is \$10.

SAN LUIS OBISPO COUNTY.

San Luis Obispo is bounded on the north by Monterey; on the East by Kern; on the south by Santa Barbara county, and on the west by the Pacific Ocean. It contains about 1,500,000 acres, nearly 1,000,000 acres of which is mountainous, and fit only for grazing. The land adapted to agricultural purposes raises grain and fruit in abundance. Land is cheap in this county.

Returns of County Assessor for 1868-9.

Wool, lbs.....	580,230	Sheep.....	83,000
Cheese, lbs.....	221,010	Neat Cattle.....	14,734
Indian corn, lbs.....	37,350	Horses.....	1,998
Beans.....	20,000	Population.....	6,440

San Luis Obispo is the county seat of San Luis Obispo county, and contains 1,000 inhabitants. It is 209 miles from San Francisco, from which place a steamer runs three times a month. The fare is \$15. It can also be reached by taking the railroad to Gilroy, and from thence the stage fare is \$17. San Luis Obispo connects by stage with San Simeon.

KERN COUNTY.

Kern county comprises about 1,500,000 acres, nearly one-half of which is adapted to agricultural and grazing purposes. It abounds in fine timber, is well watered by streams which flow from the mountains, and is destined to become one of the best agricultural counties in the State. Its progress has hitherto been checked for the want of roads, but lately this has been supplied, and communication with a market has been opened. Within a short time a railroad will traverse the whole length of the county. The soil is well adapted to the culture of wheat, sixty bushels to the acre being no uncommon crop. Much of the land is suited to the cultivation of cotton, and good crops have been raised. Ere long a flourishing agricultural community will spring up in the heart of the now sparsely inhabited Kern Valley.

Returns of County Assessor for 1868-9.

Wool, lbs.....	299,496	Neat Cattle.....	37,010
Sheep.....	62,874	Population.....	1,406

The county seat of Kern county is Havilah, a town of about 800 inhabitants. It is 359 miles from San Francisco. It is reached by railroad to Gilroy, and thence by stage, the fare by the latter being \$39. From Havilah a line of stage runs to Shermantown, White Pine, distance 423 miles; Lareland, 40 miles; Soldiers' Wells, 70; Little Lake, 100; Big Lake, 120; and as far as Duckwater—a distance of 407 miles.

COAST COUNTIES.

The coast counties comprise Monterey, Santa

Cruz, Santa Clara, San Mateo, San Francisco, Alameda, Contra Costa, Marin, Sonoma, Napa, Amador, Alpine, Lake, and Mendocino.

MONTEREY COUNTY.

Monterey county is bounded on the south by the Pacific Ocean and San Luis Obispo county; on the east by Fresno and Merced counties; on the west by the Pacific Ocean, and on the north by Santa Clara and Santa Cruz counties. It averages nearly eighty miles in length by fifty miles in width, and contains about 2,500,000 acres. Seven hundred thousand acres are good agricultural land, 97,864 of which were under cultivation in the summer of 1869. The greater portion of the county is devoted to sheep and cattle raising, and still remains in the hands of the Spanish settlers, from whom large tracts suitable for farms can be purchased at from \$1 to \$2 per acre. Wheat can be raised in large quantities in this county, and every variety of fruit and vegetable flourishes.

Returns of County Assessor for 1868-9.

Wheat, lbs.....	1,401,342	Butter, lbs.....	101,800
Barley, lbs.....	943,500	Tobacco, lbs.....	19,300
Beans, lbs.....	61,700	Horses.....	4,646
Potatoes, lbs.....	367,500	Sheep.....	156,503
Wool, lbs.....	625,820	Neat Cattle.....	21,063
Cheese, lbs.....	1,016,200	Population.....	8,478

Monterey is the county seat of Monterey county. It is 100 miles from San Francisco; it can be reached by steamer, or by railroad and stage via Gilroy. The fare is \$7.

SANTA CRUZ COUNTY.

The county of Santa Cruz is more celebrated for its manufactures than for its agricultural products, though it contains some of the richest lands in the State. It comprises 320,000 acres, of which 40,000 acres are the richest bottom lands along the various streams that pass through it, and 50,000 acres of agricultural land which form terraced plateaus caused by the repeated uprisings of the land. Land in this county generally commands a high price—from \$5 to \$50 an acre. There are seven tanneries in Santa Cruz; the California Powder Works are located here, as well as paper mills and other manufactures.

Returns of County Assessor for 1868-9.

Potatoes, lbs.....	85,400	Wrapping Paper, reams	
Butter, lbs.....	64,456		40,000
Gunpowder, lbs.....	400,000	Newspaper, r.....	7,000
Lime, bbls.....	220,000	Lumber, ft.....	19,600,000
Leather.....	\$225,000	Shingles.....	10,000,000
		Population.....	10,000

The county seat of Santa Cruz county is Santa Cruz, distant 76 miles from San Francisco. It is reached by steamer, which runs three times a month—fare \$10, or by railroad to Santa Clara, fare \$1.50, and thence by stage, fare \$3. Santa Cruz connects with stages for Soquel and Watsonville.

SANTA CLARA COUNTY.

This county is bounded on the north by Alameda and San Mateo counties; on the south by Monterey; on the east by Stanislaus, and on the west by Santa Cruz county. It contains nearly 700,000 acres, most of which is in a high state of cultivation, and held at prices which place it beyond the reach of the farmer of small means. The most beautiful farms in the State are to be found here, surrounded by fruit trees of all descriptions, and well irrigated meadows (the water being procured from artesian wells); some of the most picturesque and charming homes in California are in this county. Wheat, hops, grapes and mulberry trees are among the varied products of Santa Clara. Land is as high as from \$300 to \$500 per acre. This county is famous for its medicinal springs, chief among which—as being the most valuable for its medicinal qualities as well as the most palatable—is the New Almaden Vichy Water. This water has attained a high reputation throughout the State, and is very generally recommended by the Faculty. It possesses all the properties of the French Vichy Water, hence its name.

Returns of County Assessor for 1868-9.

Wheat, bbls.....	1,769,247	Strawberry pbs.....	565,000
Flour, bbls.....	227,750	Potatoes, bbs.....	25,630
Hay, tons.....	24,250	Apple Trees.....	825,000
Beets, tons.....	875	Peach Trees.....	80,650
Hops, lbs.....	16,500	Pear Trees.....	65,615
Tobacco, lbs.....	50,000	Plum Trees.....	21,000
Cheese, lbs.....	1,760,820	Cherry Trees.....	16,263
Butter, lbs.....	312,175	Population.....	24,000

San Jose is the county seat of Santa Clara County. It is 50 miles distant from San Francisco. It is reached by railroad; fare \$1.50.

SAN MATEO COUNTY.

San Mateo county embraces nearly the whole of the peninsula of San Francisco, which separates the bay from the Pacific Ocean. It is over thirty miles in length. It was organized in 1856, when it was separated from San Francisco, to which county it formerly belonged. It contains 154,908 acres, 150,000 of which are inclosed, 80,000 being under cultivation. The land is very fertile, and produces large crops of grain, as well as immense quantities of fruit and vegetables. There are in this county a large number of private mansions, surrounded by beautiful gardens. The price of land is high. The chief resources are grain and lumber.

San Francisco obtains its supply of fresh water for domestic purposes from Pillaritos Creek, in this county, distant about twenty miles from the city. Extensive works have been constructed for collecting and distributing the water, which is very pure and wholesome.

RETURNS OF COUNTY ASSESSOR FOR 1868-9.

Wheat, bhs.	450,000	Strawberry p.	3,000,000
Barley, bhs.	390,000	Grape Vines. .	756,378
Oats, bhs.	800,000	Hay, tons. . .	24,000
Potatoes, bhs. . .	600,000	Beets, tons. . .	2,000
Beans, bhs.	10,000	Lumber, ft. . .	10,000,000
Butter, lbs.	150,000	Shingles mde.	24,000,000
Cheese, lbs.	186,516	Population. . .	4,300

The county seat of San Mateo county is Redwood City, distant 28 miles from San Francisco, and connected with it by railroad three times a day. Stages run from here to Searsville and Woodside.

SAN FRANCISCO COUNTY.

San Francisco County is the smallest, but most important in the State. It is the northern end of a peninsula formed by the Bay of San Francisco on the east, and the Pacific Ocean on the west. It covers an area of 26,861 acres. The population is between 160,000 and 170,000. The land adjacent to the city of San Francisco is principally occupied by market gardeners, but there are a few small farms in the county.

San Francisco city is the metropolis of the State of California, the grand center of Commerce, Navigation, Manufactures, Arts, Science, and Literature. No other city in the world is composed of so cosmopolitan a population, or can boast of such remarkable rapidity in development. A quarter of a century ago it was a small village containing less than 100 inhabitants. Its progress dates from the American occupation of California in 1846, followed by the discovery of gold two years later. In 1847 the population numbered 459. Some very elegant and costly buildings attest the wealth and taste of the community; among the most prominent are the Mercantile Library, Merchants' Exchange, Bank of California, California Theatre, the Lick, Cosmopolitan, Occidental, and Grand Hotels, and Bancroft's Mammoth Publishing House. The public markets are liberally supplied. There are numerous benevolent societies, represented by almost every European nationality; they are well managed, and are of great service in checking pauperism. Many have hospitals connected with them. There are six cemeteries, the largest of which is Laurel Hill (late Lone Mountain). The public schools are the pride of the city and are maintained at a cost of nearly half a million of dollars per annum.

For the details on manufactured goods, we refer the reader to the article on manufactures in another part of this work. The city is traversed in all directions by street railroads. The North Pacific Transportation Company run steamers to all points along the coast, from Mazatlan in Mexico, to Victoria in the British Possessions, and to Alaska, also to the Sandwich Islands. The Pacific Mail Steamship Company run steamers to Panama, connecting with steamers to New York and Europe, also a monthly line to China and Japan, with expectation of running two a month. A line of steamers is also established to run to Australia and New Zealand, via Honolulu, Sandwich Islands, and ships of any size can enter and ride safely at anchor in the harbor, and trade is kept up with all parts of the world. Numerous railroads connecting with the interior, have their terminus in San Francisco, and particulars of them may be found on reference to the chapter on railroads.

The returns of the County Assessor for the years 1868-9, in addition to manufactures already referred to were as follows:

Potatoes, lbs. . .	142,460	Flour, bbls. . .	529,400
Turnips, tons. . .	2,190	Lumber, ft. .	24,200,000
Beets, tons.	2,555	Wool used, lbs.	3,250,000
Strawberry vines.	42,000	Population. . .	160,000

ALAMEDA COUNTY.

Alameda County forms the eastern shore of San Francisco Bay for about 36 miles; it contains about 800 square miles, or 512,000 acres. Nearly 175,000 acres are enclosed, and 130,000 under cultivation. There are about 20,000 acres along the bay overflowed by the tide; a company has recently been formed for their reclamation. Alameda creek, which runs through this county, supplies power for several grist and lumber mills. There is one railroad in the county; the San Francisco and Alameda Railroad, opened August, 1865, commences at Woodstock, on the slough at the mouth of the San Leandro creek, and extends to Haywards, sixteen miles east among the foothills of the Contra Costa mountains. This road connects with the Western Pacific at Washington Corners, 13 miles south of Haywards. The soil of the plains in this county is generally black, sandy loam, resting on a substratum of sand and gravel, and is sufficiently moist to grow any description of fruit, vegetables, or grain, without irrigation. The soil everywhere in the county is very fertile. Land is generally held at a high figure, but small tracts of land may be obtained in the neighborhood of the old Mission of San José, at prices within the reach of the farmer of moderate means.

RETURNS OF COUNTY ASSESSOR FOR 1868-9.

Wheat, lbs.	1,533,182	Flour, bbls.	69,590
Barley, lbs.	692,948	Strawberry pils.	5,384,973

* San Leandro, a town of 500 inhabitants, is the county seat of Alameda county; it is 18 miles from San Francisco, with which it is connected by ferry and railroad five times a day; fare 60 cents.

CONTRA COSTA COUNTY.

This county is bounded on the north by the San Pablo and Suisun bays and the San Joaquin river; on the east by the western channel of that river; on the south by Alameda county, and on the west by the bay of San Francisco. It contains upwards of 800,000 acres, about 150,000 of which are good

arable land; nearly 70,000 acres are under cultivation. Mountains and hills cover about 250,000 acres, including Monte Diablo, which contains the most important coal mines in the State. There are about 300,000 acres of swamp and overflowed land on the margin of Suisun bay, and along the banks of the San Joaquin river. Portions which have been reclaimed produce large crops of grain, fruit and vegetables. There are many good wagon roads in this county, connecting all parts of it with a market. Good agricultural land can be bought for from \$15 to \$25 per acre, though a large portion is held at much higher rates.

RETURNS OF COUNTY ASSESSOR FOR 1868-9.

Wheat, bhs.	600,718	Coal, tons.	71,000
Hay, tons.	16,107	Grape vines.	302,417
Beets, tons.	575	Sheep.	87,190
Butter, lbs.	170,523	Population.	9,500
Wool, lbs.	142,000		

The county seat of Contra Costa county is Martinez, distant from San Francisco 31 miles, and connected with it by steamer to Benicia, and thence by ferry. The fare is \$1.25.

MARIN COUNTY.

Marin county is very hilly, but abounds in fertile valleys. It is one of the best dairy counties in the State, and produces more butter than any other. It contains about 600 square miles, nearly 400,000 acres, 202,146 of which are enclosed, and 28,556 under cultivation, the remainder being used for pasturage. The owners of land in this county generally hold it at high prices; grazing farms in the hills may, however, be bought at a reasonable figure, and the profits on dairy products are so large that almost any farm will pay for itself and cost of stocking in two or three years.

In this county there is a paper mill and a powder mill. The former was erected in 1856, and the latter in 1866. In 1869 the paper mill turned out 400 reams of colored, 3,750 reams of news and book, and 10,000 reams of Manila and wrapping paper; the whole valued at \$72,500. In 1868 there was manufactured at the powder mill 30,000 kegs of blasting powder and over 2,000 packages of sporting powder.

The State Prison is situated in this county on Point San Quentin, twelve miles from San Francisco.

RETURNS OF COUNTY ASSESSOR FOR 1868-9.

Oats, bhs.	401,240	Butter, lbs.	1,896,400
Potatoes, bhs. . .	223,870	Cheese, lbs.	162,000
Hay, tons.	15,980	Neat Cattle. . .	20,280
Beets, tons.	750	Population.	6,900

San Rafael is the county seat of Marin county. It is 15 miles from San Francisco. The fare by ferry to San Quentin, and thence by rail, is \$1.25.

SONOMA COUNTY.

Sonoma county is bounded on the north by Mendocino and Lake counties; on the east by Lake and Napa; and on the south, southwest and west by Marin county and the ocean. It contains about 850,000 acres, of which 510,782 are enclosed, and 207,405 under cultivation. The climate of this county is extremely even and agreeable, and the soil is very fertile. In the valley of Russian River good crops of Indian corn may be grown without irrigation, this being one of the few valleys in this State where this cereal can be raised with facility. Bodega, in this valley, is famous for its yield of potatoes. 3,500 acres planted in 1868 produced 211,398 bushels.

Sonoma county is famous for its vineyards, and has more vines planted than any other county, no less than 4,112,279 vines being grown within its limits. Much of the wine produced is made into champagne.

Farms can be obtained in some portions of this county at moderate prices, but land generally, especially in the wine-growing districts, is high.

One of the finest and most beautifully located ranches for sale in small parcels is the "Guillicoe Ranch," for sale by Dr. H. W. Spencer, 415 Montgomery street, San Francisco.

RETURNS OF COUNTY ASSESSOR FOR 1868-9.

Wheat, bhs.	2,120,213	Strawberry pils	174,105
Barley, bhs.	212,121	Neat Cattle. . .	25,023
Oats, bhs.	201,357	Wine, gals.	343,136
Indian Corn, bhs.	85,726	Lumber, ft. . .	6,809,000
Hay, tons.	23,978	Shingles made.	3,653,000
Flour, bbls.	48,050	Population.	22,321
Grape Vines. . .	4,112,279		

The county seat of Sonoma county is Santa Rosa, a town of 1,800 inhabitants. It is 61 miles from San Francisco. It is connected by steamer twice a day to Petaluma—fare \$1—and thence by stage—fare \$2.50.

NAPA COUNTY.

Napa county contains about 450,000 acres, of which nearly one-half is valley and upland suitable for cultivation. 41,260 acres were under cultivation in 1868.

There is much rich land in this county, which may still be bought at a low price, though the opening of roads of late has tended greatly to enhance the value of real estate. In the valley, farms are from \$25 to \$100 an acre. Napa is a great vine-growing county, 1,590,255 vines being raised.

The value of real estate in this county has been much increased by the embellishments and improvements bestowed on Calistoga Springs, by Samuel Brannan, Esq. He has succeeded in making this delightful spot the fashionable watering-place of California. The springs are situated in a valley about 26 miles north of Napa City. They are connected by railroad with Vallejo. Mr. Brannan has built a fine hotel, a number of beautiful villa residences, and commodious stabling. The springs nearest the hotel have been enclosed in wooden tanks, and bathing houses have been

erected over several of them. The greater portion of the valley in which these springs are located is owned by Mr. Brannan, who has spent over \$100,000 in adorning it with shrubs and flowers. Calistoga Springs forms the summer resort of the fashionable world of San Francisco; and nothing has been left undone which can add to their comfort while staying there.

RETURNS OF COUNTY ASSESSOR FOR 1868-9.

Wheat, bhs.	601,250	Brandy, gals. . .	46,143
Hay, tons.	10,100	Apple Trees. . .	56,705
Hops, lbs.	17,000	Grape Vines. . .	1,590,255
Butter, lbs.	165,000	Population.	9,600
Wine, gals.	103,365		

The county seat of Napa county is Napa City, which contains about 3,500 inhabitants. It is 44 miles from San Francisco, with which it is connected by steamer to Vallejo, and thence by railroad—fare \$2. Stages run to Sonoma, 12 miles, fare \$1.

AMADOR COUNTY.

This county is bounded by El Dorado on the north; Alpine on the east; Calaveras on the south, and San Joaquin and Sacramento on the west. It is 52 miles in length east and west, and its average breadth is ten miles, and contains a population of 11,400. The chief business carried on in the county is mining, though there are many well cultivated farms, and situated among the lower foothills of Amador are some of the richest valleys in the State. The price of land is not very high; improved farms can be bought at from \$5 to \$10 per acre. The returns of the County Assessor show that 69,240 tons of ore were crushed in Amador county during the years 1868-9.

The county seat of Amador county is Jackson, which has about 1,000 inhabitants. It is 181 miles from San Francisco. It may be reached by steamer to Sacramento, railroad to Latrobe, and thence by stage. The fare is \$13.50.

ALPINE COUNTY.

This county is very mountainous, and the amount of land suited to agricultural purposes is too limited to make it worth the while of the immigrant from the Eastern States to proceed hither in search of a farm. The number of inhabitants does not exceed 400.

The county seat of Alpine county is Silver Mountain. It is 360 miles from San Francisco. It is reached by steamer to Sacramento, railroad to Reno, stage to Carson, and thence by stage—fare \$32.25. Stages run from this place to Big Trees, Murphy's and Stockton.

LAKE COUNTY.

Lake county is bounded on the north by Colusa and Mendocino, on the south by Napa and Sonoma, on the east by Colusa and Yolo, and on the west by Mendocino and Sonoma. It is about 60 miles in length, with an average width of 15 miles, and contains a population of 4,100. The land under cultivation in 1868-9 exceeded 7,500 acres, from which good crops of wheat, barley and vegetables were obtained. Good land is held at from \$20 to \$50 per acre. Clear Lake abounds in fish and wild fowl. There are many dairy farms in this county, and the cheese produced has a high reputation.

There are important milling interests in this county, the most valuable timber claim and milling interests being owned by H. W. Rice & Co.

RETURNS OF COUNTY ASSESSOR FOR 1868-9.

Wheat, bhs.	70,420	Butter, lbs.	28,500
Barley, bhs.	25,475	Cheese, lbs.	23,056

The county seat of Lake county is Lakeport. It is 117 miles from San Francisco. It is reached by steamer to Petaluma, stage to Cloverdale, and thence by stage. The fare is \$7.

MENDOCINO COUNTY.

Mendocino county is bounded on the north by Humboldt; on the east by Colusa and Lake; on the south by Sonoma, and on the west by the Pacific Ocean. Its length is about eighty miles; its average width about forty miles. It contains over 2,000,000 acres, of which 900,000 are fit for cultivation, and 200,000 are good grazing lands, the balance being composed of rugged hills and lofty mountains. At the close of 1868 there were 139,000 acres enclosed, and in 1869, 54,000 acres were under cultivation.

The lumber trade in this county gives employment to one-half its population. There is in this county a considerable amount of land suited to agricultural purposes, still unclaimed, and open to pre-emption. The scarcity of good roads is one cause why this rich county is still uninhabited. All descriptions of grain, fruit and vegetables can be raised. Much of the land open to pre-emption is covered with thick forests, the lumber from which will amply repay the settler for his labor. The country everywhere swarms with game of all descriptions, and delicious fish are caught in the streams and lakes. To the immigrant of small means this county offers tempting inducements, and the network of railways which is fast spreading over the State must ere long be extended to this section. Corn, hemp and tobacco grow vigorously in the valleys. The forests supply abundant feed for hogs, which are raised in large numbers. Land, not far from Ukiah City, the county seat, which will soon be connected with Napa Valley by railroad, is cheap, the price of good improved farms varying from \$5 to \$20 per acre. Large tracts of grazing lands have recently been entered in this county, one of the most valuable of which has been claimed and entered by Francis Avery & Co., of San Francisco, and is known as the beautiful "Eden Valley."

RETURNS OF COUNTY ASSESSOR FOR 1868-9.

Wheat, bbs.	226,000	Hogs.	80,000
Hops, lbs.	120,000	Lumber, ft. . .	60,000,000
Hay, tons.	19,080	Shingles. . .	5,000,000
Sheep.	60,000	Population. . .	8,000

The county seat of Mendocino county is Ukiah, a town of 400 inhabitants. It is 128 miles from San Francisco. It is reached by steamer to Petaluma, stage to Cloverdale, and thence by stage: the fare is \$8.50.

NORTHERN COUNTIES.

The Northern counties comprise Humboldt, Trinity, Klamath, Del Norte, Siskiyou, Shasta, Lassen, Calaveras, Tealume, Mariposa, Mono, and Inyo.

HUMBOLDT COUNTY.

Humboldt county is bounded on the north by Klamath, on the east by Trinity, on the south by Mendocino, and on the west by the Pacific Ocean. It is 56 miles long, north and south, and 60 miles wide, containing 1,800,000 acres of land, of which about five hundred thousand are suited to agricultural and three hundred thousand to grazing purposes, there being about five thousand acres of swamp or overflowed land near tide water. This latter will doubtless occupy the attention of the Tide Land Reclamation Company, when it extends its sphere of operations. The land near the coast is covered with heavy forests of redwood, spruce and pine. The county abounds in bears, elk, deer, and other game. Some of the valleys in this State produce seventy bushels of wheat to the acre, weighing sixty-one pounds to the bushel, and over one hundred bushels of oats, weighing forty-four pounds to the bushel; this is not an unusual yield. Fifteen tons of potatoes to an acre is not over an average crop. The salmon fishery at the mouth of Eel river is the most profitable in the State, the annual catch ranging from eleven hundred to three thousand barrels. Much of the land is well adapted for dairy farms. Good roads, connecting this county with the Sacramento Valley, are being built. Land is very cheap and extremely rich; much is still open to pre-emption. This county offers great inducements to the immigrant, and will doubtless within a short time be thickly settled.

RETURNS OF COUNTY ASSESSOR FOR 1868-8.

Wheat, bhs.	49,767	Strawberry Pl.	58,770
Barley, bhs.	20,840	Butter, lbs. . .	67,820

Pears, lbs.	58,384	Lumber, ft. . .	30,250,000
Apple Trees. . .	47,860	Shingles. . .	6,120,000
Raspberry Plnts	54,127	Population. . .	6,600

The county seat of Humboldt county is Eureka, a town of one thousand inhabitants. It is two hundred and twenty-three miles from San Francisco. It may be reached by steamer to Petaluma, stage to Cloverdale, and thence by stage—fare \$33.60; or the traveler may take the steamer of the North Pacific Navigation Company, which leaves San Francisco twice a month—fare \$21.

TRINITY COUNTY.

Trinity county is bounded on the north by Klamath and Siskiyou, on the east by Shasta and Tehama, on the south by Mendocino, and on the west by Humboldt. The county comprises twenty-four hundred square miles, only ten or fifteen thousand acres being fit for farming land, four thousand two hundred and eighty-four acres of which were under cultivation in 1868-9. The chief industrial pursuit is gold mining in placer diggings.

RETURNS OF COUNTY ASSESSOR FOR 1868-9.

Wheat, bush. . . .	14,192	Lumber, ft. . .	1,650,000
Potatoes, bush. .	13,091	Population. . .	3,122
Hay, tons.	3,424		

The county seat of Trinity county is Weaver-ville, a town of about one thousand inhabitants. It is about 365 miles from San Francisco. It is reached by steamer to Sacramento, stage to Shasta, and thence by stage.

KLAMATH COUNTY.

Klamath is a mining county, only two or three thousand acres being under cultivation. There is much forest land, however, which could be cleared and turned into farms.

RETURNS OF COUNTY ASSESSOR FOR 1868-9.

Wheat, bush.	1,413	Lumber, ft. . .	4,135,617
Corn, bush.	1,066	Ore crushed, t. .	3,000
Oats, bush.	3,860	Population.	2,500
Pears, bush.	3,881		

Orleans Bar is the county seat of Klamath county. It is 548 miles from San Francisco. It is 65 miles west of Trinidad, the only port in the county which connects with San Francisco by means of schooners in the lumber trade. Stages from Yreka connect with others for all parts of the county.

DEL NORTE COUNTY.

Del Norte county is bounded by Oregon on the north; Siskiyou county on the east; Klamath county on the south; and the Pacific ocean on the west. It is about fifty miles long east and west, and thirty miles wide. It contains a number of small fertile valleys, and a large extent of rich prairies, together with three thousand five hundred acres of swamp and overflowed lands. The number of acres enclosed in 1868-9 amounted to 5,265, of which 1,657 were under cultivation, the most of it being planted with wheat, of which grain there were about 10,346 bushels raised. The county is well timbered with redwood, spruce and pine. Fruit, grain and vegetables of all descriptions flourish here. Land for agricultural purposes can be purchased cheap.

RETURNS OF COUNTY ASSESSOR FOR 1868-9.

Wheat, bbs.	10,346	Potatoes, bbs. . .	16,540
Oats, lbs.	20,057	Population.	3,600

The county seat of Del Norte county is Prescott City, which has a population of about 500. It is 280 miles from San Francisco, with which it is connected by steamer twice a month. The fare is \$16.50, steerage.

SISKIYOU COUNTY.

This county is bounded on the north by Oregon ; on the east by the State of Nevada ; on the south by Lassen, Shasta and Trinity, and on the west by Klamath and Del Norte counties. Its length east and west is 160, and its width 58 miles. It contains 5,300,000 acres, of which 250,000 is suited to agriculture. In the year 1868-9 there were 75,200 acres enclosed, and 24,263 under cultivation. About 1,000,000 acres are covered by valuable forests, and about half as much more by several large lakes, of which Goose, Rhett and Wright are the principal. The principal agricultural lands in the county are located in Scott, Shasta and Surprise valleys. Grain, fruit and vegetables are grown in large quantities, wheat averaging twenty-five bushels per acre, and some fields turning out as high as forty-five. The county abounds in game of all kinds. There is much good land open to pre-emption, and many improved farms are for sale at a low price.

RETURNS OF COUNTY ASSESSOR FOR 1868-9.

Wheat, bhs. 220,500 Butter, lbs. 94,780
Barley, bhs. 110,200 Cheese, lbs. 17,892
Oats, bhs. 168,000 Neat Cattle. 28,500
Potatoes, bhs. 51,400 Lumber, ft. 4,200,000
Corn, bhs. 29,570 Shingles. 4,500,000
Hay, tons. 8,595 Population 9,500

The county seat of Siskiyou county is Yreka. It is 405 miles from San Francisco. It is reached by steamer to Sacramento, railroad to Oroville, and thence by stage; the fare is \$39.

SHASTA COUNTY.

Shasta is bounded on the north by Siskiyou ; on the east by Suisun ; on the south by Plumas and Tehama, and on the west by Trinity county. The county is watered by the Sacramento river, and is one of the best irrigated counties in the State. The number of acres enclosed in 1868 was about sixty-five thousand, of which thirty-five thousand were under cultivation. Ten thousand acres planted to wheat, yielded two hundred and fifty thousand bushels; seven thousand acres planted to barley, one hundred and ninety thousand; and two thousand planted to oats, fifty thousand. Fruit is produced in abundance; the fig, pomegranate and almond thrive in the open air. Shasta has produced the best tobacco grown in the State. Large forests cover the northern and western portions of the county. This land is open for pre-emption, and when cleared will provide fertile farms for many immigrants. Hogs and sheep are raised in large numbers, and there are many fine dairy farms. While much of the land is held at high rates, farms can be obtained in many parts of the county at prices adapted to the farmer of small means.

RETURN OF COUNTY ASSESSOR FOR 1868-9.

Lumber, ft. 4,856,000/Shingles. 413,000

There were no returns of agricultural products or population.

The county seat of Shasta county is Shasta, which contains about one thousand two hundred inhabitants. It is two hundred and seventy-four miles from San Francisco. It is reached by steamer to Sacramento, and thence by stage—fare \$22.50

LASSEN COUNTY.

Lassen is bounded on the north by Siskiyou county; on the east by the State of Nevada; on the south by Sierra and Plumas, and on the west by Plumas and Shasta counties. Lassen county is chiefly rugged mountains, alkali flats, and arid sage plains, the only considerable body of good land in it being that lying along and adjacent to Susan river, generally denominated Honey Lake Valley, with a narrow strip in Long Valley further south. Long Valley is a fine stock region, affording pasture for thousands of head of cattle. Honey Lake Valley produces grain in abundance, and comprises some fine grazing land. The quantity of land suited for this purpose being so limited, we cannot recommend the agriculturist to turn his attention to Lassen county.

RETURNS OF COUNTY ASSESSOR FOR 1868-9.

Barley, bhs. 81,560 Strawberry plts. 253,745
Oats, bhs. 33,392 Neat Cattle. 18,300
Hay, tons. 5,603 Population. 1,550
Butter, lbs. 40,000

The county seat of Lassen county is Susanville. It is 296 miles from San Francisco. It is reached by steamer to Sacramento, railroad to Oroville, and thence by stage. The fare is \$23.

CALAVERAS COUNTY.

This county is bounded by Amador on the northwest; by Alpine on the northeast; by Tuolumne on the southeast, and by Stanislaus and San Joaquin counties on the southwest. It has an average length of forty miles, with a width of about twenty. It is thickly wooded. Some of the forest lands, if cleared, would afford good farms to the agriculturist, and the number of good roads connecting the county with all parts of the State would afford him an opportunity of sending his produce to market. Good agricultural land is however, as a rule, scarce; the county being more rich in mineral than farming lands. In 1868-9 there were 45,914 acres of land enclosed, of which 12,387 were under cultivation. Farms suited to raising all kinds of grain, fruit and vegetables, may be obtained on the foothills and in the valleys at very moderate prices.

RETURNS OF COUNTY ASSESSOR FOR 1868-9.

Wheat, bhs. 6,764 Barley, bhs. 17,209
Corn, bhs. 6,750 Potatoes, bhs. 5,432
Hay, tons. 5,167 Butter, lbs. 22,090
Wool, lbs. 33,600 Strawberry plts. 758,019
Grape vines. 704,471 Wine, gals. 55,132
Lumber, ft. 2,830,000 Population. 11,056
Ore crsh'd, tns. 11,536

The county seat of Calaveras county is San Andreas, and is 152 miles from San Francisco. It

is reached by steamer to Stockton, and thence by stage—fare \$9.

TUOLUMNE COUNTY.

This county has an average length of sixty, with a width of thirty-five miles. It lies between Calaveras and Alpine on the north, and Mariposa on the south; and between Mono on the east, and Stanislaus and Calaveras on the west. It is essentially a mining county, though there are many good farms, orchards and vineyards. In 1868-9 46,025 acres were enclosed, of which 9,412 were under cultivation. There are good roads, and the products of the farms find a ready market in the mining towns and camps east of the mountains.

RETURNS OF ASSESSOR FOR 1868-9.

Wheat, bhs. 9,739 Wine, gals. 50,597
Barley, bhs. 5,612 Lumber, ft. 2,260,000
Potatoes, bhs. 4,888 Shingles. 473,000
Grape vines. 342,317 Population. 6,009
Strawberry plts. 304,975 Ore crsh'd, tns. 35,200

The county seat of Mariposa county is Mariposa. It has a population of about one thousand. It is two hundred and ten miles from San Francisco; whence it may be reached by steamer to Stockton, and thence by stage; fare \$14.

MONO COUNTY.

Mono county is bounded on the north and east by the State of Nevada, south by Inyo and Fresno counties, and on the west by the counties of Alpine, Tuolumne, Mariposa and Fresno. There is much fertile and valuable land in the county, but its distance from market, and the difficulty attending the transportation of produce, has prevented the development of Mono county. There is a beautiful valley stretching through the county for some sixty miles north of the Inyo county line which is some fifteen or twenty miles wide, and perhaps not excelled for agricultural purposes by any valley in the State. The Bishop creek country is in this valley. Grist mills and sawmills are

east by the State of Nevada and San Bernardino county, south by Kern and San Bernardino, and west by Tulare. This county is noted for its fine agricultural lands in the valley of Owen's Lake. It extends from the mouth of the Owens river the whole length of the valley north into Mono county, but owing to the great distance from any other agricultural district, the cereals bring a large price on the ground for home consumption, freight from Los Angeles being six cents per pound to Independence and Cerro Gordo, the latter being the great mineral district of the State for lead and silver.

Olancha, a city laid out on the southwestern shore of the lake, is destined to become a point of great importance, possessing as it does the key to the entrance of the valley, as well as farming land, with an abundant supply of wood and water for the reduction of metals, and will probably have a large transportation by water on the lake of merchandise and ores to and from this point

[We re-publish this map to give new readers the general outline of the counties and location of the county seats.—Ers. Press.]

The county seat of Tuolumne county is Sonoma; a town of over two thousand inhabitants. It is 173 miles from San Francisco. It is reached by steamer to Stockton, and thence by stage, via Chinese Camp. The fare is \$12.

MARIPOSA COUNTY.

Mariposa is bounded by Tuolumne on the north; by Mono on the east; by Fresno on the south, and by Merced on the west. It measures sixty-five miles east and west, and about twenty-eight north and south. It is very mountainous, and contains but little good farming land. Of the twenty-three thousand four hundred and forty acres enclosed in 1868-9 about four thousand eight hundred were under cultivation.

RETURNS OF COUNTY ASSESSOR FOR 1868-9.

Wheat, bush. 10,300 Wool, lbs. 53,000
Barley, bush. 18,500 Sheep. 12,000

Barley, bush. 2,870 Butter, lbs. 3,500
Oats, bush. 900 Cheese, lbs. 500
Potatoes, bush. 5,000 Population. 700

The county seat of Inyo county is Independence, distant about 520 miles from San Francisco. It is reached by rail to Gilroy, and thence by stage; fare \$64.

VALLEY COUNTIES.

The Valley counties comprise Tehama, Butte, Colusa, Sutter, Yuba, Yolo, Solano, Sacramento, San Joaquin, Stanislaus, Merced, Fresno and Tulare.

TEHAMA COUNTY.

Tehama is bounded by Shasta on the north, Plumas and Butte on the east, Butte and Colusa on the south, and Mendocino and Trinity on the

west. Its average length east and west is about 78 miles, and its average breadth 38, giving a superficial area of nearly 3,000 square miles. Much of it is well timbered, and it is well watered by creeks flowing from the mountains. Tehama is a farming and stock raising county, and contains some of the best grain growing lands in the State. In 1867 there were 70,715 acres enclosed, of which 16,000 were under cultivation. There are more than half a million vines in the county. Indian corn flourishes. There is much good land in this county which can be purchased at a moderate price.

RETURNS OF COUNTY ASSESSOR FOR 1868-9.

Wheat, bush.... 386,030 Butter, lbs..... 33,604
Barley, bush.... 19,086 Cheese, lbs..... 20,010
Oats, bush.... 7,000 Honey, lbs..... 3,420
Corn, bush.... 2,576 Strawberry Plts., 128,161
Grape Vines.... 246,212 Population..... 5,200
Hay, tons..... 6,112

The county seat of Tehama county is Red Bluff, which has a population of 2,500, and is distant 255 miles from San Francisco. It is reached by rail to Sacramento, and thence by steamer or by rail to Oroville, and thence by stage via Chico; fare \$20.

BUTTE COUNTY.

Butte is bounded on the northwest by Tehama, on the northeast by Plumas, on the southeast by Yuba, on the south by Sutter, and on the west by Colusa county. Its extreme length north and south is a little over sixty, and its average breadth thirty-five miles. It is both a farming and mining county. It contains much rich bottom land along the Sacramento river. It is well watered everywhere. It has good roads and facilities for shipping produce to San Francisco, by the Sacramento river. The ordinary yield of the land is about thirty bushels of wheat, and forty-five of barley to the acre. Much fruit is raised, and there are many large vineyards in the county. An important product of this county is peannts, which are grown in immense quantities by the Chinese. The farmer of small means need not despair of finding a farm suited to his means in this county; and having once settled there, will be amply repaid for his outlay by the agreeable climate, rich soil, and ready market for his productions.

RETURNS OF COUNTY ASSESSOR FOR 1868-9.

Wheat, bush.... 344,480 Peannts, lbs.... 51,500
Barley, bush.... 196,686 Tobacco, lbs.... 11,000

Potatoes, bush.... 19,691 Honey, lbs..... 10,215
Hay, tons..... 8,410 Population..... 14,609

The county seat of Butte county is Oroville, a city of fifteen hundred inhabitants. It is 191 miles from San Francisco. It is reached by steamer to Sacramento, and thence by railroad. The fare is \$10.50.

COLUSA COUNTY.

Colusa is bounded by Tehama on the north, by Butte and Sutter on the east, Yolo on the south, and Lake and Mendocino on the west. It is fifty-seven miles in length north and south, and forty-five miles in breadth. The western part, constituting about one-third of the county, being covered by the Coast Range, is hilly or mountainous; the balance, consisting of rich alluvial, or less fertile prairie land, is nearly all level and well adapted to the growing of fruits and grain; this being almost exclusively an agricultural and stock raising county. Sheep and swine raising is pursued to a great extent. Rich tule lands, easy of reclamation, stretch for many miles along the steamy slough, and other streams running into the Sacramento. They amount in the aggregate to about thirty thousand acres. Farms may be bought in this county at from \$2.50 to \$10 per acre.

RETURNS OF COUNTY ASSESSOR FOR 1868-9.

Wheat, bush.... 1,642,380 Cheese, lbs.... 1,724
Barley, bush.... 506,220 Honey, lbs..... 15,373

Potatoes, bush.... 1,250 Population..... 9,500
Butter, lbs..... 18,520

The county seat of Colusa county is Colusa. It is two hundred miles from San Francisco. It is reached by steamer to Sacramento, railroad to Marysville, and thence by stage; fare, \$11.

SUTTER COUNTY.

This county is bounded on the north by Butte, on the east by Yuba and Placer, on the south by Sacramento and Yolo, and on the west by Yolo and Colusa counties. It is only about forty miles long by fifteen wide, and is, for its size, one of the most productive counties in the State. It is thoroughly cultivated, and all the products of California are raised in abundance. A person wishing to buy a farm in this county must have a long purse.

RETURNS OF COUNTY ASSESSOR FOR 1868-9.

Wheat, bush.... 423,187 Butter, lbs..... 56,550
Barley, bush.... 246,781 Cheese, lbs.... 5,390
Oats, bush.... 7,070 Wool, lbs..... 105,460
Corn, bush.... 30,780 Hay, tons..... 7,234
Potatoes, bush.... 6,390 Population..... 4,880
Hops, lbs.... 12,117

The county seat of Sutter county is Yuba City, distant 167 miles from San Francisco. It is reached by steamer via Sacramento.

YUBA COUNTY.

Yuba is bounded on the northwest by Butte, on the east by Sierra and Nevada, on the south by Nevada, Placer and Sutter, and on the west by Sutter county. Its length measured northeast and southwest is fifty-seven, and its average width about eighteen miles. Part of it is still well timbered. The enclosed land amounts to about 57,660 acres, of which 26,343 are under cultivation.

Wheat growing is the chief industry of the county, though immense quantities of fine fruit are produced. Land in this county is generally held at a high price.

RETURNS OF COUNTY ASSESSOR FOR 1868-9.

Wheat, bush.... 53,725 Hay, tons..... 9,197
Barley, bush.... 147,480 Grapevines.... 424,665

Marysville is the county seat of Yuba county. It is a city of six thousand inhabitants, distant 139 miles from San Francisco. It is reached by the steamer to Vallejo, and thence by railroad via Sacramento; fare, \$8.

YOLO COUNTY.

Yolo is surrounded by the following counties, viz: Colusa, north; Sutter and Sacramento, east; Solano and Napa, south; Solano, Napa and Lake lying to the west. This is exclusively an agricultural county; farming, dairying, stock-raising and fruit-growing forming the sole occupation of the inhabitants. It is about sixty miles in length and twelve in breadth. Every acre of it is settled on and held at a high price.

RETURNS OF COUNTY ASSESSOR FOR 1868-9.

Butter, lbs.... 68,950 Population..... 11,780

The county seat of Yolo county is Woodland, 107 miles from San Francisco, whence it is reached by steamer to Vallejo, railroad to Sacramento, and thence by stage. The fare is \$6.

SOLANO COUNTY.

This county is about thirty miles in length and twenty-eight in breadth. It is bounded on the north by Yolo, on the east by Yolo and Sacramento; on the south by Contra Costa county, the Bay of Suisun, and the Straits of Carquinez, and on the west by Napa county. This is one of the most wealthy, populous and largely productive agricultural counties in California. Nearly all the inhabitants are employed in farming. There are large tracts of tule lands which may be reclaimed at a small expense, but with the exception of these there are but few lands in the county which offer to the agriculturist an opportunity to obtain a farm cheaply.

RETURNS OF COUNTY ASSESSOR FOR 1868-9.

Wheat, bush.... 1,635,481 Grapevines.... 654,396
Barley, bush.... 207,750 Population..... 3,183
Hay, tons..... 20,943

The county seat of Solano county is Fairfield, fifty miles from San Francisco. It is reached by steamer to Vallejo, and thence by railroad; fare, \$3.

SACRAMENTO COUNTY.

Sacramento county is bounded on the north by Sutter and Placer; on the east by El Dorado and Amador; on the south by San Joaquin, on the west by Solano and Yolo counties. Its average length measured north and south is thirty-six, and its width about thirty miles; giving it a superficial area of six hundred and ninety-one thousand, two hundred acres. There is scarcely an acre of land in this county which is not susceptible of cultivation. Stretching along the Sacramento river is a belt of tule land, which in some parts is fifteen miles in breadth. This land, which, when free from overflow, produces the largest crops of any in the State, we hope soon to see brought into cultivation, through the efforts of the TIME LAND RECLAMATION COMPANY, which has already bought a large portion of it with that end in view. Though land in this county is deservedly held at a high figure, in consequence of its fertility, the ample facilities for bringing its products to a market, and other advantages, there are still many opportunities offered the immigrant in search of a farm to obtain possession of a tract of fertile land at a moderate price.

RETURNS OF County Assessor for 1868-9.

Wheat bush 124,626 Hay Tons 17,511
Barley..... 304,639 Butter lbs. 215,412
Oats..... 32,444 Cheese..... 32,940

Potatoes..... 33,885 Honey..... 10,170
Onions..... 21,656 Grape Vines.... 1,598,507
Population 35,000.

The county seat of Sacramento County is Sacramento—the Capital city of the State—containing 20,000 inhabitants. Sacramento is reached by steamer to Vallejo, and thence by railroad; fare \$3 or by steamer direct, \$1.50.

SAN JOAQUIN COUNTY.

San Joaquin is about forty miles in length, by thirty-five in width. It is bounded by Sacramento county on the north; by Amador, Calaveras and Stanislaus on the east; by Stanislaus on the south, and by Alameda and Contra Costa counties on the East. San Joaquin is almost exclusively an agricultural county. Of the 895,000 acres comprised within its limits, over three-fourths are capable of producing good crops of grain. There are 200,000 acres of tule land, which, when reclaimed, will add much to the wealth of this county. Every variety of fruit and vegetable is grown here. There is much rich land in this county which can be bought at from \$2.60 to \$10 per acre.

RETURNS OF County Assessor 1868-9.

Wheat hus. 1,750,000 Hay tons 22,000
Barley..... 440,000 Butter lbs. 200,000

The county seat of San Joaquin County is Stockton, a city of 10,000 inhabitants. It is 110 miles from San Francisco, with which it connects by steamer and railroad daily; fare \$1.50 and \$2.00.

STANISLAUS COUNTY.

Stanislaus county is forty-eight miles in length, and about twenty-six in breadth; containing 798,720 acres, of which a large proportion is rich farming land. A large belt of tule land, easily reclaimable, stretches along the San Joaquin river. A portion of this county is embraced in the great San Joaquin Valley, which is unexcelled in fertility by any portion of the State. All the products of California grow freely in Stanislaus county. Good land may be obtained at from \$2.50 to \$10 per acre.

RETURNS OF County Assessor for 1868-9.

Wheat bush. 144,000 Hay tons 1,500
Barley..... 854,360 Butter lbs. 20,000
Corn..... 4,500 Cheese..... 5,200
Potatoes..... 1,600 Wool..... 4,978,000
Population 3,644.

The county seat of Stanislaus is Knights Ferry. It is 167 miles from San Francisco. It is reached by steamer or railroad to Stockton, and thence by stage; fare \$13.

MERCED COUNTY.

This county is bounded on the northwest by Stanislaus; on the northeast by Mariposa; on the southeast by Fresno, and on the southwest by Monterey county. It is about 60 miles in length east and west, with an average breadth of twenty miles, forming an area of 1,075,200 acres. The Merced and San Joaquin rivers run through it. In 1868 the amount of land enclosed was 135,000 acres, 33,000 of which were under cultivation. Grain, fruit, and vegetables of all descriptions are produced, and large quantities of stock are raised. There is much good land in this county obtainable at a low price.

RETURNS OF County Assessor for 1868-9.

Wheat husb. 225,000 Hay tons 4,000
Barley..... 276,000 Wool lbs. 473,785
Corn..... 55,000 Honey..... 18,600

Onions..... 2,100 Cheese..... 2,400
Population 3,000

Snelling is the county seat of Merced County. It is 174 miles from San Francisco. It is reached by steamer or railroad to Stockton, and thence by stage. The fare is \$11.

FRESNO COUNTY.

Fresno county is one hundred and twenty miles in length, with an average width of sixty-five miles; and contains 5,200,000 acres of pastoral, agricultural and mineral lands. It is bounded on the north by Merced and Mariposa; on the south by Tulare; and is flanked by the Sierras on the east, and the coast range on the west. The greater portion of this county is included in the fertile San Joaquin Valley. There are twenty thousand acres of tule land in this county, which are capable of reclamation, which will render them among the most valuable in the world. This county offers immense advantages to the intending settler, and will doubtless, ere long, be covered with the homes of a prosperous agricultural population. There is much rich land for sale and lease, on easy terms. A large tract between San Joaquin river, Fresno City and King's river, comprising some of the most fertile lands in the valley, has been by the San Joaquin Land Association divided into farms, which the immigrant can either lease on easy terms, or purchase at prices ranging from \$2.60 to \$10. This tract comprises some of the best wheat land in the state and the produce of a farm would in one or two years pay back to the purchaser the money he expended in obtaining possession of it. There are many miles of the richest land in California in the vicinity of King's river, and in fact, in all parts of this county. The completion of the railroad which it is proposed to construct through this valley, will quadruple the price of all land, and the opportunity at present offered, is one of which all wishing to purchase farms in this state should avail themselves.

RETURNS OF County Assessor for 1868-9

Wheat husb. 7,465 Hay tons 710
Barley..... 126,240 Butter lbs. 8,700
Corn..... 9,943 Wool..... 271,500
Potatoes..... 114,160 Honey..... 10,260
Population 2,400.

The county seat of Fresno County is Millerton, 175 miles from San Francisco. It is reached by steamer or railroad to Stockton, stage to Hornitos, and thence by stage; fare \$19.

TULARE COUNTY.

Tulare county extends one hundred and thirty miles in a northwesterly and southeasterly direction, and has an average width of one hundred miles, giving it an area of eight million three hundred and three thousand acres. It is bounded on the north by Fresno, on the east by Inyo and San Bernardino, on the south by Los Angeles, and on the west by Santa Barbara and San Luis Obispo counties. Here are lands for all, a fertile soil, a delightful climate, and everything the heart of man can desire. Timber and water are abundant, and the woods provide for thousands of swine. Every description of grain, fruit and vegetables can be raised in profusion. Thousands of acres of swamp land await reclamation to become equal in fertility to the Delta of the Nile. Cattle thrive without housing or fodder, and sheep are raised in large numbers. In 1868, 83,111 acres were in cultivation. This leaves a large proportion of eight million three hundred and twenty thousand acres to the enterprising immigrants. The railroad which is shortly to run through this county will cause an influx of thousands of settlers, who will here make for themselves the most delightful homes in the world. To Tulare county the immigrant in search

of land can direct his steps with the surety of meeting with what he wants. Much of the land is open for pre-emption and improved farms can be bought at very reasonable prices. All this will be changed when the railroad is built, and thousands will not then be able to purchase the land which is now obtainable, for nothing, or by the outlay of a few dollars.

RETURNS OF County Assessor for 1868-9.

Wheat, bush.... 40,884 Butter, lbs..... 12,414
Barley, bush.... 70,584 Wool, lbs. 539,750
Corn, bush.... 9,515 Honey, lbs. 7,850
Potatoes, bush.... 14,000 Population..... 9,000
Hay, tons..... 1,640

The county seat of Tulare County is Visalia which has a population of 1,500. It is 228 miles from San Francisco. It is reached by railroad to Gilroy, and thence by stage; fare \$24.

MOUNTAIN COUNTIES.

The Mountain Counties comprise Plumas, Sierra, Nevada, Placer and El Dorado.

PLUMAS COUNTY.

Plumas county is bounded on the north by Shasta and Lassen counties; on the east by Lassen; on the south by Sierra and Yuba counties, and on the west by Butte and Tehama counties. It has an area of about two thousand square miles. This county is covered with forests of pine, and is one of the best timbered counties in the state. It contains many well-sheltered, fertile valleys, and much rich meadow land, suitable for agricultural and grazing purposes. A railroad, which is shortly to be carried through Beckworth's Pass, over the Sierra, will bring the products of the land within reach of a market. There are over one hundred thousand acres of land under fence, and planted to grain and vegetables. Land can be bought here at a low price, and the forest land is opened to pre-emption.

Quincy is the county seat of Plumas county. It is 276 miles from San Francisco. It is reached by railroad to Oroville, and thence by stage via La Porte. The fare is \$23.60.

Wheat, bush.... 19,170 Butter, lbs. 163,000
Barley, bush.... 3,200 Grapevines.... 2,300
Oats, bush.... 35,784 Strawberry plants. 78,500
Potatoes, bush.... 8,519 Population..... 5,000
Hay, tons..... 13,600

SIERRA COUNTY.

This county is bounded by Plumas county on the North; the State of Nevada on the east; the county of Nevada on the south, and the counties of Yuba and Plumas on the west. This county in soil, climate and topography, much resembles Plumas county. Sierra county presents but few inducements to the farmer, there being but a very small amount of agricultural land with its limits, and the climate being excessively cold.

RETURNS OF COUNTY ASSESSOR FOR 1868-9.

Wheat, bush.... 7,585 Butter, lbs. 47,975
Barley, bush.... 12,257 Cheese, lbs. 2,490
Oats, bush.... 7,900 Grapevines.... 9,000
Potatoes, bush.... 10,240 Population..... 5,000
Hay, tons..... 6,305

The county seat of Sierra county is Downieville, which has about 1,500 inhabitants. It is reached by railroad to Marysville, and thence by stage. The fare is \$18.

NEVADA COUNTY.

Nevada county is bounded on the north by Yuba and Sierra counties; on the east by the State of Nevada; on the south by Placer, and on the west by Yuba county. It is sixty-five miles in length east and west, and fifteen in breadth; covering an area of about one thousand one hundred square miles. This county is very picturesque, having many rolling prairies, wooded mountains, and beautiful valleys. It is well timbered, and the forests abound in flowering scrubs. The soil on the uplands is of a rich ferruginous loam, that of the bottoms a dark vegetable alluvium, well adapted for the culture of fruit. Considerable quantities of grain are raised, and large portions of the land are devoted to the culture of the vine. The chief industrial interest of the county is quartz mining. Good farming land may be bought at a very moderate figure in many parts of the county, and a ready market obtained for agricultural products.

The returns of the County Assessor for the year 1868-9, were very meagre, and by no means reliable, so they are better omitted.

The county seat of Nevada county is Nevada City, which has a population of 6,000. It is 191 miles from San Francisco. It is reached by railroad to Colfax, and thence by stage. The fare is \$10.25.

PLACER COUNTY.

Placer county is bounded on the north by Yuba and Nevada counties; on the east by the State of Nevada, on the south by El Dorado and Sacramento, and on the west by Sutter and Nevada counties. It is eighty miles in length east and west, having an average width of but fourteen miles. Placer contains a good amount of agricultural land, its western part being wholly devoted to farming, sheep, hog and cattle raising. It is well timbered, and much of the forest land when cleared will be found well adapted to agricultural purposes. The chief industry of the county is mining, and here we must observe that in these mining counties the immigrant in search of a farm is most likely to find land unsettled, which he can pre-empt, or tracts which he can purchase at a nominal figure.

RETURNS OF COUNTY ASSESSOR FOR 1868-9.

Wheat, bush.... 74,060 Cheese, lbs. 1,000
Barley, bush.... 21,350 Wool, lbs. 73,120
Potatoes, bush.... 4,200 Honey, lbs. 14,775
Hay, tons..... 8,170 Population..... 13,750
Butter, lbs. 99,050

The county seat of Placer county is Auburn, which has 1,000 inhabitants; it is 156 miles from San Francisco. It is reached by railroad; the fare is \$6.50.

EL DORADO COUNTY.

This county is bounded by Placer on the north; a portion of the state of Nevada and Alpine county on the east; Alpine and Amador counties on the south, and Sacramento and Placer on the west. Its length east and west is sixty miles, its width thirty miles. It has an area of nearly two thousand square miles. The inhabitants of this county are generally employed in mining and lumbering. Nearly all the cereals, fruits and vegetables are raised in the valleys and on the alluvial flats under cultivation. Nearly one-half of this county would be adapted to agricultural purposes if cleared of timber. The immigrant in search of a farm can obtain one at a small expense—or for nothing—in Placer county by settling on a tract of timber land. The county abounds in good wagon roads and communication with all parts of the state is easy. The climate is pleasant, the soil fertile and large tracts are still open to the agriculturist in search of a farm.

RETURNS OF COUNTY ASSESSOR FOR 1868-9.

Wheat, bush.....	8,466	Butter, lbs.....	133,155

Placerville is the county seat of El Dorado county. It is a city of 4,000 inhabitants. It is 180 miles from San Francisco. It is reached by railroad to Shingle Springs, and thence by stage. The fare is \$10.

Chapter VII, PUBLIC LANDS.

Lands open to pre-emption or private entry—Pre-emption laws—Homestead Act—United States Land Offices.

LANDS OPEN TO PRE-EMPTION.

Are those not yet sold or donated to the State by the general Government. Such land can be purchased at \$1.25 per acre in greenbacks upon complying with the condition of the

PRE-EMPTION LAW.

Approved Sept. 4th, 1861, which provides "that from and after the passage of this Act, every person being the head of a family, or widow, or single man, over the age of twenty one years, and being a Citizen of the United States, or having filed his declaration of intention to become a Citizen, as required by the naturalization laws, who since the first day of June A. D. 1840, has made or shall make, a settlement in person, on the public lands, to which the Indian title had been at the time of such settlement, extinguished, and which has been or shall have been surveyed prior thereto, and who shall inhabit and improve the same, and who has, or shall erect a dwelling thereon, shall be, and is hereby, authorized to enter with the register of the land office for the district in which such land may be, by legal subdivisions, any number of acres not exceeding one hundred and sixty or a quarter Section of land, to include the residence of such claimant, upon paying to the United States the minimum price of such land."

THE HOMESTEAD ACT.

The first Act proved by Congress granting Homesteads was approved May 20th 1862. It provides that; any persons qualified to pre-empt are likewise qualified to apply for and obtain a homestead. Those applying for lands within a railroad reservation are entitled to enter eighty acres; those upon lands outside to 160 acres. Persons applying for homesteads under this Act, may at any time after entry, and before the termination of five years, make proof of entry, improvement, and cultivation, as in pre-emption cases, pay for, and obtain a patent for the land. The initiatory fee is ten dollars and the after expenses for patent from five to eight dollars. The title of the land becomes then vested in the occupant without purchase as in the case of pre-emption. The residence of five years on the land being considered by the Government sufficient to warrant it in donating the land.

UNITED STATES LAND OFFICES.

There are six United States Land Offices in the State of California, one at San Francisco, one at Sacramento, one at Stockton, one at Marysville, one at Visalia, and one at Eureka.

Chapter VIII, PRIVATE LANDS FOR SALE.

Lands belonging to Railroad Companies—Lands belonging to Private Individuals.

LANDS BELONGING TO RAILROAD COMPANIES.

The following Railroad Companies have lands for sale on easy terms and reasonable prices, and particulars concerning the lands can be obtained on application at the offices of the various companies.

The Central Pacific,—Office in Sacramento.
The Southern Pacific,—Office in San Francisco.
The Northern Coast,—Office in Stockton.
The Stockton and Visalia,—Office in Stockton.
The California and Oregon,—Office in San Francisco.

The Western Pacific,—Office in San Francisco.

LANDS BELONGING TO PRIVATE INDIVIDUALS.

Tracts of land both large and small are owned

and for sale all over the State at prices varying from one to one hundred dollars per acre, but as it will be impossible to enter into detail on a subject of such magnitude. We refer our readers to the last chapter in this work. "Suggestions to Immigrants" from which they may learn how to gain reliable information on this important point.

Chapter IX,

RAILROADS.

Railroads Completed—Railroads in course of Construction—Railroads Projected.

RAILROADS COMPLETED.

There are at the present time 1439 miles of Railroad completed in the State as follows:

The Central Pacific from San Francisco to its junction with the Union Pacific at Ogden 880 miles. The Western Pacific from San Francisco to Sacramento 138 miles. The Sacramento Valley from Sacramento to Shingle Springs 48 miles. The California and Oregon from Sacramento to Marysville 52 miles. The California Northern from Marysville to Oroville 26 miles. The California Pacific from Vallejo to Sacramento 60 miles, from Vallejo to Marysville 90 miles, from Vallejo to Calistoga 42 miles. The San Francisco and San Jose 52 miles to San Jose with extension to Gilroy 30 miles. The Wilmington and Los Angeles 21 miles. The San Francisco and Alameda 22 miles. The San Francisco and Oakland 8 miles.

RAILROADS IN COURSE OF CONSTRUCTION.

Only one Railroad is actually being constructed, viz: the California and Oregon of which 40 miles are completed, the work is being rapidly pushed forward and the company is confident of having 150 miles completed before winter sets in.

RAILROADS PROJECTED.

The Southern Pacific Railroad.—To form a communication between San Francisco and San Diego. The exact route is not yet determined upon. The point of commencement will be Gilroy Santa Clara County the terminus of the San Jose Railroad and continue south as near the coast as possible.

The Northern Coast Railroad.—Commencing at Sausalito Marin County in the Bay of San Francisco and running north through the Counties of Marin, Sonoma, and Mendocino to Humboldt Bay.

The Stockton and Copperopolis Railroad.—From Stockton to Copperopolis a mining district in Calaveras County.

The Stockton and Visalia Railroad.—Will traverse the entire length of the San Joaquin and Tulare Valleys passing through the Counties of Stanislaus, Merced, and Fresno to Visalia in Tulare County.

The California Pacific Railroad Company.—Contemplate extensions through Sonoma County viz: Santa Rosa to Healdsburg and eventually to Ukiah and through Colusa County to Princeton and thence to Red Bluff on the Sacramento River.

Chapter X,

SUGGESTIONS TO IMMIGRANTS.

Class of Immigrants needed—Land Matters—Hotels, etc.

Having completed our task of laying before our readers what we believe to be a truthful statement of the wealth and resources of California and the prospects it holds out to the industrious and frugal settler on its soil we conclude by a few words of advice.

First then, we address ourselves to those who labor under the belief that California is a land of gold and plenty, where wages are high, and but little labor is necessary to earn a livelihood.

We recommend such persons to stay away for if they come, and are not willing to work, the community will look upon them as encumbrances and should distress overtake them they will meet with no sympathy.

What California wants is an industrious hard working thrifty population composed of Agriculturists, Vincenturists and Manufacturers with sufficient capital to carry on their several vocations and by so doing add their quota towards developing the resources of the country. No fear need be entertained about hiring mechanics or laborers, for the supply of labor is all the world over equal to the demand. The investment of Capital in industrial enterprises invariably attracts sufficient labor to perform the functions necessary in the premises.

To all who contemplate emigrating to California, the knowledge may be important that it is not a land of drones, but of industrious workers. To the laboring man, the capitalist, the man of active industry, the mechanic and artisan who is looking for a field for legitimate enterprise, the sky, the soil, the mines, the people, will give the kindest and most generous welcome. But for the idle man who expects to live off the industry of others, it is no place—his reception will be cold, and he can neither expect sympathy or tolerance. The country is yet new to human industry, and is a transition state, and requires population, capital and willing hands to develop its resources, when it will become in time, what Nature and manifest destiny have pointed out—the Empire of the Pacific, the most cherished of man and the most blessed of Heaven.

LAND MATTERS.

One of the first things that a stranger who intends to make California his home, desires to know on his arrival is, where to find vacant public lands or lands held for sale by private parties. On the former much has been written by individuals and by the press, efforts have been made by Associations and Societies and Unions to collect information about the public lands and distribute it gratuitously among immigrants and their friends, but up

to this date it is safe to say that no great amount of success has attained any efforts in this direction in placing an immigrant on one of Uncle Sams vacant 160 acres of land.

As a general thing those who know most of the matter of vacant public lands and the various questions of location and entries of the same under the various national and State laws have not been the ones who have written the most on the subject and nearly all that has been written has had a tendency more to mislead than lead aright the searcher after a 160 acre vacant tract.

This kind of knowledge is a special—it can't be acquired on the Street corner nor yet by reading the Newspapers, you cannot learn it entirely at the United States Land Office for their business is limited to selling lands, recording entries, and hearing contests. They know but little of the character of the land, quality of soil, adaptation to that or this crop, and are not put into Office to advise people where or how to go, neither can you learn it from the United States Surveyor General for his duty is confined to surveying the public lands, true he can tell you what his deputies thought of the land when they surveyed it, but nothing from his own knowledge, besides he has not the time even if he had the disposition to go over volumes of manuscript field notes and separate good land from bad for the public and even if he did this he could not tell you what was vacant and what not, and if he did afford you the information you requested of him he would charge you a fee for it. Neither can you learn this information only in part from the State Surveyor General whose duty is confined to the sale and survey of State lands, and there are so many kinds of State Locations that he can't tell to day what lands will be State lands to morrow and he is not the adviser as to the character and quality and vacuity of the same.

In brief there is no short or direct way by which not only the stranger but even an old resident in California can be directed through an easy ordeal to occupy the public domain, but this branch of business is a specialty as much as any other and there are men residing in San Francisco, Sacramento, Marysville, Eureka, Los Angeles and Stockton the seats of the several land offices and other places in the State who keep themselves advised from day to day of the status of the whole land question throughout the State, who note especially each individual tract and the changes and orders in the various land offices, and in the State and U. S. Surveyor General Offices; and who are posted in the State and Federal Land laws governing locations and entries, and who in fact by this means become land brokers and are in our judgment the proper parties to whom applications for the information regarding both public and private lands should be made.

These men constitute a class of Real Estate or Land Agents and Attorneys and who are distributed generally throughout the State playing their calling.

We write in the interest of no man, or firm, or association anywhere but we leave the stranger to find out for himself where his special wants can be best supplied by this class.

The following are the prices of public lands in the State of California,

All lands subject to private entry can be bought at \$1.25 per acre, this kind of land is locateable also with Agriculture College Script, issued by Congress to the States under the Act of July, 1862 limited to three sections in each township and each man can buy all he has the money to pay for. Land is said to be open to private entry when it has been offered for sale by a public proclamation of the President of the United States.

All the even sections within the limits of any Railroad grant and not mineral, are subject to pre-emption in quantities of 160 acres to each man at \$2.50 per acre; a Homestead of 80 acres for \$16 after a five year residence, the rest of the vacant public land surveyed and unsurveyed and not mineral, is subject to pre-emption at \$1.25 per acre or a Homestead of 160 acres for \$16 after five years residence.

A man finding a vacant 160 acres of land, and wishing to make it his home, files in the U. S. Land Office that has jurisdiction over it, a statement in which he sets forth his citizenship and declares his intention to make said land his home, this costs him \$3 fee to file and \$2.50 more if he wants a certificate of the filing, he then improves, cultivates and occupies it and after a continuous residence sufficiently long to show a bona fide say one year, he will be allowed to prove by two witnesses before the Register and receives what he has done since his entry thereon, and if satisfactory, pay his money and get his Patent: but he is not compelled to do this until the land is proclaimed publicly by the President for sale, then he comes in as first purchaser or pre-emptor.

The odd sections in the Railroad grants, are reserved for the Railroad Companies title passing to them when they have complied with the special conditions in their grants. These companies therefore have the sale of these lands and charge according to their value and a title from them is as good as from the United States whenever said lands are listed over and Patented to said Companies.

The State of California has the disposal of all swamp and overflowed Salt Marsh Tide Land, the 16 and 36 sections in each Township, the lands donated her for internal improvements and educational purposes, she sells the swamp and overflowed lands for \$1 Gold per acre and refunds all moneys paid when the lands are reclaimed. It is safe to say that all large bodies and nearly all small bodies of this grant have been sold. Salt Marsh and Tide lands are sold at \$1 per acre, these take capital and time to reclaim and but seldom constitute an investment for agricultural purposes to the small and new beginner.

The 16th and 36th Sections on lands selected in lieu of them are sold at \$1.25 Gold per acre, 20 per cent cash within 110 days of the application and 10 per cent interest on the balance. It is safe to say that there is not a desirable School Section in place of Surveyed lands that has not been either sold or applied for. The internal improvement lands were disposed of some years ago by the issue of School land warrants by the State and sold by her for cash, those not located are on the market in private hands and rate from \$3 to \$3.50 per acre. It is supposed there are only about 15,000, to 20,000 acres of this grant afloat, not located.

The Educational or University lands are sold by the University Agent Gen. H. A. Hegley, at Sacramento for \$5 per acre, 20 per cent cash and ten per cent interest on the balance. This grant was 150,000 acres, about one half possibly has either been sold or located.

Lands where the title has vested in private ownership are for sale by Land agents all over the State, the same as in other States.

Passing from the control of the Mexican to that of the United States Government as California did in 1847, under the provisions of the treaty of Guadalupe Hidalgo with titles of land wholly unadjusted with treaty guarantees that all property landed as others, should be protected, we find ourselves constantly dealing with a set of Laws partly Spanish, partly of the general system, partly of laws enacted for the special laws of California, partly under State Laws, but imperfectly conceived at first, and the subject of constant changes and amendments during the past twenty years; and we ask how under heaven can a man unversed in these several labyrinthine paths walk into California as an immigrant and plant himself securely on a 160 acre tract of land, our reply is, it can't be done without a guide, and it can't be done without being paid for.

The length of this article will not permit us, if it were possible to enter into the minutiae of the land question, but sufficient has been outlined to show any one the absolute necessity of seeking detailed and specific information, regarding land matters, from those who make it their business to acquire it.

HOTELS.

As a stranger on arriving in San Francisco is always beset by Hotel runners, we suggest his making up his mind before-hand, as to the Hotel he will put up at. The three following are respectable and reasonable. The Brooklyn on Bush Street, near Sanson. The AMERICAN EXCHANGE on Sanson Street corner of Halleck and the INTERNATIONAL on Jackson Street between Montgomery and Kearney Streets.

To Eastern Readers.

We fully believe that all the leading and intelligent seeking Mechanics, Manufacturers, Farmers and Miners in the Atlantic States, who venture to subscribe for the SCIENTIFIC PRESS in its present improved standard, will feel more than paid for their \$4 investment. We are adding new names for every issue from various parts of the Union.

The large majority of United States and Foreign Patents granted to inventors on the Pacific coast during the past few years, have been obtained through the agency of DEWEY & Co., publishers of the SCIENTIFIC PRESS. Established in the year 1860, we have an extensive patent library, with full record of cases on this coast, and can give the best and most reliable advice as to the patentability of new inventions.

TO MINERS, MILLMEN AND METALLURGISTS. Kustel's new work on the Concentration of all kinds of Ores, and the Chlorination Process, for Gold-bearing Sulphurets, Arseniurets, and Gold and Silver Ores generally, is the best and most complete work issued. It contains 120 diagrams, illustrating machinery, etc., which alone are of the greatest value. Price, \$7.50, postage paid. Published by Dewey & Co., publishers of the Scientific Press, San Francisco.

ENGRAVING ON WOOD DESIGNING AND ENGRAVING on wood and for electrotype cuts of every description, done by superior artists at the office of the SCIENTIFIC PRESS. Fine Cuts made for Book and Newspaper Illustrations, and for Fancy Labels for printing in various colors; Monograms, Seals, etc., etc. Prompt execution and reasonable prices.

DEWEY & CO.,
No. 414 Clay street, S. F.

250,000 ACRES

Of Wheat, Vineyard, Fruit, Dairy and Grazing Lands,

FOR SALE BY

E. R. PERRIN,

530 California Street, San Francisco.

These lands lie in Shasta, Mendocino, Colusa,

Napa, Sonoma, Santa Clara, San Joaquin,

Merced, Fresno, Tulare, Kern, San

Luis Obispo and Los Angeles

Counties.

SAN JOAQUIN VALLEY LANDS.

Much of this land in the San Joaquin Valley is admirably adapted to the cultivation of grain, admitting of the use of machinery.

DAIRY, FRUIT AND GRAZING LANDS.

A large portion is all that could be desired for Dairy purposes, with plenty of wood and water, while the remainder is well suited for the Vine and the different varieties of Fruit, or for Grazing purposes.

Much of the above land having been purchased at Government prices, will be sold to actual settlers at figures varying from one dollar and fifty cents (\$1.50) to five dollars (\$5.00) per acre, while great inducements as to price and time will be offered to buyers of large tracts.

ALSO

A few Mexican Grants at prices ranging from seventy-five cents to one dollar and fifty cents per acre.

BLAKE'S PATENT STEAM PUMP.

THESE PUMPS

Have been tested, and found to be indispitably without an equal wherever tried. They are constructed in the most simple style, and built in the most thorough manner—especially calculated for SIMPLICITY, DURABILITY and POWER.

Some of the advantages of the Blake Pump may be summed up as follows: It is POSITIVE UNDER ANY PRESSURE. May be run slow or fast as may be desired. Will discharge more water than any others of the same dimensions. Has no leaky joints, the steam part being cast in one entire piece. The steam valve is perfectly balanced, is cushioned at each end, and slides with the greatest facility. Will start at any point of the stroke, and will discharge all the water of condensation.

The Pump has no crank or fly-wheel, thereby saving a considerable item of expense to the purchaser. Having no wear points, it therefore needs no watching, and is consequently ready to start without using a starting bar or any hand work whatever. The Blake Pump is extensively used

On Railroads and Steamboats; in Hotels; for Mining and Fire Purposes; in Breweries, Tanneries, Sugar Houses, Factories, Mills, Laundries,

And as BOILER FEEDERS, wherever steam is employed. In fact, wherever water or other liquids are desired to be raised in large or small quantities, or against heavy or light pressure, it is the

Cheapest and Best Pump that Can be Used.

It is offered to the public as the most perfect independent Steam Pump ever invented. TWELVE DIFFERENT SIZES are made, capable of throwing from 1,000 to 180,000 gallons an hour, and adapted to any class of work that might be required. For sale by

BERRY & PLACE,
112 and 114 California Street, San Francisco.

Every pump will be warranted to perform the work required of it by the purchaser, or it may be returned and the money will be cheerfully refunded.

Awarded a SILVER MEDAL at last Exhibition of Mechanics' Institute, San Francisco, as being the Best Pump on Exhibition.

THE AMERICAN SUBMERGED PUMP.

Has no leather packing, is composed entirely of metal, rendering it less liable to get out of repair than the ordinary packed pumps. It is admirably adapted for Irrigating purposes and for Watering stock.

As a Safeguard against Fire it has no Equal,

One of the medium size being capable of protecting an ordinary frame dwelling. In short it is an article that

Every Farmer should have on his Premises.

PRICE LIST.

No.	Capacity	Material	Price	Gallons per Hour

" 1.	1,000 to 1,200	Iron Galvanized	\$17	
" 2.	2,000 to 2,500	"	"	"
" 3.	4,000	"	"	"

Larger sizes made to order of any required capacity. Hand power.

MANUFACTURED AND FOR SALE BY

PACIFIC PUMP MANUFACTURING COMPANY,
City Agents, - - - **WILSON & DIXON,**
Plumbers and Gas Fitters, 318 Pine Street, San Francisco.

Information to Immigrants.

The California Immigrant Union was established by a number of the most prominent business men of San Francisco, for the benefit of new comers to our State, and to attract hither an agricultural population.

The officers of the California Immigrant Union, at its central office, No. 316, California st., in this city, are prepared to furnish to new comers or those who desire to come to this State, such information as they may require concerning the land laws and regulations and the public lands in the State of California, and how and where they may be found, and to recommend them to suitable persons in the different counties and districts, from whom they may obtain such special and local information as they may require to facilitate their movements. They will also furnish, personally, to applicants, or by letter, reliable information concerning the prices of private lands, in the different counties and districts of the State, and the terms upon which they may be purchased.

Maps and diagrams, showing the location of lands of all classes for sale in different portions of the State, may be examined at the office, No. 316, California street, below Sansome, and such information as may be required concerning the modes of reaching them, etc., will be furnished whenever necessary. Official and other reliable information concerning the different counties is always on hand, and open to the examination of those who desire it, or will be obtained for them, if accessible, without charge.

All letters and communications, addressed to the CALIFORNIA IMMIGRANT UNION, requesting information concerning this State, by persons who are considering the propriety of coming to California to engage in agriculture, will be promptly answered, and, if possible, the required information furnished. The pamphlet published by the California Immigrant Union, entitled "All About California and the Inducements to Settle There," printed in English and in German, has already been sent to nearly every U. S. Consul in Europe, England, Scotland, Wales, Ireland, Canada, Nova Scotia and Australia, and to many of the public libraries in those countries. It has also been sent to every agricultural society library and most of the other public libraries in the United States, where copies may be found and read by those who have not already seen it and are interested in its contents.

Any public library or reading room not already supplied, will be furnished gratis with copies upon request, and its officers will be pleased to receive such applications. It may also be obtained of the American News Co., 117 Nassau St., New York, of Hiram Dixon, No. 8 Battery Place, New York, of Messrs. Geo. A. Croft & Co., 21 Park Row, New York; publishers of the Great Trans-Continental Railway Guide, of John R. Schulten, No. 5½ North Street, Baltimore, at Mr. J. Budd, of the office of the Omaha and North-Western Railway Company, Omaha, and of the Agents of American News Company on the Eastern Railroad lines.

It is published for gratuitous circulation and will be forwarded upon request, to all who may feel interested in its contents, on receipt of the address. The information it contains is of precisely the character needed by emigrants, concerning the climate, soil, and resources of California, and the mode and cost of getting here, the prices of land, land laws and regulations, and various other matters of interest to the emigrating classes. It is entirely reliable, and much of the information it contains is official in its character, and all may be depended on with entire confidence. It covers most of the ground usually gone over in correspondence, and was compiled with express reference to that purpose.

Californians visiting their friends in the Eastern States or Europe, are advised and invited to provide themselves with copies of the pamphlet, that they may be able to answer satisfactorily the numerous questions addressed to them, and place inquirers in communication with the officers of the association. When requested by letter, copies will be forwarded to such useful addresses as may be furnished, whether of individuals, or public libraries or reading rooms that may be found unprovided.

Public spirited men in all parts of California, who desire to aid this useful work, and land owners who desire to dispose of their own land, and to see the neighborhoods around them settled and improved, are invited to become members and contributors to the funds of the association,

THE KIMBALL MANUFACTURING COMPANY.

MANUFACTURERS OF ALL KINDS OF

CARRIAGES, LIGHT BUGGIES, FREIGHT WAGONS, STAGE WAGONS,

COUNTRY AND FARM WAGONS. ALSO THE CELEBRATED

Wood C Spring & Thorough-Brace Buggy, with their Patent Steel Plate Axle.

COR. FOURTH & BRYANT STREETS, SAN FRANCISCO, CAL.

THE WOOD C SPRING THOROUGH-BRACE WAGON, is the lightest, most durable and Reliable Wagon ever made, and the best evidence of their qualities is the fact that out of 1000 of these Wagons now in use we have never had one returned on our hands.

THEY REQUIRE NO REPAIRS.

They are easy for Horse and Man. They will carry weight. They are lighter than any Wagon of their size and dimensions ever made. The Patent Steel Plate Axle never requires setting.

A full sized Wagon to carry two heavy men, weighs but 200 pounds. Wagons of any other make, of the same size, will weigh 300 pounds.

TROTTING AND LIGHT WAGONS FOR TWO PERSONS WEIGHING 160 POUNDS.

TROTTING WAGONS FOR ONE PERSON, WEIGHING 125 POUNDS.

ALL THIS WORK IS WARRANTED!

The KIMBALL MANUFACTURING COMPANY have the Largest Carriage Manufactory west of New York City, if not in the United States and the Largest Assortment of Carriages and Wagons.

CALL AND SEE FOR YOURSELVES!

The Axles, Combination Perch, and C Springs, used in these Wagons, are patented, and all infringement will be promptly prosecuted.

or local agents or friends to whom new comers, who desire to settle near them, may be sent to obtain such information as they require, concerning public and private lands in the vicinity.

The officers and agents of the California Immigrant Union, will, whenever desired, arrange for cheap transportation of passengers, who may move together in companies, by railroad or steamship, from European or Eastern ports, or from any point in the United States, to California, and also in this State, all the transportation companies being favorably disposed toward our organization, and willing at all times, to further its objects in the most liberal manner. It will also purchase and secure passage tickets, and make remittances of funds to families, and persons in the Eastern States and Europe whom it is desired to bring hither, on the lowest possible terms.

Investigations will be made concerning the title to real estate, and reliable abstracts of title, and legal opinions, thereon procured and proper conveyances drawn for the satisfaction and security of purchasers. It is also offering for sale, quantities of private lands, in tracts to suit purchasers, on very liberal terms of payment, and at prices ranging from one dollar and fifty cents, to ten dollars per acre, and improved farms at prices varying according to the location, and amount of improvements existing. All services rendered to immigrants, are entirely gratuitous. Send for copies of the pamphlets, and address by letter or call personally, upon the officers of the CALIFORNIA IMMIGRANT UNION, at the Central office, No. 316, California street, San Francisco.

Officers of the California Immigrant Union: President, C. T. Hopkins; First Vice President and Manager, C. S. Capp; Second Vice President, Charles Crocker; Vice President Central Pacific Railroad; Third Vice President, L. Gottig; President German Savings Bank; Treasurer, J. Seligman & Co., bankers; General Agent, W. H. Martin.

On the Central Pacific.

[Written for the Scientific Press.]

Being desirous of visiting our neighbors of Utah, who are at once a wonder and a mystery to so many of our friends, and having swallowed a sufficient quantity of San Francisco sand, I have just come on to Ogden, and write to acquaint you of the fact, knowing the interest you take in my movements. I came on here, via the Western and Central Pacific roads, and intend now to travel about this territory that I may see with my own eyes and hear with my own ears what is here going on.

I might dwell at length on my journey thus far;—how I traveled along the pleasant Alameda valley, where the farmers were threshing their wheat, whirled down the heated San Joaquin Plains, past thriving Stockton and up to sunny Sacramento;—how I traveled up, up, up, past Auburn with its quartz and placer mines, where untold sums are still waiting for Von Schmidt's pipes to again make the place blossom like a rose, past Colfax, where our Eastern visitors ought to stop, to view the mining wonders at stage-connected places;—how I rode by Cape Horn on the observation car, gazing in admiration at the sublime scenery;—how I passed Gold Run and Dutch Flat, rattled through snow-shed and tunnel, surmounted the summit, and rushed down past the beauties and aridities of Nevada, her great promises and her achievements, till I have traversed the whole width of the state and reached this point of junction (Ogden) of the two parts of the great trans-continental highway. I might, but I won't.

I look back now with wonder at my journey. In forty-six hours and enjoying every comfort, I have traveled a distance where formerly months were necessary for the trip, and grievous sufferings, even unto death, were to be encountered. I think that certainly everyone who has crossed the plains with an emigrant train, ought now to traverse the line in the comfortable, as well as elegant, cars which the C. P. provides. I don't know but what it would be a good idea for the company to give all such a free ride to and fro, that they may appreciate what has been done. When I

see the enormous heights to be scaled, the deep ravines to be crossed, the long cuts and tunnels, I cannot help admiringly wondering at the energy and perseverance of those who have accomplished this enormous undertaking. They have brought to our State life and strength. They have developed the mines, opened up the broad fields and made of great value that which otherwise would be worth nothing. When others pronounced the work impossible, they persevered, and now they deserve great rewards. The State of California—the whole Coast, in fact—is deeply in debt to the railroad. Of course their work was not a mere deed of philanthropy. They expected large returns and now they are commencing on their harvest. That, however, by no means lessens the credit due them. The confidence they had of our future and the benefits we have received from that confidence remain the same.

The company still shows a most obliging spirit in its dealings. It provides every comfort, it continually reduces the charges as fast as it can, it makes experiments in transporting fruits, grain, etc., for our advantage as well as their own. Many complain because they have taken off the Pullman cars. Well, let these grumblers look at the enormous wear and tear of running these tremendously heavy vehicles; let them remember that there are now palace cars on the line which are almost, if not quite, as comfortable; that the company has these cars built in our State, adding thereby to her wealth and giving employment to many of her sons. Let them meet the officers of the company, ride over the line, see the great deeds accomplished and witness the kindness and courtesy which is shown on all sides. After personally experiencing all which has been done and is now being performed for their sakes, if they do not have a kindly feeling towards the road, at once the foundation and the crowning glory of our advancing prosperity—no matter what the motives of the company may be supposed to be—then they deserve to be cut off from the advantages of the road, to be obliged to cross the mountains and plains in teams, or to ship their freight by steamer, by horse-power or by any other means they can find.

But I am getting pathetic, I find, and therefore think it time to stop. Will keep you informed of my movements and will write you all about Utah. W. H. M.
Ogden, Aug., 1870.

ROASTING OF GOLD AND SILVER ORES AND THE EXTRACTION OF THEIR RESPECTIVE METALS WITHOUT QUICKSILVER.—By G. Kustel, San Francisco, Dewey & Co. 1870, 12 mo Pp. 150.

The main purpose of this book is to explain the bleaching process for extracting silver from certain ores. Invented by Kustel and Hoffman, and successfully practiced by the latter in Mexico. Several years ago we described the main features of the process, but in this book, a number of new details adapted to different ores and circumstances are given. As roasting precedes bleaching, that is fully treated. The book is worthy of Mr. Kustel's reputation as one of the first metallurgical authorities of our own age, and it will be of service to all who study the methods of extracting the precious metals on this slope.—Daily Alta.

LITHOGRAPHIC

ESTABLISHMENT

OF

GEO. H. BAKER,

408 CALIFORNIA STREET.

Bonds, Certificates, Bills of Exchange, Maps, Labels, and every description of Ornamental or Commercial work.

FITCHBURG LOTS, 50X100.

Situated between Alameda and
SAN LEANDRO.

On a credit of 10 years, on payment of 6 percent per annum interest and five dollars a lot yearly for improvements first five years. Both lines of Railroads cross the property, stations central, not one hour's ride from San Francisco. Streets will be graded, and 5,000 shade trees will be put out on the property and kept growing at expense of seller. An abundance of good soft water obtainable at a depth of 16 feet. For plans and further information apply to

HENRY S. FITCH,
506 Montgomery Street,

THE SCIENTIFIC PRESS.—An Illustrated Pacific States weekly, devoted to mining, farming, mechanic arts and industrial progress, generally, but especially in the west. This work is published in San Francisco, at \$4 per annum. Mr. M. is here to canvass for subscribers, with specimens of the work, which we can commend to our readers—the general public.—*Desert Daily News, Salt Lake.*

THOS. H. SELBY & CO.

Nos. 116 and 118 California Street, San Francisco.

SHOT TOWER
AND
MANUFACTORY
OF
PLUMBING GOODS
OF ALL KINDS,
CORNER
HOWARD AND
FIRST STREETS,

SMEETING,
SEPARATING
AND
REFINING WORKS
FOR
SILVER
AND
LEAD,
NORTH BEACH.

IMPORTERS OF
BAR & PLATE IRON, CAST STEEL, SHEET COPPER, ZINC,
AND ALL KINDS OF
Plumbing Goods, and manufacturers of Lead Pipe,
SHEET, LEAD, DROP SHOT, &c.
ALSO PROPRIETORS
Of the Selby Lead and Silver Smelting Works, of San Francisco.
Crude Lead and Silver Bars Purchased.

SPECIAL NOTICE.

THE "SELBY LEAD AND SILVER SMELTING AND REFINING COMPANY" having made large additions to their Works, are prepared to receive in any quantity, Lead Bullion containing Silver and Gold, Returns in all cases, will be made promptly in twenty days from the receipt of the bullion in San Francisco.
Returns from Galena ores containing Silver will be made within thirty days from delivery in San Francisco. These ores should be concentrated so as to assay fifty per cent. in Lead.
They are also increasing their Works for the reduction of rich Silver ores. This addition Will be completed about the 15th of September.
Freight and shipping charges advanced on shipments to these Works, provided the amount does not exceed the net value of the shipment.

PATENT GARDEN SPRINKLER
AND PORTABLE FOUNT.

This is the best Garden Sprinkler in use for large plats. It spreads over a large space evenly and falls upon the ground like rain, and will not hurt the most delicate plant or flower. It is portable and easily moved from place to place, thereby making them a luxurious treat in a warm climate, by setting one down on the windward side of you at your repast and rest. Every Farmer in this warm climate should have one, that has pressure of water from tanks or otherwise. They are substantially made and not liable to get out of order, and cheap—the price being five dollars each. The above cut will convey the idea at once of their superstructure. Their weight being about five pounds, they can be used like a hose-pipe, in hand when wanted.
I also have Cast Pent Stocks, or Hydrants; price, \$3 50 each. PUMPS, assorted kinds, and

MANUFACTURER OF

Well Piping, Tin Roofing, Guttering Laying Water Pipe,
Plumbing, Gas Fitting and General Jobbing.

ALSO MANUFACTURE THE HENRIKSON PATENT VENTILATING CHIMNEY TOP,
THE FINAL RESORT WHEN ALL OTHERS FAIL. It cures a smoky chimney and ventilates a house. The BEST AND CHEAPEST IN USE. They cause a draft that dispenses with high stacks or chimneys; doing away with Blowers for large Steam Mills.

Metalic Life Boats of superior build at Eastern Prices.

L. D. HERRICK.

9v21-1am3m

666 Mission Street, bet. 2d and 3d, San Francisco.

Rails, Newel Posts,

AND BALUSTERS.

Constantly on hand for sale, and shipped, together with all kinds of

TAIR WORK,

To any part of the coast. Practical workmen sent, when desired, to put up the same.

Work Warranted to Fit by simply sending a correct ground plan of stairs, together with height of story.

Wood Turning and Scroll Sawing of all kinds promptly executed. Spanish Cedar, Walnut and California Laurel always on hand for sale.

Langland & Cameron,
STAIR BUILDERS,
809 Market street,
And 453 and 457 Brannan street,
SAN FRANCISCO.

Prospectus—July 1, 1870.

It is hardly necessary in commencing a new volume, as we do to-day, to remind our readers that we are constantly pushing forward in our efforts to improve the SCIENTIFIC PRESS. We have never relied upon promises of what we propose to do; but have always been able to point to what we have done in the past, as the best assurance of what is in store for the future.

At the opening of the present year we reduced the price of the paper from \$5 to \$4 per annum, believing that the modified condition of affairs on the Pacific slope, growing out of the opening of the Overland Railroad, and other facilities for more frequent intercourse with other portions of the world, fully warranted such a step. Our anticipations have been more than realized in the increase of subscriptions, so much so as to enable us to give an additional amount of reading matter.

Illustrations.

We have also made such arrangements as are now enabling us to greatly increase the number, interest and variety of our illustrations. While this improved feature adds largely to the cost of publication, we feel confident the additional interest and value thereby given to our columns, will be duly appreciated by a discerning public.

The Miner, the Mechanic, the Inventor, the Farmer and the Naturalist, will all find something of constant and practical interest in this direction. The Miner will always be presented with everything new in the way of reducing ores, whether by mill process or by smelting.

All important improvements in Machinery will be promptly presented to the Mechanic, while the Inventor will be as regularly furnished with hints and stepping stones upon which others have mounted, and from which he in turn will be able to see still further and more clearly into the undivided future.

The ideas and instructions that we are here constantly placing before the Farmer will speak for themselves. If the reader will pardon us for a mere hint at the future, we venture the promise that no one thing that is new and of any real practical importance in the mechanics of Agriculture shall be omitted in that portion of our illustrative department.

The Naturalist too will now and then find something to interest and instruct; while the general reader is never forgotten.

How far we have succeeded in making the SCIENTIFIC PRESS acceptable to the public, we can only judge by the words of hearty commendation which we are constantly receiving, not only from our brethren of the press, but from an innumerable private letters, from the readiness with which our patrons pay up their annual subscription and from the rapid increase in the list of subscribers.

A reference to the index published in our last issue affords the best evidence of the wide field of research and instruction in which we are engaged. The present number affords ample evidence of the truth of what we have written, and to strangers our subscribers can fully attest that the present is but an average of our issues on the first of each month.

The carefully digested mining summary which we give each week; the chronicles of scientific and mechanical progress; the large and varied information on agricultural matters, and the many matters of general and special interest, together with the numerous illustrations, in all the various departments, combines an amount of information which for value, interest and variety, will not suffer in comparison with any periodical of the day.

We trust that those for whom the Press is published will exert themselves to enlarge its sphere of usefulness by extending its circulation, and thus strengthening the hands of the publishers for still greater efforts, feeling satisfied that the benefit will be mutual.

July 2d, 1870.

PATENTS ON THE PACIFIC COAST.—To those of our friends who desire to keep posted upon inventions upon the Pacific coast we say, subscribe for the SCIENTIFIC PRESS, published by Dewey & Co., San Francisco, Cal., at \$4 per year. The opening of the railway across the continent has given to all patents a much higher value in that portion of our country known as the Pacific slope, and all interested will find the paper above alluded to a valuable reference. *Mechanic and Inventor, Detroit, Michigan.*

NEW VOLUME.—The San Francisco SCIENTIFIC PRESS has entered its 21st volume, and is one of the most valuable journals published. Containing, as it does, articles on every branch of home industry, the sciences, arts, etc., the Press should find its way into every hamlet in the land. The four dollars expended for a year's subscription to this journal may be repaid by the information gained by the perusal of only one number. *Alpine Chronicle.*

The Scientific Press is devoted specially to matters of machinery, inventions and processes pertaining to the development of mines, and gives free and full discussions of such matters. Terms, \$4 per year. *White Pine News, May 4th.*

SCIENTIFIC PRESS.—The Mining and Scientific Press, which has been a faithful exponent of the scientific, mechanical and industrial interests of our western coast, entered upon its twentieth volume on the first of January, and at the same time adopted the shorter and equally comprehensive title of Scientific Press. This journal has, for some time past, maintained a department specially devoted to agricultural matters, and has filled it with useful and interesting information. *Contra Costa Gazette, Jan., 1870.*

A VALUABLE BOOK FOR INVENTORS AND ARTISANS.—Dewey & Co., publishers of the SCIENTIFIC PRESS and Patent Agents, have just issued a neat little volume of over five hundred well executed cuts of the principal mechanical movements known. These useful representations of the various appliances of power are printed side by side with explanatory notes, which makes the subject clear to every reader. Such a book should be in the hands of every mechanic, and form part of every public school library. It is a handy book, and cheap enough for every farm, shop and factory. Sent to any address from the SCIENTIFIC PRESS office, postpaid, for \$1. *New Age.*

DEWEY & CO.

American and Foreign

Patent Agents.

Scientific Press Office, 414 Clay Street,
SAN FRANCISCO.

Patents Obtained Promptly.
Convents Filed Expeditiously.
Patent Reissues Taken Out.
Patents Secured in Foreign Lands.
Assignments Made and Recorded in Legal Form.
Copies of Patents and Assignments Procured.
Examinations of Patents made here and at Washington.

Examinations made of Assignments Recorded in Washington.
Examinations Ordered and Reported by TELEGRAPH.

Rejected Cases taken up and Patents Obtained.
Interferences Prosecuted.
Opinions Rendered regarding the Validity of Patents and Assignments.

Every Legitimate Branch of Patent Agency Business promptly and thoroughly conducted.
ILLUSTRATED CIRCULARS FREE.

Interferences.

INTERFERING APPLICATIONS are conducted with spirit and ability on the most favorable terms, by DEWEY & CO. It sometimes happens that an applicant finds his invention has been patented by another, but more recent discoverer. In such cases the prior discoverer can obtain full right to the invention if he can produce tangible evidence of priority.

When patentees are threatened with interference they should consult able and responsible agents before they either allow themselves to be backed down from their rights, or trespass upon the rights of others. We will always counsel and advise in such cases upon the most reasonable terms—often saving clients heavy damages and exorbitant fees.

Advancing Cases.

If any case placed in our hands meets with rejection, we do not wait to write and inform the inventor of this fact, (as is the case with most agents,) but our representative at Washington proceeds at once to examine the stated objections, and if it be not a just and unavoidable decision, the claims of the inventor will be persistently argued before the Examiner, and if possible the decision reversed.

Reasons for Success.

We would especially call the attention of the inventive public to the fact that our Patent Agency is taking out a larger number of Patents than any other agency west of the Mississippi River. We do our work promptly and thoroughly, and refer to our standing amongst inventors as an evidence of our success in our special department. Our work is all done inside of our office, BY COMPETENT AND RELIABLE PERSONS, who have been for years interested and associated with us. We therefore are not compelled (like many agencies) to trust valuable and important inventions prematurely to outsiders, to have part of the case prepared, but inventors can depend that, from the time their cases are first placed in our office, they are kept with proper secrecy until full rights are secured in the Patent Office in Washington. This is an important point in the proper prosecution of Patent business. It is a notorious fact that some prominent agencies trust a considerable portion of their cases to apprentices and amateurs. A deficiency or want of attention to the small details of any kind of business will often prove as harmful as a flagrant violation of the most important rules which govern and control it.

DEWEY & CO.,

below Sansome, San Francisco.

BOOK ON EARTHQUAKES.—A Treatise on Earthquake Dangers, Causes and Palliatives, by Prof. Thomas Rowlandson, comprising Earthquake Dynamics; Earthquake Waves, Sound that attends Shocks, Lime, Mortar, etc., Cosmogony and Seismogony, Phenomena of the Neapolitan Earthquake of 1857, and General Observations respecting Structural Arrangements. Published by Dewey & Co., Scientific Press Office, San Francisco, 1869, containing 96 pages. Price, 50 cents; postage free.

LAYRES' ELEMENTS OF COMPOSITION.—This is a valuable book of 166 pages, containing plain and simple instructions in the art of composition. It should be read by all intelligent persons who desire to write or speak English correctly or eloquently. Printed and sold by Dewey & Co., Scientific Press Office.

SCIENTIFIC PRESS, FROM SAN FRANCISCO
This Mining, Farming and Mechanic Arts Journal, after a most singular absence from our table, has again made its appearance and is heartily welcomed. It is the recognized mining organ of the Pacific coast, and rightly so, since it is conducted ably and honestly in all respects. It scorns humbug and avoids all merely speculative commendations of sudden discoveries in the treatment of ores. The reliability of the Press in all matters pertaining to mines and mining news, makes it a most desirable paper for our people here. Per annum, \$4. *Colorado Herald, July 6th.*

HOME, SWEET HOME.

'Mid pleasures and palaces,

"Live and Let Live,"

Is a good old adage, and we shall adopt it as our own. We do not pretend to do work at "less than cost," as some people advertise to do; but we do claim to do all kinds of printing as cheap as it can be done on this Coast—and we believe as cheap as it is done in Chicago. Customers, in the country or city, are invited to call in person at our office, or send their orders by mail or express, and they will be fairly dealt with.

SPAULDING & BARTO.

Scientific Press Office,
San Francisco.

THE SCIENTIFIC PRESS now stands at the head of such papers on this coast, and is for miners, mechanics, and farmers, a most valuable journal.

It is a 16 page journal, contains the latest and most reliable news from every mining section of the Pacific; gives full descriptions with engravings of every new and valuable mechanical invention, devotes considerable space to the agriculturist, horticulturist, and florist, and keeps its readers well posted on all the facts and improvements in the arts and sciences.

Mr. M. is canvassing this Territory for subscribers at four dollars per annum, and we cordially recommend the SCIENTIFIC PRESS to our citizens and welcome it to our exchange list. *Boise City Chronicle.*

Free Information for Inventors and Patentees.

Our Patent Office Circular, relating to U. S. and Foreign Patents, Caveats, Patent Laws, Rights of Inventors, Valuable Hints, Illustrated Mechanical Movements, etc., comprises 48 pamphlet pages, embracing the following

List of Contents:

Advancing Cases; Advantages, Important; Assignments, Forms, Cost, etc.; Caveats of what they consist; Form of Cost, how Filed effectively; Cost of Obtaining Patents; Confidential Advice; Copies of Patents Assignments, etc.; Copyrights; Dangers of Delay; Designs, Patents for; Engravings and Illustrations; Enche; Condensing Beam—Illustrated; Extension of Patents; Foreign Patents—all Countries; Foreign Inventors; Hints to Inventors; Government Fees, List of; Home Counsel; How to Obtain Patents—Steps Necessary; Hydrostatic Press—Illustrated; Interferences; Influence at Washington; Laws (U. S.) and Decisions Relating to Patents; Lathe, Engine—Illustrated; Letters Patent—of what they consist; Library, Reports, Law Books; Locomotive Engine—Illustrated; Medicines or Compounds, Patent for; Mechanical Movements—Illustrated; Mining and Scientific Press Office; Processes, Patents for; Record of Pacific Coast Patents; Reissues; Rejections—Cause and Remedy; Reports of Patent Office; Rights and Privileges of Inventors and Patentees; Saving of Time; Self-evident Facts; Selling Patent Rights; Springs, Various Kinds—Illustrated; Stamp Battery; Quartz—Illustrated; Telegraph, Patent Business by; Unsuccessful Applicants; Who can Obtain Letters Patents; What Claims can be Patented; Worthless Patents, Candid Reasoning.

This pamphlet will be furnished free on receipt of postage stamp. Confidential advice given, and every legitimate branch of Patent Soliciting business promptly and faithfully executed by

U. S. and Foreign Patent Agents, Scientific Press
Office, 414 Clay street, San Francisco.

Illustrate your Inventions

IN THE SCIENTIFIC PRESS,

An illustrated journal of Mining, Farming, Mechanic Arts and Industries on the Pacific Coast. It costs no more for a superior engraving by our experienced artists than is usually charged for a less perfect picture. If you wish to introduce a new invention properly before the public, the first steps in so doing are important ones. A full description and correct representation in the Press will go farther and prove more quickly effective than any other means.

The fact that an illustration is admitted into our columns, guarantees the invention important consideration in the minds of thousands of the most intelligent readers—at home and abroad—who would not notice it so favorably or so thoroughly, if at all, when presented through an unreliable medium or indifferent source.

The model of an invention sent to us is sufficient for making a good engraving. Sometimes a photographic view is sufficient; but it is always best accompanied with drawings or a copy of the patent. A first-class illustration has proved to be one of the best and cheapest means of obtaining purchasers for a good machine or a valuable patent.

Cuts ordered for illustration are the property of the inventor who pays for them, and can generally be used for circulars, pamphlets, books, or other newspapers. The engravings to be seen in each issue of the SCIENTIFIC PRESS are a fair sample of the work of the artists who can always be found in our office.

DEWEY & CO.,

Publishers Scientific Press, American and Foreign
Patent Agents, San Francisco.

IMPORTANT BOOK!

JUST ISSUED.—Roasting of Gold and Silver Ores, and the Extraction of their Respective Metals without Quicksilver. By G. Kustel, Mining Engineer and Metallurgist; Author of "Nevada and California Processes of Silver and Gold Extraction," and "Concentration of all Kinds of Ore."

Illustrated by numerous engravings. Published and sold by Dewey & Co., proprietors SCIENTIFIC PRESS, San Francisco.

This Book contains 120 pages. Price, \$2.50, gold, or \$3 currency, postage paid.

TREATMENT OF REBELLIOUS SILVER ORES, by Charles H. Aaron—a pamphlet of eight pages of concise reading, of practical value to parties interested in the subject. Printed and sold by Dewey & Co., at this office, for 25 cents, post paid.

THE SCIENTIFIC PRESS.—Mr. W. H. Murtry, special traveling agent for the Scientific Press, is a very sociable and pleasant gentleman. He speaks in high terms of the mineral resources of Owyhee, and predicts for our camp a bright future. After examining the mineral and agricultural resources of Idaho, he will proceed overland to Montana and Colorado. He has secured quite a large list of subscribers for the Scientific Press, which is devoted to mining, farming and the mechanic arts, and is inferior to no publication of the kind in the United States. *Avananche, June 18th.*

500,000 ACRES FARMING LANDS.

Strangers calling at his office will be fur-

nished with Maps of the State, and all de-

valuable information connected with farming

in California.

[illegible]

SAN JOAQUIN VALLEY GRAIN LANDS,

FOR SALE ON A LIBERAL CREDIT BY

JOHN T. LITTLE,
No. 1 STEVENSON'S BUILDING,

S. W. COR. CALIFORNIA AND MONTGOMERY STREETS.

TITLE-UNITED STATES PATENT:

These lands were all selected by competent persons, as first class wet lands, and are now offered to parties desiring to occupy them, in quantity from one-half section upward, at a price of \$100 per acre, and on a liberal credit. The valley of the San Joaquin is the wheat region of the State, and is destined to become the granary of this coast. * Wheat there is never liable to be destroyed by rust, as it often is on good lands near the coast, and there is exposed to fogs and high winds. The soil is a rich sand beam of great depth, and is perfectly suitable. It is claimed to be superior to the average farming lands in the State, and is inexhaustible to land in other locations that is held at \$40 to \$70 per acre. None of it is for grain, and the surplus is suitable for stock raising and for all kinds of vegetable fruits and berries. The land is well covered with wild clover and alfalfa. There are numerous creeks, and good water can be had by sinking a moderate depth upon any section of either sect. The Stockton and Vallecito Rail Road, and the Southern Pacific by its last survey, will pass through a part of this coast. * With present facilities, the cost of transporting wheat to San Francisco is but \$3 per ton, which rate will be materially reduced upon completion of either of the above rail roads. California has been pictured as the vineyard of the world, and future years will verify the promise. In no part of the State does the grape grow so well as in this section. The grapes are of the best quality, and the vines are well adapted for the production of wine. The valley rail Road are completed, and the road will be in operation through these lands in time for the next harvest.

*Patents and Inventions.***A Full List of Patents Issued to Pacific Coast Inventors.**

[FROM OFFICIAL REPORTS TO DEWEY & CO., U. S. AND FOREIGN PATENT AGENTS, AND PUBLISHERS OF THE SCIENTIFIC PRESS.]

FOR THE WEEK ENDING AUGUST 23D.

ROASTING FURNACES FOR ONES.—John Col-
lom, Empire City, Colorado Territory.

BALEINO-PRESS.—Courad Locher, Oroville,
Cal.

BUCKET FOR PADDLE-WHEELS.—Alfred C.
Lord, San Francisco, assignor to himself
and W. J. Millor, same place.

REFINING-SHEARS.—Enoch J. Mareters,
Shaw's Flat, Cal.

FRUIT-CODER.—Enoch J. Marsters, Shaw's
Flat, Cal.

NOTE.—Copies of U. S. and Foreign Patents furnished
by DEWEY & CO., in the shortest time possible (by tele-
graph or otherwise), at the lowest rates. All patent
business for Pacific coast inventors transacted with
greater security and in much less time than by any other
agency.

Notices of Recent Patents.

DESIGN FOR SEAL STAMP.—J. F. Pages
S. F. After having served for centuries to
embellish the pages of history and of nar-
rative, the sphynx is now brought to serve
the practical purpose of a design for a hand
stamp, for which, it may be said, it is par-
ticularly adapted and appropriate. Mr.
Pages has chosen this as the design on
which he has obtained a patent. The figure
is that of a human head, surmounted by a
heavy cowl or hood, placed on the body of
a lion. The peculiar conformation of this
figure is particularly well suited for the
purpose on account of the disproportion of
weight between the front and rear parts.
Moreover, the broad surface presented by the
cowl is well adapted for striking with the
palm of the hand, in order to give the im-
pression. It might have been thought
that the appropriateness of the design would
have been appreciated long ago; but it
was not, and Mr. Pages is now proprietor
of the idea.

BEVERAGE.—A. S. Taylor, S. F. Probably
there are but few within a reasonable dis-
tance of our office, who have not tasted of
the beverage called "Champagne Mead."
Certainly there can be no one who has not
heard of the pleasant beverage. But it
may not be known to all that it is strictly
Californian in all respects. If they doubt
this, we advise them to test it for them-
selves.

IMPROVED POTATOE DIGGER.—U. R. Har-
low, Farmersville, Tulare County. This is
an improved device which bids fair from
its simplicity and efficiency to prove of
great benefit to the farmer. It is a ma-
chine which resembles, in its general fea-
tures, a common single plow, having the
beam and handle constructed in the same
manner. Two mold-boards are employed,
standing at an angle to each other and up-
on each side of the beam, which plow
along under the hills of potatoes and raise
them with the dirt. Long fingers are ar-
ranged at the upper side of the mold-boards
through which the dirt passes and falls in
the rear, while the fingers are near enough
together to prevent the potatoes from pass-
ing through them, and those succulent ar-
ticles of diet consequently roll off to one
side, out of the way, upon the unplowed
ground. We saw, the other day, another
potatoe digger, apparently inferior to this,
which a French publication had seen
worthy to illustrate. The inference is ob-
vious.

SMASH-UP.—On Tuesday, a train on the
California and Oregon Railroad met with
an accident while on the trestle-work be-
yond the Feather River bridge. One of
the cars got off the track and fifteen freight
cars were thrown over and down a distance
of about 20 feet. Luckily no one was
hurt, except two persons slightly injured.
But the company loses, it is said, some
\$25,000.

Cattleya Mossiæ—A Beautiful Orchid.

We give herewith a representation of the
Cattleya Mossiæ, about one-third of its nat-
ural size. This plant belongs to an orchid-
aceous group of plants, of a somewhat eu-
rious organization, and with habits so un-
like most plants, that, except in few instan-
ces it has until recently been found quite
difficult to keep them alive any considera-
ble time after removing from their origi-
nal places of growth. This difficulty has
recently, however, been so effectually over-
come, that the orchid is fast becoming com-
mon. The flowers of these plants are usu-
ally very beautiful, of quite singular form,
and susceptible of great improvement from
careful cultivation. Species which in their
native homes appear with only two or
three of their curious blossoms in a cluster,
are found, under careful cultivation, to
yield from ten to twenty, and even thirty
blossoms.

No more difficulty is now found in domes-

Cattleya Mossiæ—A Beautiful Orchid.

ticating this plant, than is encountered in
cultivating the hyacinth, tulip or dahlia.
It was formerly thought indispensable to
attach them to a piece of cork or bark, or
to the trunk of a tree; but that treatment
has been pretty much entirely abandoned,
and they are now cultivated in dried peat
or even common garden mold, when well
mixed with decayed woody or fibrous
matter.

The plant here shown is one of the
most magnificent of the entire family; the
color and marking of the flower being
very striking. The petals are of a beauti-
ful rosy lilac. The inside of the tubular
part of the labellum or front segment of
the flower is yellow, the other portion lilac,
beautifully streaked and blotched with
crimson, and the whole is peculiarly frag-
rant. This plant is a native of Venezuela,
and was first sent to a Mrs. Moss, of Eng-
land, after whom the species was named.
We find it figured in the *Rural New
Yorker*, from which journal we have copied
the engraving.

REFINING AND DESILVERIZING LEAD.—
A late French invention is the refining and
desilverizing of lead by means of steam.
According to the patent, as we learn from
the London *Mining Journal*, the lead is
melted in a vessel and then run into a lower
vessel or vat, where steam is introduced
through a central pipe, leading down to
near the bottom of the vessel. The steam,
passing up through the molten lead, effect-
ually oxidizes all impurities, which rise as
scum to the top of the metal, whence they
are removed. The introduction of the
steam at the same time produces a violent
ebullition of the lead, and causes it to
crystallize. When the crystallization has
proceeded to a sufficient extent, the steam
is shut off and the remaining liquid por-
tion of the lead, in which the greater por-
tion of the silver is concentrated, is run off.
A fresh charge of melted lead, holding a
percentage of silver approximating that of
the crystals formed, is now introduced
from the upper or melting vessel, and the

New Books.

THE PRACTICAL AMERICAN MILLWRIGHT
AND MILLER: Comprising the Elementary Principles
of Mechanics, Mechanism and Motive Power, Hydraul-
ics and Hydraulic Motors, Mill Dams, Saw-Mills, Grist-
Mills, the Oat Meal Mill, the Barley Mill, Wool Card-
ing and Cloth Fulling and Dressing, Windmills,
Steam Power, etc. By David Craig, Millwright. Il-
lustrated by Numerous Wood Engravings and Fold-
ing Plates. Philadelphia: Henry Carey Baird, Indus-
trial Publisher, 406 Walnut Street. 1870. 8 vo. 432
pp. Price \$5. By mail, free of postage.

A perusal of a number of chapters of
this book has convinced us, that it is one
of the most successful volumes, intended
for the instruction of hard-working, prac-
tical men which we have ever received.
It bears evidence throughout of hav-
ing been written by one who has him-
self worked out, by personal experience,
the problems continually presenting them-
selves. As he has labored intelligently,
his results are valuable, especially as he is
enabled to get at and explain those points
so often passed over by the theorist, but
so troublesome to the every day mechanic.
He avoids the use of terms which cannot
readily be understood, using only plain,
every-day language. Naturally his style
is often faulty, from a literary point of
view, and he uses such expressions as
"allowing water to get dry," where he
means the object moistened, etc. But such
faults do not injure the object of the book
which "lays no claim to literary merit
further than to convey the knowledge and
experience, gathered in the career of a
hard-working, practical millwright and
miller, in plain, concise terms, without
any algebraic or scientific mystery." We
are ready to commend the volume. It will
help to clear up many cloudy matters
for the millwright, and show him many points
of which he may be ignorant. It gives a
short, concise, plain introduction on me-
chanical power, with practical illustra-
tions, and then takes up the various parts
of mills and milling machinery in detail.
We use it ourselves with profit.

THE YALE UNIVERSITY SCHEME. New
Haven. 1870.

This is a small pamphlet, by Prof. J. D.
Dana, called out by the unexpected pub-
lication of a familiar letter which appeared
to require an explanation, not necessary
when addressed to Yale graduates alone.
It treats of the classical and the scientific
departments at New Haven, showing their
relations to one another and to the Uni-
versity.

HEATH'S INFALLIBLE GOVERNMENT COUN-
TERTERT DETECTOR. Boston, Mass., and Washington,
D. C. Published by Leban Heath.

This is gotten up in very fine style, per-
mission having been obtained from the
Secretary of the Treasury for the use of
certain plates for the illustrations.

BARBAROUS DESTRUCTION OF FISH.—The
Fresno *Expositor* states that parties in
Merced county have stretched wire nets
across the San Joaquin river, in which
they catch salmon as they run up stream,
and feed the fish to their hogs. As a con-
sequence, the running of fish in Fresno
county is entirely suspended, whereas,
they should be passing up in large num-
bers.

PAUL'S ELECTRIC PROCESS.—By a refer-
ence to our advertising columns it will be
seen that this process is able to speak for
itself in its practical working. Actual re-
sults are here recorded. Mr. Paul seems
to be cutting down the costs of building
quartz mills, as well as doing better work.
This is what the country wants.

THE CROPS IN IRELAND.—Are said to pre-
sent a most favorable appearance—includ-
ing grain, grass, and roots. Late rains have
done a great amount of good.

THE copper works at Vershire, Vermont,
are employing from 250 to 300 workmen,
yield about 125 tons of ore per week, and
claim to be the only copper mines in the
country which pay expenses.

Oil Cake Meal.

THE BEST FEED KNOWN
FOR LIVE STOCK.

We desire to call attention to Oil Cake Meal, which we
are now manufacturing. No description of feed so
greatly promotes the health of animals as Oil Cake Meal,
and we urgently request all engaged in the dairy busi-
ness, raising and fattening stock, or wool growing, to
give it a trial, feeling confident that they will find it of
very great value. By those who have used it thor-
oughly, one pound is pronounced to be equal to two
pounds of Corn Meal, and in the United States Govern-
ment Report of the Department of Agriculture for 1865,
it stands in the following relation to other feeds as to
the percentage of flesh produced from a hundred pounds
of feed, viz: Indian Corn Meal, 11 per cent.; Barley
Meal, 13 per cent.; Oat Meal, 18 per cent.; Oil Cake Meal,
22 to 100 per cent. For life-sustaining properties to all
stock exposed to sudden changes of weather or over-
driving, it has no equal.

For MILCH COWS it is particularly valuable, increas-
ing the quantity of milk and improving its quality to a
far greater extent than any feed known. A suitable
quantity for them at the commencement is one quart in
the morning and one quart at night, either alone or
mixed with any other feed; generally raised with the
mash of bran, slops, roots, or cut feed of any kind. It
improves it to soak it for six or eight hours, the effect
being to increase its bulk two or three times. The
quantity can be increased gradually, according to the
effect produced—ordinarily not exceeding three or four
quarts per day.

FOR BEEF CATTLE it has fattening properties which
cannot be found in any other feed—the beef always be-
ing more tender and juicy, and of a much finer quality
than when fattened on any other feed, and no feed
known will so quickly prepare animals for market as
Oil Cake Meal.

FOR HORSES a small quantity given daily promotes
their health, and is especially valuable for them when
chilled or injured from over-driving. It is one of the
best remedies known for Horses subject to the Heaves
or Rheumatism, and greatly increases the cleanliness
and glossiness of the hair.

FOR SHEEP there is no article of food known that
produces such the mutton or so promotes the growth of
wool. A small quantity given to chilled Cattle or Sheep
will keep them alive and greatly increase their warmth
and vitality.

At present price (\$25 per ton) it is the cheapest feed
in market. It is now selling in New York at \$42 per
ton gold; at \$50 per ton in England, where it has been
proven for a long time to be in every respect the most
profitable feed known for stock of all kinds—one ton be-
ing fully equal to three tons of bran.

The increasing demand for this meal from those on
this coast by whom it has been thoroughly tested, has
induced us to increase our facilities for its manufacture,
and we are now fully prepared to furnish it in quan-
tities as may be desired. For sale by the Grain and Feed
Dealers, and at the manufactory, King street, near Third.
All orders will receive prompt attention. Address—

THE MILLS INSTITUTE.

The Mills Institute is situated a mile from the San Leandro road, and about five miles from Oakland, and is accessible to parties from San Francisco by a fine avenue leading from the Park station, (on the line of the S. F. & Alameda R.R.), and terminating at the grounds of the Institute. The property, lying close to the foothills, consists of almost fifty acres of land, including portions of the surrounding hillsides. On a level space of of ten to fifteen acres, stands the building. A beautiful stream of water (never failing) flows close to the north wing, a fine orchard lies in front of the building, and the intermediate space is laid out in the most approved style with a fountain, ornamental trees, shrubbery and walks, and, judging from a photographic view of the Institute and grounds as projected, the place will be a perfect Eden in appearance.

The frame is up and partially enclosed and ready to roof, and will be ready for the reception of pupils after the July vacation next year. Messrs. Bngbee & Son are architects. J. W. Willur is the builder, and and T. H. Lufkin the overseer. The building is both extensive and commodious and is unique in appearance, (something unusual in large buildings). The center or main portion has a frontage of 43 feet, with two wings on each side, measuring 36 and 47 feet each. The north and south wings are 134 feet in depth, having large octagonal bay windows immediately behind the main portion of the Institute there is quite a large building to be used for a dining room, which connects by a corridor with the veranda in such a way that it might be considered a part of the main establishment. There is to be yet another building erected in rear of the dining room for kitchen purposes. The Institute is three stories high, the lower story being 16 feet and the others 15 and 12 respectively. It is surmounted by a French roof, the second story floor being supported by a truss, and the lower story being unobstructed by supports, making one of the most spacious halls in the country, and measuring 47 by 134 in the clear.

A magnificent hall, 12 feet wide runs through the entire length of the building. It is so constructed with regard to light, that there will be no dark rooms in the whole Institute. It will be fitted with gas and water pipes. An extensive reservoir will be constructed on one of the adjacent hills to contain the supply of water conducted from a never-failing mountain spring in the immediate vicinity.—[Oakland News.]

Ten savings banks of San Francisco hold deposits amounting to \$29,842,112 in gold. The number of depositors is 45,601. The deposits held by our savings banks six months ago were \$26,634,523, giving for increase in deposits \$3,207,589.

About twelve years ago says Carter's Circular, San Francisco, one of our surveyors had occasion to make a survey of land near the ocean. The tract surveyed was then nearly half a mile distant from any sand drifts. A short time ago he was called upon to make another survey at the same place when to his astonishment he found that it was covered with sand-dunes, the drifts having advanced inward over a half mile since his first visit, twelve years before. At this rate, if they were not checked, it would not take very long for the aggressive sand-drifts to cover every foot of the entire peninsula on which the city is built.

Marysville has a population of 4,800.

A NEW BOOK FOR MINERS

[Issued July 1870.]

ROASTING OF GOLD AND SILVER ORES AND THE EXTRACTION OF THEIR RESPECTIVE METALS WITHOUT QUICKSILVER.

BY G. KUSTEL,

MINING ENGINEER AND METALLURGIST,
Author of "Nevada and California Processes of Silver and Gold Extraction and Concentration of all kinds of Ores."

CONTENTS:

I. INTRODUCTION.

Classification of Ores; Important Silver Ores; Difference between Real Silver Ores and Argentiferous Ores; Important Combinations; Means of Desulphurization; Means of Reduction; Desulphurization of Ores Not Efficient; What a Chloride is, and How Chlorination is Effected; Means of Separating the Metals from Chlorides.

II. ROASTING OF ORES.

A. Chloridizing Roasting; Necessary Amounts of Sulphuric; Amount of Salt Used; Permanent Stirring Not Essential; Signs of a Good Chloridizing Roasting; Means of Destroying Base Metal Chlorides; Steam decomposes Base Metal Chlorides; Application of Steam in Roasting; Lead has a Bad Influence; Difference in Roasting Processes; In what condition the Metals are after Roasting; Changes in Roasting; B. Oxidizing Roasting; Chemical Changes in Roasting; What Process requires Oxidizing Roasting; Roasting Furnaces; Furnaces managed by Handwork; Reverberatory Furnaces; Single Roasting Furnace; Double Roasting Furnace; Long Roasting Furnace; Muffle Furnace; Furnaces with Mechanical Apparatus; Revolving Hearth Furnace; Ernst's Rotary Furnace; Parke's Furnace; Buckner's Furnace; O'Hara's Chain Furnace; Stetefeldt's Furnace; Chinnery's and Fines.

III. EXTRACTION OF SILVER BY LIXIVIATION.

C. Solving Process; Extraction of Silver; Precipitation of the Silver; Treatment of the Precipitated Silver; Precipitation of Copper; Quality of Ores fit for the Solving Process; Sulphide of Calcium; Hyposulphite of Lime; Patra Process; Kiss Process; Patra and Rosner Process; Kustel and Hofmann Process; Augustin Process; Zilvergold Process; The Leaching Process.

IV. EXTRACTION OF GOLD.

D. The Chlorination Process (Plattner's); Chlorination of Sulphurets and Arseniurets.

This new book on the treatment of gold and silver ores without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of the various processes and apparatus employed in this country and in Europe, and explains the why and wherefore.

Every vein miner and millman will find much in it which will show him how to avoid many difficulties, and how to make many improvements, and throughout the book passages are continually occurring which will meet each one's individual troubles to a very considerable extent.

The book is not only a valuable condensation and simplification of much that has already been published, either in German or English, but it goes beyond all others in giving now and practical improvements in the treatment of ores. In the various descriptions and explanations, hints and remarks are being continually made which give it a peculiar value for the coast, and that which is new is founded on good theoretical knowledge, and proved by a large practical experience with our various ores.

It is divided into four parts: I. The Introduction, treating briefly of ores, and of Desulphurization, Reduction and Chlorination in general; II. Roasting of Ores, entering into a detailed description of the various furnaces and processes, and giving explanations of the latter; III. Extraction of Silver by Lixivation, showing how this is done, and when it is advisable, especial reference being also had to amalgamation; and IV. Extraction of Gold by Chlorination.

It contains 142 pages embracing illustrations of furnaces, implements and working apparatus. It is a composition of much care and labor by the author, who has condensed and simplified the form in which the information is given, rendering the book of three more value to the practical man than a more voluminous work would be. It is a work of great merit and value by an author whose reputation is unsurpassed in his speciality. Its price, considering its special character and value, is very reasonable and small in comparison to the information so well rendered in its crowded pages. Price \$2.50 coin or \$3 currency, postage free.

Printed and Sold by

DEWEY & CO.,

Publishers and Patent Agents, Scientific Press Office, San Francisco.

NEW WORK BY KUSTEL.—"Roasting of Gold and Silver Ores, and the extraction of their respective metals without quicksilver." Under this title Dewey & Co., of the Scientific Press, San Francisco, will soon publish an excellent work by Guido Kustel. The reputation of the author renders unnecessary any further recommendation of the work, which, it is said, will be a clear and complete treatise on these subjects, which are of so much interest at the present time. Miners and others will find it of great value. The various methods and furnaces employed in roasting, and chlorination and lixiviation with the different manipulations and apparatus, will be fully described, and amply illustrated, together with remarks on the various advantages and disadvantages of each process, and their special application on this coast.

The above work contains 120 pages, and the price is \$2.50 coin or \$3 currency. For sale at his office.

Valuable Books on Mining, Mineralogy, Geology, Metallurgy, Etc.

ANTISELL.—The Manufacture of Photogenic or Hydro-Carbon Oils, from Coal and other Bituminous Substances, capable of supplying Burning Lamps. By Thomas Antisell, M. D. 1 vol. 8vo. 2 50

AARON (CHAS. H.).—Treatment of Rebellious Silver Ores. 8 pp.; pamphlet. S. F., 1869. Postage free. 25

BROWN (H. T.).—507 Mechanical Movements. Dewey & Co's Scientific Press Edition, S. F., 1869. The most complete publication of illustrated mechanical powers with replete descriptions. 131 pp. Cloth bound; postage free. 1 00

BARSTOW.—Sulphurets; What they are, How Concentrated, How Assayed, and How Worked; With a Chapter on the Blow-pipe Assay of Minerals: 1 vol. 12mo. cloth. 1 00

BLAKE, W. P.—Annotated Catalogue of California Minerals. 8vo. 50

YALE'S Mining Claims and Water Rights. 8vo. 7 50

Any of the above Books will be furnished by return mail or express, on receipt of price, in coin, postage added. Any other books desired will also be furnished at the lowest San Francisco retail prices. Address, DEWEY & CO., Scientific Press Office, San Francisco.

The Scientific Press, published at San Francisco, has entered upon its 21st volume. It is a journal devoted to art, science, mining and agriculture. It should be the constant companion of every farmer, miner and mechanic on the Pacific coast. We consider it one of our most valuable exchanges and are pleased to note its signs of prosperity. *Tuolumne City News, July 8th.*

W. H. MURRAY, traveling agent for the San Francisco Scientific Press, arrived in town on Sunday from a protracted visit to the mining districts in the northern country and Idaho. He reports mining matters generally in a flourishing condition, and he is particularly impressed with Copo district. He goes to Mineral Hill and Eureka from here.—*Elko Independent, July 6th.*

NEW EDITION

—OF—

507 Mechanical Movement.

PUBLISHED BY

DEWEY & CO.

LIST OF CONTENTS.

Alulipile.
Balance, Compensation; Barometer; Blower, Fan; Brako, Friction.
Cams; Capstans; Controlinead; Clutches; Chasers; Clamps, bench and screw; Cock, four-way; Column, oscillating; Compasses, proportion; Counters of revolutions; Coupling, union; Crank—substitute for the variable; Cranks, bell and compound; Cyclograph, Differential Movements; Drag-link; Drill—Fiddle and Persian; Drills, Cramp; Drop; Drum and Rope; Driver, Pile; Dynamometers.
Eccentrics; Ejectors, Dilge; Ellipsograph. Engine, Disk; Engines—Rotary, Steam, Valve Gear for; Epicyclic Trains; Escapements.
Fountain, Hero's; Fusces.
Gasometers; Gauge, Bisecting; Gauges, Pressure; Gear, Steering; Gearing—Bevel, Drush, Capstan, Conical, Crown, Eccentric, Elliptical, Face, Friction, Internal, Irregular, Multiple, Mutilated, Scroll, Sector, Spur, Step, Stud, Sun and Planet; Gearing—Variable, Worm; Governors; Guides; Gyroscope.
Hammers, Atmospheric; Bell, Compressed Air, Trip, Steam; Helicograph; Hook—Bolt-detaching, Releasing; Hooks, Centrifugal Check; Hyperbolas, Instrument for Drawing.
Intermittent overvents.
Jack—Hydrostatic, Lifting; Joint—Ball and Socket, Bayonet, Universal.
Ladder—Folding, Self-Adjusting; Lazy-tongs; Level, Self-recording; Lever—Bell-crank or Elbow, Knece; Lewis; Link Detachable Chain.
Machine—Bohenberger's, Drilling, Polishing, Punching, Warp-dressing; Main, Flexible Water; Maintaining Power; etc.—Gas (wet and dry), Water; ill—Barker's, Crushing, Tread, Wind; Miscellaneous ones not; oil—oil—muting Traverse, Rocking, Self-reversing, Shuttle; Motions—Feed, Link, Parallel, Pump, Traverse, Variable Traverse.
Pantograph; Parabolas, Instrument for Drawing; Paradox, Mechanical; Pendulum, Conical; Pendulums, Compensation; Pinion—Lantern, Mutilated, Slotted, Two-toothed; Pulley, Horse; Presses, Hydrostatic; Propeller, Screw; Pulley—Expanding, Friction; Pulleys—Anti-friction Bearing for, Chain; Pump—Air, Balance, Bellows, Chain, Diaphragm, Steam-siphon; Pumps—Double-acting, Force, Lift, Rotary; Punching Machine.
Rack—Mangle, Mutilated; Racks and Pinions; Ram, Mottgoller's Water; Ratchets and Pawls; Regulator—Gas, W. ch. Reversing Motion, Self; Revolver; Rollers, Oblique; Rolls—Anti-friction, Drawing, Feed; Belts, Parallel.
Saw—Endless Band, Gig, Pendulum; Screw, Archimedes, Differential, Double Reversed, Micrometer; Screws—Endless, Right-and-left Hand; Sectors; Saws; Shears; Stumps; Stand, Mirror; Stop—for Hoisting Apparatus, for Lantern Wheels, for Ratchet Wheels, for Spur Gear; Stops for Winding Watches.
Test, Friction; Thrutle, Spinning; Toggle-joint; Tongs, Lifting; Tread, Steam; Truss, Steady.
Water Machines for Raising; Weir, Self-acting; Wheel Cam, Lantern, Persian, Pin, Rag, Sprocket, Steering, Waved; Wheels—Crown, Mangle, Paddle, Water; Windlass—Chinese, Friction; Windmills; Wipers.
This book is bound in cloth, and embraces 122 pages. The illustrations are plain, and each figure is clearly described on the page opposite to it. It is a low-priced book for its kind, and there are few persons who have to do with machinery, or are interested in understanding the science and principles of motion, who will not be benefitted and satisfied by its purchase.
A liberal discount made to the trade. Single copies, \$1—sent postage free. Address orders,

RATES BY THE LINE.

One inch.....	2.00	5.00	10.00	36.00
Two inches.....	3.75	7.00	18.00	70.00
Three inches.....	5.25	12.50	27.00	105.00
Four inches.....	6.75	16.00	36.00	140.00

Per line.—One week, 25 cents; one month, 80 cents; three months, \$2; one year, \$5.

Per line, ten lines or more.—One week, 20 cents; one month, 30 cents; three months, 80 cents; one year, \$3.20. MINING AND LEGAL ADVERTISEMENTS will be inserted at special rates—less than one-half the cost of daily publication.

Particular attention will be given to preparing engravings, inserting advertisements in conspicuous, novel and attractive form. We will otherwise assist advertisers in getting up their notices, when desired.

All advertisements in the Press appear in both the MONTHLY and QUARTERLY SERIES of the SCIENTIFIC PRESS, which (by special arrangement) are placed for FREE READING in the principal hotels, steamboat and steamship saloons, depots, and public reading rooms and libraries in San Francisco and the Pacific States. Many volumes are also bound, thus affording permanent advertising.

The Press now receives the largest and best advertising patronage of ANY WEEKLY PAPER west of the Rocky Mountains.
In regard to the value of advertising in our journal, we refer with pleasure to those who can speak from experience—our advertisers. Better references, or more reliable names, cannot be found in the advertising columns of any newspaper in the world.

PAIN KILLER

PROP.

PERRY DAVIS & SON

PROVIDENCE, R. I.

1840 1870

This Valuable Family Medicine has been widely and favorably known in our own and foreign countries upwards of THIRTY YEARS!

It has lost none of its good name by repeated trials, but continues to occupy a prominent position in every family medicine chest.

It is an External and Internal Remedy. For Summer Complaint, or any other form of bowel disease in child or adults, it is an almost certain cure, and has without doubt, been more successful in curing the various kinds of Cholera than any other remedy, or the most skillful physician. In India, Africa and China, where this dreadful disease is more or less prevalent, the Pain Killer is considered by the natives, as well as European residents in those climates, a sure remedy; and while it is a most efficient remedy for pain, it is a perfectly safe medicine, even in unskillful hands. Sold by all Druggists. Price 25 cents, 50 cents, and \$1 per bottle.

Directions accompany each bottle.

For Durability, Efficiency,

AND ECONOMY OF WORKING,

HAS NO EQUAL.

The Wilson Steam Stamp Mill is the only Steam Mill that has had the severe ordeal of practical working, and proved itself eminently successful. It is now in operation in several of the Eastern States and Territories, and gaining an enviable popularity. The whole machine is so simple as to be readily understood by the most ordinary minds. In fact, its simplicity is its durability. The expense of crushing rock or cement with this Mill is less than one-half the expense of any other Stamp Mill, and less than one-half the cost. For further particulars inquire of

FURMAN R. WILSON,

San Francisco.

Or of THE WILSON STEAM STAMP MILL CO., 326 Walnut street, Philadelphia, Pa.

Notice.—All persons are hereby warned not to manufacture or use any Steam Stamp Mills that are an infringement on the Wilson Patents, as they will be prosecuted to the utmost rigor of the law.

F. R. WILSON,

20v19-1f Supt. W. P. S. S. M. Co., Philadelphia.

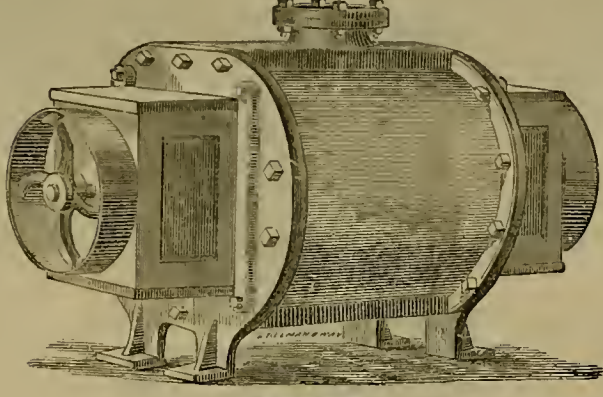

Thursday Evening.

Owing to the time necessary to mail the present large edition of the SCIENTIFIC PRESS, we are obliged to go to press on Thursday evening—which is the very latest hour we can receive advertisements.

ROOT'S PATENT FORCE BLAST ROTARY BLOWER.

MANUFACTURED BY KEEP & BARGION.

At the Globe Iron Works, Stockton, California.

Patented Nov. 1st, 1864 July 24 1866 and Oct. 9, 1866.

Awarded the First Premium at the Paris Exposition.

ADAPTED FOR

Smelting,

Foundry,

Mining

and

Steamships.

REQUIRES

Fifty Per Cent.

LESS POWER

Than any Blower

Now in use.

One of these Blowers may be seen on exhibition at W. T. Garratt's Brass Foundry, corner of Mission and Fremont streets. They are also in use at the Almaden Quicksilver Mine; Gridley's Foundry, Gold Hill, Nevada; Aena Iron Works, San Francisco, and many other places.

CAUTION.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirements of the genuine article.

Quartz, Saw and Grist Mill Irons, Steam Engines, Horse Powers, High and Low Pressure Steam Engines, Steamboats and Propellers, made at short notice.

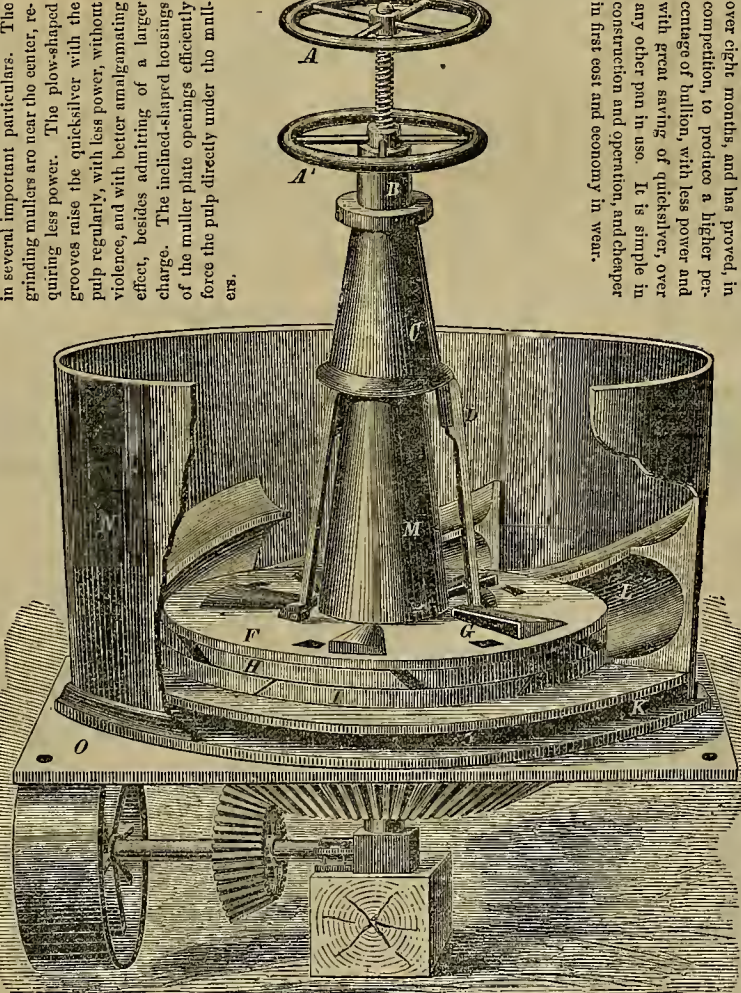

For circulars and further information, address

KEEP & BARGION,

Globe Iron Works, Stockton, Cal.

4v163m

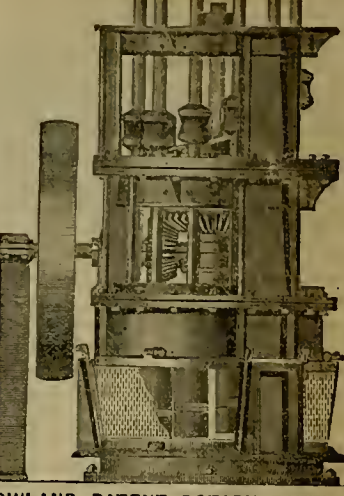

STEVENSON'S PATENT MOULD BOARD AMALGAMATING PAN.

This Pan is far superior to all others in several important particulars. The grinding millers are near the center, requiring less power. The plow-shaped grooves raise the quicksilver with the pulp regularly, with less power, without violence, and with better amalgamating effect, besides admitting of a larger charge. The inclined-shaped housings of the miller plate openings efficiently force the pulp directly under the millers.

It has been constantly running for over eight months, and has proved, in competition, to produce a higher percentage of bullion, with less power and with great saving of quicksilver, over any other pan in use. It is simple in construction and operation, and cheaper in first cost and economy in wear.

Manufactured at the Golden State Iron Works (Co-operative), 19 First street, S. F., Where it can be examined and further particulars be learned; or persons may apply to the inventor and patentee, Mr. C. O. STEVENSON, at the Douglas Mine, GOLD HILL, STATE OF NEVADA, where the Pans have long been in constant operation.

HOWLAND PATENT ROTARY BATTERY

of 12 stamps. It requires no frame to put it up. Guaranteed to crush 1 1/2 to 3 tons per day to the stamp. The best Battery ever used for amalgamating gold, or crushing silver ores, dry or wet. Can be put up on a mine in running order for one-half the price of this straight battery, and in three days after its arrival at the mine. 12-stamp battery, 20,000 pounds, with frame complete, price \$3,000; 6-stamp battery, 8,000 pounds, price \$1,300. All prices named to be paid in currency. Every mill run at shop before shipping.

California Stamp Mills.

All the various styles of Pans, Amalgamators, Separators, Settlers, Concentrators, Dry or Wet for working Gold, Silver or Copper Ores, the same as built in California and at lower prices. SHOES AND DIES made of the best white iron. Send sizes and we will make patterns and forward Shoes and Dies at low prices. Engines, Boilers and fixtures, and other Machinery made to order. Also, Howland's Patent Rotary Valve Double or Single Engines.

Irons for the best California 10-stamp mill, straight battery, complete, \$1,600. Irons for low mortar, old style mill, much less. Send for a Circular.

MOREY & SPERRY,

Address 95 Liberty street, New York.

N. B.—Mr. W. H. HOWLAND, formerly of the Miners' Foundry, is now in San Francisco for a short time, and will receive orders for mining and other Machinery of Eastern manufacture at the lowest rates and most favorable terms. Orders may be left at S. W. HOWLAND & CO'S, 413 and 415 Mission street, between First and Fremont, San Francisco. 4v21-3m

VARNEY'S

PATENT AMALGAMATOR

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the best material now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottom, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the miller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Settlers made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and settlers for themselves, at the office, 229 Fremont street, San Francisco. 1v1

SILVER-PLATED

AMALGAMATING PLATES

FOR SAVING FINE GOLD.

SAN FRANCISCO

Gold and Silver Plating Works.

QUARTZ MILL MEN,

Miners, Hotel-keepers and Others,

ATTENTION!

The SAN FRANCISCO PLATING WORKS are prepared to furnish and silver-plate Copper Amalgamating Plates of all sizes, and in any quantities, at the very lowest rates. FULL WEIGHT OF SILVER deposited, and satisfaction guaranteed in every respect. Particular attention given to plating goods for BUILDERS, PLUMBERS and GUNSMITHS. Old Goods of all kinds re-plated for hotels, restaurants, etc.

The finest quality of Sheet Copper expressly for mining purposes furnished and cut to any size at the lowest rates. Full assortment of Plated Goods and Cutlery for sale at low rates.

E. G. DENNISTON, Proprietor.

HAVILAND, HOOPER & CO., Agents, Crockery and Glassware Dealers, 345 Pine street, near Montgomery San Francisco. 1v20-3m

ALL work done at the lowest prices.

SEVERANCE HOLT & CO.,

MANUFACTURERS OF

Diamond-Pointed Drills

AND DRILLING MACHINERY,

For Mining, Quarrying, Shafting, Tunneling, Prospecting, Draining, Grading and Submarine Blasting. Special attention given to Deep Boring for testing the value of Mines. Also to Boring Artesian Wells. Office, 318 CALIFORNIA STREET, San Francisco. 25v20-3m

QUARTZ MILL AMALGAMATING

PLATES, plated with fine silver in an improved manner, at the very lowest rates. The best American copper furnished and cut to order. Old plates bought or worked. Old plated goods, of all kinds, repaired and replated. Work guaranteed and at Eastern prices.—Articles can be sent and returned by Express, by

Harris' Adjustable Pipe Nozzle.

Hydraulic "is," a California word for a California process. Although the enormous power of water has long been known, yet it was reserved for our pioneers to apply it in this way for the purpose of extracting the most precious of metals from the grave where it lay buried. That Californians claim the process as their own peculiar property and a matter of pride to

the Coast, was well illustrated several weeks ago, when a fine panorama of sights and scenes of our State was exhibited. As the grand views of some of our most noted natural beauties were unrolled to their gaze, the audience were appreciatively enthusiastic, but when the canvass displayed an illustration of one of our huge flumes and of the powerful streams of water washing down the hillside, the applause was deafening.

Having once commenced to employ this process, the attention of our miners has since been continually applied to perfecting it in its details. One of the inventions in this direction is here illustrated. The larger figure represents the discharge-end of an hydraulic nozzle. On this is pivoted a curved lever, to which is fastened by a pin, as shown in the cut, a ring which has a seat formed on the inside circumference, in which set other smaller rings of different sizes, two of which are shown separately in the drawing. In the nozzle is a slot for the entrance of these rings. The object is to diminish or increase the size of the stream thrown, without being obliged to shut off the head of water,—a thing often very desirable in hydraulic mining. With this apparatus, it is only necessary to fit the ring for giving the desired sized stream in the ring held by the lever, and then to introduce this ring into the nozzle by turning the lever. The cut, for the sake of clearness, shows the holding ring introduced part way into the nozzle.

This nozzle has been tried in Plumas, Sierra and Butte counties, and is pronounced "an entire success" by parties who have used it, as may be seen by a reference to our advertising columns. The object for which it is intended is certainly an important one. For further information apply to Messrs. Harris and Klemmer, La Porte, Plumas county.

WHEAT SHIPMENTS FROM VALLEJO.—The 13th ship, for the season, has just completed her loading with wheat at Vallejo.

Wire Tramway.

We gave a description, on the 20th of August, of the Hodgson wire tramway. We add to-day a couple of rough diagrams, which will give our readers a clearer idea, perhaps, of the contrivance. Fig. 1, shows the apparatus for supporting the ropes. This is an iron standard, H, which supports a platform, G, on which are two pulleys, F, one at each end. The pulleys support the wire-rope, which is endless, so that the loads go down on one side of the standards and return on the other.

Fig. 2 shows the way the load is carried. The box-head, A, rests generally on the wire-rope, I, as shown, and is carried along with the rope. The box, E, is suspended to the box-head by means of a curved arm, D, which maintains the box in equilibrium and enables it to pass the supporting posts and pulleys. The box-head has four wheels, B, which run on rails, C, placed on the platform, G, Fig. 1, when a post is reached, and thus enable the box-head to pass the pulleys.

FIG. 1.

HODGSON'S WIRE TRAMWAY.

PALMER'S INFALLIBLE TRACE LOCK.

The above shows the general idea of this part of the tramway. We hope to be able to get soon the details of the one to be erected at White Pine, which have been promised us. This line will be working before a great length of time has elapsed, as we are assured, and will be undoubtedly the forerunner of other similar improvements in our mining districts.

During the month of August the Manhattan twenty-stamp mill, at Austin, Nevada, produced \$123,000 worth of bullion. As this mill does not work Sundays, this is \$5,500 per day.

An Infallible Trace Lock.

The necessity for a device for securely fastening a trace in position on a whiffle-tree more reliable than the ordinary strip of leather, has long been felt, and its absence has been the cause of many deplorable accidents destructive to both life and property.

It is a part of the experience of every person driving horses, that the traces frequently become unfastened even in cases where extraordinary precaution is taken, and in such instances it only requires that the animal driven should be restive, spir-

FIG. 2.

there is no motion of the animal, harness or vehicle that can cast it loose without breakage, while, as can be seen, it will readily yield to the movement of the finger and thumb when required.

This simple device seems to fulfill all the purposes intended, furnishing absolute security against accidental detaching of a trace, and being light, cheap, ornamental, and easily applied. We learn that arrangements are being perfected in Cincinnati for its manufacture on a large scale. Parties wishing full information or right to manufacture in Pacific States, should address O. Palmer, Esq., Cincinnati, Ohio, or R. C. Myers, Covington, Ky.

CHLOROFORM.—A single manufactory of chloroform in Edinburgh is stated to make daily as many as 8,000 doses, or some two and a half millions yearly.

THE WEST INDIA CABLE.—The shore end of this cable was successfully landed at Santiago on the 31st of August.

ARIZONA ITEMS.—Mr. G. T. S. Curtis, of whom we spoke in our issue of August 6th, has shown us letters containing additional confirmation of the successful working of the mines of Lynx Creek. Messrs. C. C. Bean and J. Atcherson (of this city) have bought the Eureka mill put it in first-rate order and are running it at a net profit of \$20 per ton, or some \$250 per day. The Big Bug mill, which is again running, is turning out weekly from \$2,200 to \$3,000. The placer mines about Lynx Creek and Big Bug district are paying from \$5 to \$12 daily to the man. "The Bradshaw mines," says a writer, "are paying rich. McCracken, Taylor & Co. came in the other day with 112 ounces of gold, taken from six and a half tons of ore worked in an arastra." The general mining news are very good. The Indians are very quiet in Stoneman's district, and

"will be kept so." Mr. Kelly, also lately from Arizona, says that the Heintzelman mine is to be run by Chicago parties, and that the Moss ledge is to be taken up by an English company. The Indians have been making some trouble and are reported as active around the Burro mines, we hear. By the way, we have heard a theory advanced by an Arizonian lately, that the first step to be taken with regard to stopping Indian troubles, ought to be to remove the soldiers! With no quartermaster's department, the Indians would have much greater trouble in getting supplies, ammunition, blankets, etc.

We have been shown some very beautiful specimens of gold from the Mayflower ledge. This is situated some two and a half miles from the Prescott stage road, in Martinez district, Yavapi county, and was discovered by Mr. Dennis May, last February. The ledge crops out some two miles, and shows rich in gold. An assay certificate shown us gives a total value of \$609.07 per ton; of this, \$602.79 in gold. A company is about to work the ledge, having leased a 10-stamp mill in Wickenburg for the purpose, and expect to treat some 600 tons monthly. A shaft is now down about 20 feet.

ited or vicious, to insure a first-class runnaway, to point a paragraph in the daily press, usually under the head of "serious accident."

The subject of the accompanying illustration is the "Infallible Trace Lock," patented by Oliver Palmer, of Cincinnati, April 5th, 1870, a glance at which will explain its operation: It is intended to supersede the yielding strip of leather so long in use, so liable to be broken or misplaced, and furnish a substitute that will be cheap, ornamental and durable, while assuring safety in cases where ordinary vigilance would fail.

When unlocked, it springs back entirely out of way (as shown in the lower figure), and is ready for instant use. When locked

Communications.

IN THIS DEPARTMENT we invite the FREE DISCUSSION of all proper subjects—correspondents alone being responsible for the ideas they advance.

Battle Mountain District.

[Concluded from page 154.]

Coming back to Battle Mountain, we see the Little Giant, a silver mine of good repute, well and favorably known throughout the State. It has a five-stamp mill, but, from some defect in its working process, does not do justice to the mine, its tailings sometimes assaying from one hundred to one hundred and twenty-five dollars per ton. Its worthy proprietor, Mr. Fox, however, intends erecting new works, by which the ore can be reduced through the roasting process, when, without doubt, the Little Giant will stand high upon the records among the valuable mining properties of this State.

To the westward of Little Giant, in a locality known as Cottonwood Cañon, is a wonderful ledge, called the Columbia. It is of almost pure antimony and of immense size, being eight feet in width. It is most admirably located, up the side of the mountain, about three hundred feet from the bottom of the Cañon, in which a fine stream of water runs the year round,—a great consideration in this district. A tunnel can be run to it with great facility, or its ores can be precipitated from the top through a chute into wagons below. It is a new mine, and its principal owner, a gentleman of capital, from New York, fully convinced of its great value, is working it vigorously. A shaft has been sunk about twenty-five feet, and there is no reason, so far, to believe that his most sanguine expectations will not be realized.

Back to Battle Mountain again and beyond, to the eastward, are several fine copper ledges, the most prominent of which is the Washington. This is indeed a promising mine, far more so than that of the Battle Mountain Mining Company, at the same depth and stage of development. It is owned by A. Duane McDonald, Esq., an indefatigable and persevering worker, who can congratulate himself upon having become the owner of a most valuable piece of property at a small outlay. The ledge holds copper, is 1,200 feet in length, crops out nearly the entire distance and carries gold and silver in considerable quantities. Its course is north and south, dipping to the eastward about twenty-five degrees. The croppings are strong, varying from three to ten feet in width, and a number of cuts and excavations on the ledge show it to be a well defined and true vein. An incline sunk to the depth of fifty feet near the center of the ledge, which is about six feet in width, shows a regular and well defined vein of from three to four feet in thickness, carrying a large percentage of carbonate and sulphuret ore, with a good showing of red oxide of copper at the bottom of the shaft. This claim is situated three and a half miles from, and at elevation of about 800 feet above, the nearest shipping point on the C. P. R. R. A spring of good water is about a mile distant, and could be brought to the mine at a trifling expense. Other good ledges are in this neighborhood. Some of them have yielded from 20 to 40 per cent ores, quantities of which have been shipped to and sold in San Francisco.

Should parties ever conclude to erect works for smelting these ores, the facilities for obtaining water and fuel at reasonable prices, in close proximity to a shipping point, render it, in my opinion, a peculiarly advantageous point for investment of capital.

Many other localities in this district are well worthy of notice, and, should you consider this communication entitled to a place in your columns, you may hear from me again some future time. D. W.

Battle Mountain, Nev., Aug. 19, 1870.

From Utah Territory.

[Written for the Scientific Press.]
Ogden.

This city, the junction of the Union and Central Pacific and Utah Central railroads, is a place of no little importance. Located in 1850, at a point 36 miles from Salt Lake City, 740 from Sacramento and 1032 from Omaha, it has now a population estimated at 6,000 (including that just about the place), two good hotels—the Ogden House and the White House, a large Tabernacle, a school house, flour mills, and a well-edited semi-weekly newspaper—the *Ogden Junction*. There are some large stores here and a number of business houses. The Zion's Coöperative Mercantile Institution, a branch of the main house at Salt Lake City, is quite a successful affair, which declared a dividend of 12 per cent. the first six months, and one of 8 per cent. the next half year. The smaller stores buy their goods of the large, wholesale establishments, and retail them to their customers, and they too are carried on on the coöperative plan. The prices are set very low. The farmers carry their produce to the stores and exchange this for what they may need, as there is a scarcity of money in the place.

The Ogden Mills, owned by Mr. L. Farr, are located a short distance from the city. They have here four pairs of stones, with which they can grind some 80 bushels daily. The motive power is furnished by water, there being a centre-vent wheel, six feet in diameter.

The Weber Mill, situated some distance below the other, is a three-story stone building, contains 4 run of French burr-stones and is run by two turbine wheels. When they are at work, and they are very busy at present, they average some 8 bushels per hour.

Not far from this place are the Woolen Mills, which are not running now, but will be in operation in a short time.

Around Ogden are a number of pleasant villages:—North Ogden, Willard, Plain City, Slaterville, Lynne, and a few others, all farming communities lying within a radius of from two to ten miles.

On the Utah Central Railroad.

Shortly after the completion of the Pacific Railroad, operations were commenced on the Utah Central. This was begun in May, 1869, and finished Jan. 10th, 1870. The first sod was turned and the last spike was driven by the President of the road. This spike, by the way, was made of iron manufactured in this territory. The officers are: President, Brigham Young; Vice-President, Hon. Wm. Jennings; General Superintendent, Joseph A. Young; Gen. Freight and Passenger Agent, David O. Calder.

Leaving Ogden, at 5 P. M., on this road, we have a very fine ride through beautiful scenery. The land between Kaysville (16 miles distant) and Ogden is now unproductive, but as experience has shown that such land needs only water to make it valuable, a company has organized and is now constructing a large canal to irrigate the whole area. After Kaysville we come to Farmington, then Centreville and then Wood's Cross, and finally reach Salt Lake City at half past seven.

Considering all the circumstances, this Utah Central is a wonderful road. Built out here by a moneyless people, it is well constructed, well managed and a monument to the industry and perseverance of the builders. I found the trip most comfortable and pleasant, and was shown much kindness on the way. Still I couldn't keep from wondering continually how the people could undertake such a (for them) huge enterprise. Perhaps I shall find out before I leave the territory.

The view we get, on the road, of Great Salt Lake is very fine. Stretching north and south a hundred miles with a width of nearly forty, surrounded by high mountains, the expanse of water is grand. The nearest point we reach to this object of attraction is near Farmington, where, if we stop, we shall be able to find a good bathing place not far off. It would pay one well to examine the banks all around the lake, which show plainly that the water once stood much higher than it does now, and to sail on or lave oneself in the liquid, which is wonderfully buoyant, as it may well be, holding nearly a fourth of its weight of solid matter, over 20 per cent. being common salt. W. H. M.

Bull Run District.

[Written for the Scientific Press.]

EDITORS PRESS:—I have previously given you a general description of this district and of the principal mines. Affairs look quite promising here now. There are about 200 men in the district and the population is on the increase, for a number of new discoveries have been made of late. The mines are looking well. Indeed, as we descend below the surface, we find better looking mineral than we did at the surface. We find, moreover, plenty of ore. There are now from five hundred to one thousand tons on the different dumps, and any quantity more in sight in the mines. Nearly thirty seven tons of ore were shipped from here last month, some of which went to Reno and some to San Francisco for reduction.

Shafts have been sunk as deep as one hundred feet, and tunnels have been run in one hundred and fifty feet, so there is no longer any doubt as to the character and continuity of the ledges. Some of the veins show native gold in the ore, which is especially true of the Montana, which carries large flakes of both gold and silver. But we have considerable base metal, and some of the minerals prove a great trouble to the miner. Thus it foiled the miners here to distinguish between galena and antimony at first, until they learned by experience.

We want mills here and capital to develop the mines. When we get these our district will make more of a noise than it has hitherto. MINER.

Bull Run, Aug. 26, 1870.

Street Pavements.

A report on this subject was made last month by a Committee of the Board of Supervisors of this city, and this has been since published. While the report does not contain definite results, for so little can really be said authoritatively as yet on this subject, yet it forms in many respects a valuable document. The stone pavements commented on, are the Belgian, Russ and cobble; the wooden ones are the Nicolson, Stow, Stafford, De Golyer, Converse, Kemp, Howard, Bartlett, Tiedeman, Smith, Keystone, Rhomboid and Cylindroid, and London; and of others, the Van Doren Concrete, Knapp Concrete, and Bonnet and Skinner Asphalt. There are also articles on different processes of preserving wood and on various kinds of wood for pavements.

Of these, the cobble, Nicolson, Stow and Perry have been tried in San Francisco. The Stow seems to have given the most satisfaction, although this is not yet a success, and if would seem that preserving the wood would be a considerable improvement. The Committee believes that sand, securely confined, furnishes the best possible foundation for wooden pavements, and that the Bethel and Robins process (represented as being substantially identical) are the best methods of preserving wood. They recommend that various pavements should be given a fair, practical trial, as the best means of determining on their respective merits.

The comparative cost of laying wooden pavements is set down as follows:

In New York.	Per Square Yard
Nicolson.....	\$4 50
Brocklebank & Trainor.....	4 50
Stafford.....	6 00
McGonegal.....	4 50
Stow.....	5 00
In San Francisco.	
Stow laid with Redwood.....	2 35
Stow laid with Robins preserved.....	2 25
In St. Louis.	
Nicolson (burntized).....	3 05
And according to other authority, it costs to lay	
Cobble pavement.....	\$1 80
Macadamized.....	45
4-inch plank.....	91%

per square yard, in this city.

The Western Union Telegraph Company has offered to loan its wires to the War Department on liberal terms for the purpose of carrying out an extended system of reporting observations of storms along the seaboard on the northwest lakes.

Academy of Sciences.

The regular meeting of the Academy was held on Monday evening, Prof. Whitney presiding. A large number of contributions were made to the cabinet. Among these may be mentioned a crawfish from the Bay, mineral specimens, a specimen from this forest of petrified trees near Calistoga, a large number of books and pamphlets, and a collection of skulls, mummified hands, painted cloths, nests, etc., which have been discovered in graves in Peru.

The consideration of the contributions occupied almost the whole meeting. Dr. Gregory Yale, in presenting the crawfish (among other things), said that it was remarkable in that it was not generally found north of Santa Barbara. In connection with the petrified wood, a description of the occurrence by Mr. Chas. Dennison, which has previously appeared, was read. But the principal topic of the evening was the matter of the Peruvian specimens. Dr. Aug. Le Plongeon who has been occupied for several years in researches in Peru, presents these to the Academy. He called attention to the shape of some of the skulls presented, which were of different races of the Ancient Peruvians living in the times of which we have now as records only a few traditions and the ruins of some magnificent monuments of art and skill. One of the skulls had no suture and another had an extra bone at the union of the occipital and frontal bones, an occurrence said by Dr. Stout, later in the evening, to be by no means uncommon. There were mummified hands which were tattooed, such having never before been discovered. There were curious paintings on cloth, the colors being still very distinct, and spinning needles, nets, an article of dress decorated with feathers, and other interesting articles.

Dr. Le Plongeon then read extracts from a pamphlet which he intends presenting to the Academy. He gave a glowing description of the old city of Cusco, with its rare old antiquities showing the great extent of art and civilization which must have existed at the time of the Inca Monarchy. The Dr. was followed by others who spoke of the present and future prospects of Peru.

Mr. Hanks showed a peculiar substance which he had received from Battle Mountain, Nevada. This had been sent him by a gentleman who stated that it runs out of the rock in a certain place, where there was collected now some two tons of the dried matter. Mr. Hanks had made a partial examination of the substance, without arriving at definite results as to its exact nature. The dried gum or resin he said, has a yellow, waxy luster and a bitter and astringent taste. On platinum foil (over a flame) it swells, melts and then burns with a yellow smoky flame, leaving a pure white ash, which reacts alkaline to test paper. It is partially, if not wholly, soluble in water, giving a deep red solution. This solution, evaporated on platinum foil, leaves, at a gentle heat, a residue like copal varnish, which at a higher heat burns like the original substance. A larger quantity treated with boiling water dissolves readily and the solution gives off the peculiar odor of the gum. The aqueous solution becomes turbid on standing. The gum has such an affinity for water that it deliquesces on being left exposed to the air. It is soluble in alcohol, giving an amber colored solution, which becomes turbid on standing, burns with a deep orange flame, without smoke, and with but little odor, leaving a resinous residue. This residue burns with a yellow smoky flame leaving a pure white ash. The exhausted residue, when calcined, gave off a smoke like that of burning wood, but without the least bituminous odor. The ash does not effervesce with acids. Under the microscope this residue resembles woody fiber and is doubtless vegetable. In the ash are found grains of sand and other mineral substances.

The substance was examined with interest by the persons present. Mr. Hanks will continue his examination until he gets satisfactory results. The occurrence of a similar appearing matter at Lake Tahoe was spoken of.

Mechanical Progress.

PNEUMATIC MESSAGE CARRYING.—The latest improvements have been made by Siemens Bros., of London. In their arrangement, "carriers are not sent backwards and forwards through a single pipe, but a circuit is made, through which the carriers always travel in one direction, and if they be not stopped by the attendant at the receiving station, they fly back to the station whence they started. The advantage of this plan is that several carriers can be traversing the pipe at the same time. Another is that the same air or gas can be continually used in the pipes. The velocity of the transmission of the carriers diminishes with the square of the length of the pipe, and the denser the air the slower it goes. Hence, on very long circuits it is an advantage to be able to use hydrogen gas, which, says Mr. Siemens is four times quicker than air at the same pressure, hydrogen being four times lighter."

BOLT-HEADING MACHINE.—We find described in the *London Engineering*, a heading machine "of American design," in one of the shops of the extensive Stamp End Iron Works, Lincoln. We quote: "This machine consists of a vertical screw, enclosed in a frame which forms guides for four 'tups' corresponding to four anvils on the sides of the machine. As the central screw revolves these 'tups' are lifted, each of them, as it reaches the top of its travel, being disengaged from the screw, and held in its raised position by a simple detent. A bolt to be headed is placed head-end uppermost in one of the anvils, and the corresponding 'tup' is released by pressing on a treadle, when it falls, and the heading die attached to it forms the head of the bolt. As soon as the blow has been struck the screw, which is continually revolving, raises the 'tup' again, ready to be again released when necessary. The four 'tups' can of course be fitted with dies suitable for different sizes and forms of heads, and the machine is a simple one, capable of turning out a large quantity of work."

DUTY OF THE CORNISH PUMPING ENGINE. At a late meeting of the North of England Institute of Engineers, J. B. Simpson, after remarking upon the fact that one of these engines had been erected in Newcastle, and describing its construction, proceeded to name the especial points in which it differed from other pumping engines. He said that "it is generally worked at a high rate of expansion; that there is a steam jacket attached to the cylinder; that the cylinder is covered with felt, and in addition to this, a covering of ashes or clay about one foot thick, and then a covering of brickwork to prevent radiation, and that there is a drain pipe from the jacket to carry away the water from the condensed steam to the boilers; that the boilers and pipes are all arranged so that there is the least possible radiation of heat—the boilers being generally covered up with fine ashes or common clay. In three trials made with the engine to ascertain its duty, it was found that the effective duty varied from 4½ lb. per horse-power per hour to 5 lb. When the balance beam was attached and the arrangements completed, it was found that the effective duty was increased from 4½ lb. to 3½ lb., equal to a saving of 16 per cent., and which, taking the feed of water at 860 gallons per minute, would amount per annum to 420 lb., and at 4s. per ton, to a saving of £80."

CAST IRON PISTOLS.—We take the following from the Birmingham correspondence of the *Engineer*:—"It is remarked that the Belgians have a very soft and easily workable malleable iron, which they know how to cast to perfection, and they make a very liberal use of it indeed in the manufacture of their revolvers. The bodies, the barrels, and sometimes even the chambers, are made of it, and every workman knows how much easier it is to file up a clean casting in soft iron than a lump of wrought iron, however shapely it may be forged. This is a very important item in the cost. Soft as the iron may be, the pistols are made very light, but the metal is evenly distributed. Even the bammers and triggers are made of cast iron. The springs have not much strength, but sufficient to strike a pin cartridge; and for pin cartridges the Belgian revolvers are invariably made."

"They are at the outset cheaper than English revolvers, but they do not last so long, and therefore in the long run they are dearer."

AN ENGLISH KNITTING MACHINE.—The *London Engineering* gives an abstract of a paper read by Mr. Arthur Paget, describing a "self acting machine for knitting hosiery by power." We may possibly give some idea of its construction by an extract from this, although we do not give the accompanying diagram:—"In the sketch the knitted web is shown hanging on the needles, which are fixed side by side in a row of the necessary length. The thread tube has a motion to and fro across the needles, and the thread deposited by it is carried down between the needles by the sinkers, so as to form a series of loops. The sinkers are of thin steel, and they are arranged so that they can rise and fall between the needles. The line of thread having been deposited over the needles, the latter retire, and the new loop over each passes under the barb or part of the needle which is turned over. Later on, a presser bar descends and closes this turned over portion, so that its point enters into a groove formed in the top of the needle to receive it; and the retiring motion of the needle still continuing, and the sinker being raised, the old loop on the needle is by the action of the 'knocking-over bit' caused to pass over the closed barb of the needle, and thus over the new loop (which is inclosed within the barb) also. The sinker then descends again, and the web being then between it and the 'knocking-over bit,' is held close to the latter as the needle advances with the barb released, the new loop being thus made to take up the position occupied by the old loop at the commencement of the circle of operations."

A LAST WORD ABOUT BOILER COMPOSITIONS.—At the annual meeting of the Institution of Mechanical Engineers at Nottingham, Eng., G. F. Marten read a paper on boiler explosions, from which we give a single paragraph:—"Much mischief is often done by the injudicious use of composition in the boiler designed to prevent incrustation, especially where there is no blow-off cock, or where its use is neglected. A hard deposit on the boiler is, in the writer's opinion, not so injurious as the softer muddy deposit produced by the composition. A hard scale is equivalent to thickening the plate, and although sufficiently mischievous, the injury to the plates is much more rapid when a thicker but more spongy deposit entirely prevents contact of the water. The money spent in boiler compositions would be better applied in securing a supply of proper water, or in filtering and purifying the water before it enters the boiler."

RUSSIAN CANNON.—A correspondent of *The Engineer* has recently visited the Abochhoff Cast Steel Works at St. Petersburg. He describes, among other things, a 9-inch breech-loading turret gun, weighing 15 tons 2½ cwt., of crucible steel, and hooped, which had fired 700 rounds, and was still without defect, except very slight scoring. In remarking upon the manufacture of cannon at these works, he says:—"The latest improvement made has been the tempering of the tube and breech piece in oil, by which process the additional tenacity imparted to the steel is very remarkable, as shown by carefully conducted experiments in the testing house. Thus for example, of two contiguous pieces of the core of an 8 in. gun, No. 165, one tested untempered gave as elastic limit 38,000 and an extension of 0.115 in. while the other piece tempered in oil stood 79,000 lb and an extension of 0.148 in."

NARROW GAUGE IN PENNSYLVANIA.—At the Thomas Iron Works at Aokendangua, Pa., is a road built to carry cinders from the blast furnaces, which a correspondent of *Van Nostrand's Magazine* thus describes:—"The road is 2 feet 6 inches gauge. The engines were built at the Baldwin Locomotive Works. The steam cylinders are 9 inches diameter, and 12 inch stroke; driving wheels 30 inches diameter with steel tires two inches thick. Our cinder cars are four-wheeled, weighing when loaded 3 tons 5 cwt., gross; wheels only 16 inches diameter. The engine weighs, when ready for work with tank full of water, 8 tons 4 cwt., gross. One of them will haul with ease up the gradient of 211 feet per mile, 8 of the cinder cars, making an aggregate of 26 tons, and that with a boiler pressure of only 120 to 125 pounds per square inch."

Scientific Progress.

TEST FOR PLANE SURFACES OF GLASS.—The following is from Prof. Gibbs' "Optical Notices" in *Silliman's Journal*:—"When a plano-convex lens of long radius of curvature is placed upon a plane surface of glass and the system is illuminated by an obliquely incident beam of monochromatic light as, for example, by a sodium flame, the well known phenomenon of Newton's rings is observed with remarkable distinctness and perfection of definition. The symmetry of the rings will depend, in part, on the perfection of the figure of the lens, in part on the plane surface. An extremely minute deviation from a perfect plane will produce a marked distortion of the circular figure of the ring nearest the center. That this distortion is or is not due to the lens may be determined by rotating the lens round its optical axis normal to the plane. No change of figure will be seen if the lens is perfect in form and the inequality is in the plane surface only. Different parts of the plane surface may of course be tested in succession, by moving the lens from point to point."

BROMIDE OF SODIUM.—In reference to the preparation on the large scale, of this substance, which now promises to be extensively used in medical practice, M. Castelhaiz says: "The best plan is to prepare first, bromide of ammonium, by causing bromine to fall drop by drop into dilute, but pure, liquid ammonia contained in a series of Wolff's bottles, in order to prevent the loss otherwise inevitably resulting from the volatilization of the products formed by the great heat disengaged on the bromine and ammonia uniting. The liquids, after saturation, are evaporated in a cast-iron retort, to which an earthenware receiver is fastened, wherein are collected the vapors of water, any excess of ammonia, and some bromide of ammonium which is accidentally carried over. The bromide of ammonium thus obtained is converted into bromide of sodium, by being mixed with pure carbonate of soda, and the application of sufficient heat to volatilize and sublime the carbonate of ammonia formed by the reaction. This mode of preparation yields after re-solution of the bromide in water, and evaporation similar to that used for chloride of sodium, perfectly pure and anhydrous bromide of sodium."—*Chemical News*.

CONSERVATION OF FORCE IN PHYSIOLOGY.—The following is an extract from M. Mayer's discourse at the Re-union of Innsbruck:—"The principle of the conservation of matter and force has all its rigor, without doubt, in physiology. The living organism can create or destroy neither matter nor force, nor can it transform one into another the known elements of chemistry; but vegetable can, by peculiar processes, produce ternary and quaternary combinations, which, for the most part, cannot be obtained by artificial means. There certainly are in living nature, creations, generations, in a word, activities, for anything analogous to which in the domain of physics we should seek in vain. So that the principle *ex nihilo nihil fit*, so rigorous in physics, can no longer be maintained with so much certitude in physiology, and still less in philosophy. * * The French physicist, Adolphe Hirn, who, at the same time with Joule, Colding, Holtman and Helmholtz, discovered the mechanical equivalent of heat, arrived at the conclusion, which I find as beautiful as true, that there are three categories of existence: first, matter; second, force; third, the soul, or the spiritual principle. When once we have succeeded in realizing that there are not only material objects, but also forces, and forces in the definite, accurate sense of modern science, as indestructible as the substances of the chemist, we have but one step further to take, and that perfectly natural, to recognize and admit spiritual existences."

GASES UNDER PRESSURE.—The following is from the *Chemical News*: Cailletet has studied the compression of air and hydrogen from 1 to 800 atmospheres. Up to 80 air is more compressed than it should be if it followed the law of Mariotte, and at 680 it occupies only two-thirds of the space which it ought theoretically to do. In these experiments, the glass tube containing the gas was enclosed in an iron one, and was lightly girt. The mercury used to transmit the pressure whitened the gilding, thus indicating the point to which the gas had been compressed.

CAUSE OF THE BRILLIANCY OF FLAME.—Among the good thiaga recently exhumed by Prof. Wurtz are the following "forgotten results" of Doebereiner:

"HYDROGEN GAS, under common pressure, burns both in atmospheric air and oxygen gas, with a feeble and scarcely visible flame. The flame becomes more brilliant only when brought into contact with a more solid substance, unsuceptible of becoming red hot, such as platinum foil, oxide of zinc, lime, magnesia, etc. Davy infers from phenomena of this sort, that the brilliancy of all flame is owing to the presence of a solid incandescent substance, which is formed or disengaged during combustion, and that a gaseous substance never can be heated so as to emit a vivid light. The cause of these opposite phenomena may be found in the different modes by which heat acts upon various substances; elastic fluids and volatile substances expand by enfloride and disperse it, while solid bodies resist the repulsive action, and absorb and condense the heat so as to become luminous. But, if this view be correct, gaseous substances, disengaged by combustion, ought, when forcibly restrained from expansion, to exhibit incandescence and splendor. An experiment, at once simple and brilliant, confirms the justness of this conclusion. If a mixture of two volumes of hydrogen and one of oxygen be confined in a strong globe of one or two cubic inches in capacity, perfectly dry internally, and well closed, and then kindled, it burns with as brilliant a light as that of phosphorus in oxygen gas. If the detonating gas be compressed into the globe to two atmospheres, it emits, when kindled, the splendor of lightning. Even in open day, the effect is like that of the most vivid lightning; and by night, it is so much like a burst of sunshine, that oyster shells heated with sulphur become phosphorescent when exposed to it. If there be moisture in the globe, or if the cock be left open, the light is very feeble, because in the first case the light is absorbed by the moisture, and in the second, dispersed by the sudden exhalation. The kindling of the explosive mixture is best effected by the electric spark. * * The wires of such an apparatus should approach the nearer as the gas is more compressed, for the spark in condensed gases will not pass through so great a space. The facts induce the author to seek for the cause and condition of the brilliancy of flame, not in the presence of solid, incandescent matter, but in the forcible accumulation or condensation of caloric, and he thinks it not hazardous too much to propose this point of view as a photological axiom. He has not examined the luminous effect of burning, in this manner, gases, which by combustion with oxygen, give permanently elastic products. It is rare to find globes of glass strong enough, and of uniform resistance. Tubes are not suitable, as they present too large a surface, and consequently absorb too much heat."

SPONTANEOUS GENERATION.—H. Cbarlton Bastain has described in *Nature* some recent experiments of his, intended as a modification of Schwann's. He says:—"The withdrawal of all air from the flasks in which the boiled solutions were contained, rather than the admission of calcined air, seems to be the kind of modification which was desirable. Then the contamination of the boiled fluids with possible atmospheric germs would be as effectually provided against as if air had been allowed to enter after it had been calcined, and there would be even greater freedom for the commencement of evolutionary changes, on account of the diminished pressure upon the fluids *in vacuo*." A number of two ounce flasks, thoroughly cleaned, were three fourths filled with different filtered liquids, such as beef juice, vegetable infusions, and saline solutions. The necks of the flasks were then, by means of blowpipe and spirit lamp, drawn out until each was less than a line in diameter. They were then cut across, and the contents of each flask boiled for some minutes, the neck being held in the spirit lamp flame; its minute orifice was finally hermetically sealed with the blowpipe, and the heat immediately withdrawn from the body of the flask. Mr. Bastain thinks that even if the vacuum thus produced should not be quite perfect, the air which entered having passed through the blowpipe flame, would have been effectually calcined. The flasks thus prepared were suspended in his study, and kept at a temperature of from 75° to 86° Fah.; one set for four hours at 300°. In most of them, including some of these last, living organisms were found.

Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

California.

ALPINE COUNTY.

FULL FORCE.—*Miner*, Aug. 27th: The Mt. Bullion tunnel will start up with three shifts and two extra men, on Thursday.

EXHEQUER.—This Co. has bought D. Davidson's mill on Silver Creek for \$20,000, half cash and half stock.

TARSHISH.—This morning the workmen in the lower tunnel struck into a large pocket of very rich soft ore, identical with that in the upper works.

LEVATHAN.—Affairs go steadily forward and an additional force is to be put on.

AMADOR COUNTY.

BUTTE CANAL.—*Ledger*, Sept. 3d: Another gang of one hundred Chinaman have been put to work.

BUTTE COUNTY.

FORBESTOWN.—Telegram, Sept. 2d: Bowen & Gaskell's claim, realized \$10,000 from the first cleaning. One piece of gold weighed nine ounces. They have been three years opening the mine, at great expense, but will get their money all back in a few weeks.

CALAVERAS COUNTY.

PALOMO.—*Chronicle*, 3d: We learn that the proprietors have shut down one of their batteries and commenced sinking the main shaft one hundred feet deeper.

CHLORINATION.—Garland's Chlorination works, in Lower Rich Gulch, are now in successful operation. And the sulphurets from the Palomo and Alexander are being worked. We are informed that \$75 per ton is the average yield.

BRO BAR.—This is again proving itself rich. George Kelton, has for years been working the principal mine with poor success. During the present dry season, he succeeded in turning the river, on the Calaveras side, and has leased the mine to Chinamen "on shares," they to pay him forty out of every hundred dollars taken out. We are informed that the yield has been \$100 per day for a considerable time.

NEW MILL.—The mill of Lewis & Bro. near Railroad Flat, commenced operations on Monday. The battery, of five stamps, will be employed for crushing low grade ores. All of the better rock is taken to West Point and worked in Thoss' mill.

INDEPENDENCE.—Cor. of same: Sundermeier & Co. have run a level south on their vein one hundred feet. They have a large pile of good looking rock on dump. Gamble & Co. have been running a level south eighty feet from their main shaft. They are at present raising surfaceward. Cornell's claim, has a shaft fifty feet deep. They are still sinking, and quartz is looking well. Burr's Steam Mill has ceased operations. W. V. Clark's Mill, so soon as it is in perfect order, will be set to work on custom rock at three dollars per ton.

EL DORADO COUNTY.

GOLD DUST.—*Democrat*, Aug. 27: Shipped through W. F. & Co. from Placerville during the month ending 24th, \$37,880.

INYO COUNTY.

LONE PINE.—*Independent*, Aug. 29: The works of Cervantes & Co. consist of a battery of five stamps, an amalgamating pan, one concentrator, galamadore furnaces, and a large basso, or furnace of the old Mexican pattern, with blower. They start up this week. The Cerro Gordo ore will be hauled to the lake, 8 miles, then boated to within 5 miles of the works, whence it will be hauled again.

Assays of Kearsarge ore, by Bousfield, show a total gold and silver per ton of from \$130 to \$3,400.

LASSEN COUNTY.

THE SUSANVILLE *Sage Brush* says that J. S. Ward saw, at the new mines near Big Valley, \$780 weighed, which was the result of three hours' work of one man with a rocker; also one pan of dirt washed from which was obtained \$157, counting gold at \$16 to the ounce.

MARIPOSA COUNTY.

ITEMS.—*Gazette*, Sept. 2d: The John Snow mine, near Sebastopol, continues to yield largely: Jarvis Streeter, who has leased half the mine for one year, and Ben Aeilkema, owner of the other half, took out \$950 last week. The rock is crushed with a hand mortar... Law & Garvey, of Buckeye, have just erected a whim over their mine, and hereafter will be troubled but little from water. They contemplate working their mine on the eight-hour shift system.

NEVADA COUNTY.

ALTA HILL.—*Gazette*, Aug. 30th: The Mount Hope Gravel Co. have struck gravel four feet thick which yields four bits to the pan. In three hours yesterday, they took out \$200.

GRANITEVILLE.—Same of Sept. 2d: Black and Irwin are taking out twenty-five tons of excellent ore daily from the Banbury ledge. They run their mill day and night. The Erie Co. are putting up a new 10-stamp steam mill. They have a 4-foot ledge of \$17 ore.... The Birchville have their steam hoisting works completed, and intend sinking an incline 400 feet. They have a ten stamp steam mill, and their rock has paid \$15 to \$40 a ton.... The Forest Rose are running a tunnel for their ledge, to tap it at a depth of 150 feet.

OMEGA.—*Transcript*, Aug. 30th: John Hinds brought down yesterday between \$50,000 and \$60,000 worth of gold, the result of the final clean up for the season of the Omega Water and Mining Co.

HYDRAULIC YIELD PER CUBIC YARD.—Marselus & Maltman, of the Manzonia hydraulic claims, have made an estimate of the number of cubic yards of earth washed in their claims during the season, and thence make the average yield per cubic yard, 15 cents.

PERRIN.—Grass Valley Union, Aug. 30th: Perrin's mill sends in \$1,500 worth of gold cleaned from the plates below the batteries. This is a week's run.

ENTERPRISE.—In March, this Co., at Buena Vista Slide, commenced a tunnel to find a bed of gravel known to be in the hill. The tunnel has been put in 550 feet. At 370 feet the workmen began to raise. Last Thursday the miners struck through. Saturday, the water had drained sufficiently to get at the gravel. A bed four feet thick, was found, and a bushel of it washed out gold to the value of \$3.25.

GREEN MOUNTAIN CO.—This Co. works the Greenhorn ledge on Osborne Hill, which up to April last had been idle for 13 years. Since that time, the amount of rock crushed is 242 tons with a result of \$25,275.05. The shaft is down 60 perpendicular feet. The ledge is one foot wide.

EUREKA.—Same of 31st: The mine gives for the twelve days ending Saturday, \$26,500. The amalgamators below the batteries, only, were cleaned up.

GREENHORN.—The Co. have suspended operations until water can be procured for crushing purposes. Work on the shaft has stopped until steam hoisting works can be erected.

THE SITUATION.—The Same of Sept. 1st: Wisconsin shaft is down 500 feet.... The Idaho is running day and night.... The Empire makes a good showing.... The Seventy-third sent up on Tuesday another batch of specimens worth \$1,000. The unselected rock will go \$100 to the ton.... Last run of the Greenhorn gave \$2,000 from 74 tons.... The Bowery has yielded \$83 per ton average from top down.... Alison Ranch mill is constantly running.... So is the North Star.... Spring Hill mine has applied for a patent. The ledge is 2 feet thick.... Combination Co's tunnel is in 150 feet.... Phoenix rock shows well in free gold.... Phil. Roberts & Co. four in number, on Little Wolf Creek, work their own gravel claims alone, and get \$5,000 every winter.... The Sulphurets works of Hill, of Days & Clark, of Burr, and of the Eureka Co., are all running most of the time. Wolf & LeClair have works of a new style just finished.

SEVEN-THIRTY MINE.—Same of Sept. 4th: A crushing of 39 tons of quartz, has just been put through at the Gold Hill mine. The result was \$4,927.00, or \$126.35 per ton.

PLUMAS COUNTY.

ITEMS.—*Appeal*, Sept. 3d: Heath and Freeman are putting up a 24 stamp mill in Indian Valley, and a 32 stamp mill is to be erected in American Valley. New ledges are frequently discovered.

SAN BERNARDINO COUNTY.

MORE ORE.—*Guardian*, Aug. 27th: On Thursday, a wagon load of ore arrived from Clark District. We must say that, for richness, it surpasses anything we have seen in California.

SAN DIEGO COUNTY.

BULLION FROM JULIAN.—*Union*, Aug. 31: A. Pauly & Sons received during the week ending Tuesday, 105½ ounces of gold bullion—83½ ounces from the Parsons & Cotton mill, and 22 ounces from the McMechan mill.

GILA PLACER MINING CO.—Messrs. Nickerson & Pettingill, have made arrangements to erect machinery to raise water from the Gila to work the placers at old Gila City, of which the Company own 160 acres.

SIERRA COUNTY.

CAMPIONVILLE.—*Messenger*, Sept. 3d: Mr. Ramm, a member of the Humboldt Co., at American Hill, showed us some specimens which are exceedingly rich. The shaft is down 220 feet, add tunnel run in on the ledge, about 175 feet. They are building a mill to run by a Hurdy Gurdy wheel with 394 feet pressure,

SISKIYOU COUNTY.

ITEMS.—Yreka Union Aug. 31st: Lash & Co., have made one clean up since starting their new mill. They crush from 12 to 15 tons every twenty-four hours.... There are now on the Humbug, between French Flat and the Klamath, but one company of white miners. This is Spangler, Moore & Co. Their claim has yielded \$12 per day to the hand all summer.... The number of Chinese on the Humbug is increasing.... On Virginia Bar are 3 companies at work this season.... The streams are all lower than ever before.

TRINITY COUNTY.

ITEMS.—*Journal*, Sept. 3d: The prospecting shaft is down 50 feet.... Messrs. Lorenz and Lucassen have contracted to work the McGillivray claims on shares. McGillivray furnishes the water, lumber, etc.... A number of Diggers are at work in the bed of Hayfork creek, and occasionally make four or five dollars in a day panning out.

TUOLUMNE COUNTY.

RICH.—*Sonora Democrat*, 3d: J. W. Anderson, in working an abandoned quartz vein on Curtis' Creek, last week, took out some very rich quartz. The specimens shown us were fully one-half gold.

YUBA COUNTY.

ITEMS.—*Appeal*, Aug. 31st: The prospects of the Dexter Co. are good. One hundred and fifty tons paying rock in sight.... R. L. Cray will have the Blue Point tunnel, at Sucker Flat, completed in six weeks. It will be a mile long, and furnish facilities for prospecting a strip of country two miles in length.

Nevada.

COPE DISTRICT.

ITEMS.—*Elko Independent*, Sept. 3d: At Lone Mountain, 25 miles north of Elko, ore is being taken out for shipment.... Hope Ledge, at Bull Run, is showing very fine ore.... Norton mill approaches completion.... Drew's mill, at Mountain City, is at work on rich ore from the Ida Gossage.... Machinery is being set up in the Vance mill.

HUMBOLDT.

ITEMS.—*Register*, 3d: L. C. Pease shipped 14 tons ore from Winnemucca district.... L. B. Webb, at Gold Run, has purchased the first extension of the old Golconda mine.

RAILROAD.—Buell's offers for certain mines have been accepted. He will immediately commence operations.... The Dalles mine shows very rich chloride ore.... The Bullion still looks well. A large force is at work.

ELKO DISTRICT.—*Silver State*, 2d: The Butte mine is looking better than ever. The vein is from three to five feet in thickness, of exceedingly rich ore, and there is now 1,000 tons on dump. The Alpha mine is still yielding rich ore in considerable quantities. The Hard Cash is developing into a valuable property. The south shaft shows a vein two and a half feet in thickness at depth of 25 feet.

The Monitowoc and Arizona mines are sending to mill 70 tons of ore per day.

REESE RIVER.

SILVER BEND.—*Reveille*, Sept. 1st: W. F. Leon, of the Eldorado mine, is in this city with 75 tons of ore, to be reduced at the Manhattan mill, and it is estimated that the average will reach \$200.

HIGH.—A lot of ore from the Victorino mine in Bunker Hill district, yielded \$190.59.

BULLION.—During August the Manhattan mill produced bullion of the value of \$123,000. As the works are closed on Sunday, this gives \$5,500 per day, for a mill of twenty stamps.

MINERAL HILL.—*Elko Independent*, Aug. 31st: D. R. Northey reports a rich discovery last week on the west side. Same, of 2d, says the new mill is nearly ready, and has already whistled. New discoveries are daily made.

It is reported that a new company will soon organize here for the reduction of silver ores, and will open the Boston mill. The cause is said to be the high charges of the Manhattan Mill Co.

WASHOE.

OVERMAN.—*Enterprise*, Sept. 4th: Very little has been done toward the development of the body of ore struck. Connection will probably be made during the week, which will give a good supply of good air, and the value of this new discovery determined. The ledge where striking is six feet in width and contains high grade milling ore with a small quantity of the richest on the Comstock, showing considerable wire silver.

OPHIR.—The rich ore reported last week near the Walsh shaft is still of uncertain value.

HALK AND NORCROSS.—About 200 tons per day extracted, the greater portion from the 7th level.

OCCIDENTAL.—The new mill is kept constantly running on ore from the lower level.

CHOLLAR-POTOSI.—Gross yield for the week, 1,157 tons—sample assays being \$70. Eleven hundred and sixty tons shipped to mills on the Carson. The mine continues to yield well from every portion where it is worked. The bullion yield for the last week is \$83,000, and for the month, \$249,552.

GOULN & CURRY.—About 70 tons per day extracted, the greater portion from the newly developed body of ore on the D street level. Six to eight tons per day is sacked, which will pay several hundred dollars per ton.

CROW'S POINT.—Daily yield 40 tons, from the upper levels. It shows some improvement in quality. A drift south at 1,100 foot level has been commenced.

KENTUCK.—No work has been done for several weeks. Good ore is known to exist near where the fire occurred, which is still burning.

YELLOW JACKET.—Daily yield 200 tons, from the 800 and 900-foot levels. Drifting at the 1,000 foot level northward is vigorously prosecuted.

CONSOLIDATED VIRGINIA.—The difficulty from water in the lower tunnel has been overcome, and drifting progresses.

SACRAMENTO & MEREDITH.—All matters in connection with the mine and mill seem to be satisfactory.

SIERRA NEVADA.—The bullion yield continues to improve and the works progress as usual.

BELCHER.—The usual amount of prospecting at the 73d and 152-foot levels. The work of opening the 420-foot level progresses.

SAVAGE.—Daily yield 35 tons, rather low grade, from the lowest level.

WHITE PINE.

REVIEW.—*News*, Sept. 4th: Mining affairs have been more healthy than at any time since the organization of the District—legitimate operations only being undertaken. Many of the best claims have passed into hands of wealthy companies, and these are consummating plans upon a basis insuring permanency.... The Matteson furnaces are sure to be a success. The portions of the machinery ordered from the East will soon be on the ground. Seven mills are now running, and a 40-stamper will soon be in course of construction.... The bullion shipment for the past week has been \$50,401.38.

ITEMS.—The Ward Beecher is working 30 men and taking out 30 to 40 tons ore daily, which nets \$40 a ton. Friday, was struck ore which resembles the rich ore of the Eberhardt, and large pieces were taken that were nearly pure silver.... In Silver Wagon, the ore from shaft No. 4 is paying \$80 a ton.... Last working of Hidden Treasure ore gave \$74 per ton.... Schorharie turns out six tons daily of ore that looks worth \$40 per ton.... Matilda ledge on the surface is 18 feet wide—assays from bottom of shaft, where it is 4 feet wide, \$80.... Bowie & Brown, Blue Hill, has 40 tons on dump, assays from which, show \$250 per ton.... Eberhardt has only 4 men employed; merely to keep things in order.... Silver Wedge will increase its force next week.... Aurora South has an immense quantity of ore exposed.... Of the Base metal mines, Trench is taking out very rich ore. The furnace will fire up this month.... Jones and partner, near the Trench, in a mine belonging to Col. T. W. Robinson, are taking out some of which is worth \$1,000 per ton.... Gloucester has 40 tons first class ore on dump.

PROCE BULLION.—A Hamilton telegram of Sept. 5th: says W. F. & Co. shipped 14 bars bullion to-day from the Meadow Valley mine.

EUREKA.—*Sentinel*, Sept. 3d: Col. Robbins has purchased the Fairview, which bids fair to be one of the big mines.... The mill of Carpenter & Co. at Sierra will soon be running.... Fred, Elliott of Reno has purchased the Emerald dump, and is sucking it. It will average \$300 per ton.... The Dunne furnace and separating works are progressing.... A rich discovery made within the last 30 days on a hill west of Eureka, shows ore up to \$780 per ton.... Several other strikes are noted.

Montana.

PHILIPSBURG.—*Helena Gazette*, Aug. 29th: The small "White Pine Furnace" did so well that Mr. Saunders says he will erect a ten ton furnace of the same pattern immediately.

HIGHLAND.—Wm. Flowers came in yesterday, bringing two hundred and fifty ounces from the astras on the Only Chance lode; which, with 150 ounces previously, make 400 ounces as the total production of the astras for one month.

ANGENTA.—The furnace is turning out two hundred pounds of silver, or six thousand dollars worth monthly.

PILGRIM BAR.—Cor. of same: The clean nps last week were about \$3,700 to each claim.

CANLE CITY.—*New North-West*, Aug. 26th: The mill will start up again soon. The shaft will be sunk deeper. Some 56 miners are at work.

TOP O'DEEP.—Water is very light. Walter, Eddy & Co. are taking out \$20.00 per day to the man. Waterman & Co. are taking out plenty of dust. Allen & McGee have struck rich pay on No. 5. Gibbs & Co. are taking out \$200 to \$400 per day with 6 men.

ITEMS.—Virginia Montanian, Aug. 25th: Gilbert and Co's claim in Lincoln Gulch pays \$2,000 per week.... A nugget of the value of \$750 was taken out of Pierce and Wilber's claim in Wigwam Gulch.... New diggings on Beaver Creek have 3 feet gravel that prospects seven cents to the pan. Ninety claims have been recorded....

MANISON COUNTY.—On Wisconsin Creek, Hanna, Orr and Co. are working nine men, pipping and ground sluicing, and averaging to each hand \$9 to \$12 per day.

Helena telegram, Sept. 6th: A few days since Bohn and Co., of this city cast a gold brick, weight 2,282 ounces. The coin value is \$41,829.

Arizona.

BRADSHAW DISTRICT.—Prescott *Miner*, Aug. 20th: Messrs. McCracken, Taylor, Hogle and Fine got to town Monday with one hundred and twelve ounces of gold, worth \$17 per ounce, which they had just cleaned up from six and one-half tons of Del Pasco ore, ground by them in an astras. This makes the yield per ton \$291; and if the gold panned out be added, over \$300.

ITEMS.—The Bureka ten-stamp mill will be started early the coming week.... The Big Bug mine is running. The mine is yielding rich ore.... The Vulture is doing splendidly.... A new ledge has been near the head of England gulch, which promises well.... The placer miners have plenty of water.... At Weaver, Mexicans are taking out huge pieces of gold.

WICKENBURG.—Cor. of same: The first ton of ore crushed from the Mayflower, by an astras, gave \$126.64 in gold. Another run of four tons will soon be cleaned up.

Colorado.

ITEMS—Boulder News, Aug. 31st: Eric Bot-tolton cleaned up 25 1/2 ozs. of gold from one cord of ore, from a lode recently discovered on Gold Hill. . . . Joseph Pfeiffer got 22 ozs. of 8 1/2 r tori, from a cord of top ore from No. 1 north, on the Central.

ITEMS—Herald, 31st: The Prize lode has within the last two weeks yielded over 30 tons of first class ore, besides 10 cords of stump-mill ore, which runs from 5 1/2 to 6 ozs. . . . Alex. Campbell expects to take out 55 ounces of gold this week, at an expense of \$275. He has taken out on the 20th of June to the 20th of August 35 lbs. and 3 ozs.

GRAND ISLAND.—The Cariboo lode produced \$6,700 from July 1st to Aug. 19th. The mine has been holed for 30 days at \$125,000. . . . The lode has 18 inches ore, worth \$1,400 per ton. . . . The Penmarver shows similar ore but not so much of it. . . . The Boulder County will yield an immense amount of \$75-ore. . . . Trojan is about the same thing.

The Register of 31st says: Ben. Hinds & Co., who discovered the Trojan, have struck it rich. Ulysses Pugh shipped a lot of ore from the Sovereign lode yesterday, for reduction. Prospector are coming in at the rate of between forty and fifty a day.

Idaho.

LOON CREEK.—New North West, Aug. 26th: We learn that there are 400 to 500 miners in the camp—plenty of water. The claims are paying as follows: Lundy's \$17 per day; James Forrester, Tuttle's & Dyer's, \$30; Pat Kimley's, \$22; Jas. Keenan's, \$15; Mullan & Co's, \$17; Chins B. Arthur's, \$17. Forrester, Tuttle & Dyer took out \$5,000 in one week, with 30 men. Charles & Murray took out 100 ounces in one week, 10 men working. The gold assays \$17.20 coin. About three miles are being worked. Claims below are paying five to eight dollars per day.

OWYHEE.—Avalanche, 27th: Work suspended on the Poorman and the Empire. . . . Chariot is yielding \$125-ore. . . . Maloney shaft is 160 feet deep. The dump shows 100 tons rich ore. . . . Last Idlewild ore worked \$58 per ton.

Lower California.

SAN RAFAEL.—San Diego Union, Sept. 1st: Several small parcels of gold dust have been brought up during the past week. We learn that an exceedingly rich quartz lead has been discovered in that section.

A telegram of 5th, says J. J. Miller reports that miners picking dirt 3 miles to water make wages, and some as high as fifteen dollars per day.

Machinery for the copper mines is to be shipped from S. F. by the Lower California Colonization Co.

Oregon.

STEAMBOAT DIGGINGS.—Jacksonville Sentinel, Sept. 3d: Al. Sturges exhibited to us, several large nuggets, and over \$800 of amalgam gold. They have been to work at their claims for nearly two years, but have struck it at last.

Utah.

SALT LAKE Telegram, Aug. 31st:—Thirteen ear loads of ore from the Eureka mine, Little Cottonwood left this morning, part going East and part going West.

Another, Sept. 1st: A very rich silver ledge has been discovered at Rush Valley, fifty miles west of this city, said to exceed anything yet. The people in that section are much excited and are leaving their farms. Mines on other ledges near are leaving them for the newly discovered which are five miles from Gen. Connor's mines at Stockton.

TINTIC.—The Salt Lake Tribune says the "Mammoth Lead" Co., sent two tons ore to San Francisco, which yielded \$120 per ton. A piece from same lead assayed fifty-six dollars in silver. Croppings from the "Union" assayed seventeen dollars in silver.

The San Francisco Glass Works.

The San Francisco glass works, which were destroyed by fire some two or three years since, on Townsend street, between Third and Fourth, are now being rebuilt near the old site at the foot of Fourth street.

The works will be in operation in a few days. From 30 to 40 men and boys will be employed, and from two to three hundred dollars worth of ware turned out daily; consisting of all kinds of green and black hollow ware, such as demijohns, carboys, wine and brandy bottles, soda bottles, patent medicine bottles, etc., etc. The proprietors of the works are Messrs Newman & Duval. The old works, under the skillful management of Mr. Newman, acquired a very high reputation for the work turned out, having taken the Gold Medal of the State Agricultural Fair at Sacramento, and of the Mechanics' Institute Fair of this city. We are pleased to learn that these works are to be started again, and under more favorable auspices than before.

Large amounts of glass ware, such as will be made at this establishment, are now being imported into California, much of which will be saved to the State by the successful establishment of these works.

Notes on Contributions to our Cabinet.

We have received quite a number of contributions lately, but have been unable to describe them as promptly as we have desired. Some of them are very valuable and interesting, as the collection from Utah, which includes Nos. 466 to 472, and which has been very kindly sent us by the Salt Lake City Museum; except No. 467, which was given by President Young.

No. 466.—Agricultural products of Utah, received from the Museum at Salt Lake City. These are specimens of wheat, barley, beans and peas.

No. 467.—Silk cocoons, received from President Brigham Young. These were raised by the donor on his farm and silk cocoonery this year.

No. 468.—Specimens of goods manufactured at the woolen mills of Brigham Young, Jr., and at the Ogden Mills. It would surprise many of our readers to see what good qualities of goods are made in our sister territory.

No. 469.—Specimens of leather manufactured at Salt Lake City by Wm. Jennings. Leather was one of the first articles manufactured by the Mormons in Utah, and their "Valley Tan" has become noted.

No. 469.—Bisquit, or earthenware which has been once baked, but not yet glazed; from the Salt Lake City Pottery.

No. 470.—Specimens of the FIRST TYPE made by machine in Salt Lake City. These were manufactured in June, 1870, and are most interesting historical curiosities.

No. 471 embraces a number of pigments.

No. 472.—Under this number we place the collection of minerals from the territory. We have here granite, limestone (two varieties), sand-stone (very fine grained), obsidian, kaolin, gypsum, (scapolite), rock salt, moss agates and carbonate incrustations; coal, sulphur, galena, malachite, red oxide of copper, hematite, limonite and magnetite; also a small piece of lead obtained from Utah ore.

No. 473.—Very fine grained galena, from Bingham Canon; galena from the Caledonia ledge at Little Cottonwood, owned by Coverington & Co.; and a specimen from the Emma ledge, at the same locality, owned by the Walker Brothers.

No. 474.—Some small, but pretty, specimens of gold and sulphurets. Received from Mr. Thomas Ryan, of Scott Bar, Siskiyou county. The claim is located on the east side of Scott River. The ledge is in slate, runs N. E. and S. W., and is from 3 to 6 feet wide. There are other ledges in the same locality which are reported rich. The method of working at present is very rude. The ground about the quartz is sluiced off and the pay rock is pounded in a hand mortar. The principal part of the work is done in the spring when water is plenty. Mr. R. says that "this claim has, to my own knowledge, yielded, within the last seven years, forty thousand dollars."

"Under this heading we shall continue to mention and describe, according to merit, such specimens of ores, minerals, fossils, curiosities, etc., as may be sent to us by mail or express prepaid. Each article will be numbered, marked with the name of the donor and the locality, and placed in our cabinet. A full account of the place, occurrence, etc., adds much to the value of such specimens."

The North Pacific coal mines, situated between Helena and Blackfoot city, Montana, are reported as furnishing coal of an excellent quality.

The Dayton Journal says that the bones of an animal, determined by Prof. Leidy of Philadelphia to be a serpent, have been lately found on the Patterson farm near Dayton.

GEN. SHERMAN'S ARRIVAL, on Wednesday of this week, evoked a great amount of enthusiasm. The General came on to participate in the celebration, by the Pioneers, on Friday, of the twentieth anniversary of the admission of California into the Union.

The New Patent Act.

AN ACT TO REFORM, CONSOLIDATE AND AMEND THE STATUTES RELATIVE TO PATENTS AND COPYRIGHTS.

APPROVED, JULY 8, 1870.

[CONTINUED FROM PAGE 115.]

Sec. 41. And be it further enacted, That whenever on examination, any claim for a patent is rejected for any reason whatever, the Commissioner shall notify the applicant thereof, giving him briefly the reasons for such rejection, together with such information and references as may be useful in judging of the propriety of renewing his application or of altering his specification; and if, after receiving such notice, the applicant shall persist in his claim for a patent, with or without altering his specifications, the Commissioner shall order a re-examination of the case.

Sec. 42. And be it further enacted, That whenever an application is made for a patent which, in the opinion of the Commissioner would interfere with any pending application, or with any unexpired patent, he shall give notice thereof to the applicants, or applicant and patentee, as the case may be, and shall direct the primary examiner to proceed to determine the question of priority of invention. And the Commissioner may issue a patent to the party who shall be adjudged the prior inventor, unless the adverse party shall appeal from the decision of the primary examiner, or of the board of examiners-in-chief, as the case may be, within such time, not less than twenty days, as the Commissioner shall prescribe.

Sec. 43. And be it further enacted, That the Commissioner may establish rules for taking affidavits and depositions required in cases pending in the Patent Office, and such affidavits and depositions may be taken before any officer authorized by law to take depositions to be used in the courts of the United States, or of the State where the officer resides.

Sec. 44. And be it further enacted, That the clerk of any court of the United States, for any district or Territory wherein testimony is to be taken for use in any contested case pending in the Patent Office, shall, upon the application of any party thereto, or his agent or attorney, issue subpoenas for any witness residing or being within said district or Territory, commanding him to appear and testify before any officer in said district or Territory authorized to take depositions and affidavits, at any time and place in the subpoena stated; and if any witness, after being duly served with such subpoena, shall neglect or refuse to appear, or after appearing shall refuse to testify, the judge of the court whose clerk issued the subpoena may, on proof of such neglect or refusal, enforce obedience to the process, or punish the disobedience as in other like cases.

Sec. 45. And be it further enacted, That every witness duly subpoenaed and in attendance shall be allowed the same fees as are allowed to witnesses attending the courts of the United States, but no witness shall be required to attend at any place more than forty miles from the place where the subpoena is served upon him, nor be deemed guilty of contempt for disobeying such subpoena, unless his fees and traveling expenses in going to, returning from, and one day's attendance at the place of examination, are paid or tendered him at the time of the service of the subpoena, nor for refusing to disclose any secret invention or discovery made or owned by himself.

Sec. 46. And be it further enacted, That every applicant for a patent or the refuse of a patent, any of the claims of which have been twice rejected, and every party to an interference, may appeal from the decision of the primary examiner, or of the examiner in charge of interference, in such case, to the board of examiners in chief, having once paid the fee for such appeal provided by law.

Sec. 47. And be it further enacted, That if such party is dissatisfied with the decision of the examiners in chief, he may, on payment of the duty required by law, appeal to the Commissioner in person.

Sec. 48. And be it further enacted, That if such party, except a party in interference, is dissatisfied with the decision of the Commissioner, he may appeal to the Supreme Court of the District of Columbia, sitting in banc.

Sec. 49. And be it further enacted, That when an appeal is taken to the Supreme Court of the District of Columbia, the appellant shall give notice thereof to the Commissioner, and file in the Patent Office, within such time as the Commissioner shall appoint, his reasons of appeal, specifically set forth in writing.

Sec. 50. And be it further enacted, That it shall be the duty of said court, on petition, to hear and determine such appeal, and to revise the decision appealed from in a summary way, on the evidence produced before the Commissioner, at such early and convenient time as the court may appoint, notifying the Commissioner of the time and place of hearing; and the review shall be confined to the points set forth in the reasons of appeal. And after hearing the case, the court shall return to the Commissioner a certificate of its proceedings and decision, which shall be entered on record in the Patent Office, and govern the further proceedings in the case. But no opinion or decision of the court in any such case shall preclude any person interested from the right to contest the validity of such patent in any court wherein the same may be called in question.

Sec. 51. And be it further enacted, That on receiving notice of the time and place of hearing such appeal, the Commissioner shall notify all parties who appear to be interested therein, in such manner as the court may prescribe. The party appealing shall lay before the court certified copies of all the original papers and evidence in the case, and the Commissioner shall furnish it with the grounds of his decision, fully set forth in writing, touching all the points involved by the reasons of appeal. And at the request of any party interested, or of the court, the Commissioner and the examiners may be examined under oath, in explanation of the principles of the machine or other thing for which a patent is demanded.

[TO BE CONTINUED.]

FOUND.—A fine, hot, sulphur spring at the head of Panoche Valley in Fresno county. Also, another grove of big trees near this head-waters of King's river, in the same county, which grove is said to be bigger than any other now known. Also, some reasons for supposing that the Indians are contemplating evil deeds in this same district.

ONE MORE.—A tin mine, twenty-five feet in width, is reported to have been discovered in Bainbridge District, San Diego County, which is said to be the rich one of the Coast.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send you but worthy men.

Traveling Agents.

WM. H. MURRAY—Montana, and Utah.
S. H. HARRING—California.
J. M. WOLF—Oregon.
L. P. McCARTY—California.
L. MISEN—Nevada, and Colorado.

Resident Agents.

CENTREVILLE, Alameda Co., Cal.—L. G. Yates, OAKLAND—W. H. Hardy.

HUDSON & MENET, 41 Park Row, New York.
NEW YORK—H. D. Dumont, 73 and 75 Fulton street.
A. C. KEO, City Soliciting and Collecting Agent.

New Incorporations.

The following have filed certificates with the County Clerk, San Francisco:

TWENTY-SIXTH STREET AND ARMY R. R.—Aug. 22. Directors: J. L. Blalock, (President), C. D. Carter, (Vice-President), J. S. Luty, (Treasurer), C. S. Cousins, (Secretary), S. L. Miller, R. B. Fordham, J. Regeburger, J. C. Collins.

SOUTHERN PACIFIC CONS. M. Co. Kern County.—Aug. 26. Capital Stock, \$800,000, in 16,000 shares. Trustees: A. DeLand, H. W. Byngdon, A. Staples, F. R. Shattuck, F. G. Smith, Wm. F. King and J. S. Buller.

The following have been recorded in the Secretary of State's office, Sacramento:

MASONIC HALL ASSOCIATION. Petaluma.—Aug. 25. Capital Stock, \$30,000 in 300 shares. Trustees: J. W. Bowles, H. F. Fairbanks, A. McGuire, A. J. Pierce, and A. J. Schroyer.

SANTA ROSA BANK.—Aug. 31. Capital Stock, \$100,000, in 1,000 shares. Trustees: David Burris, E. T. Farmer, Charles G. Amer, A. Thomas, Thomas J. White. Principal place of business, Santa Rosa, Sonoma County.
HARTFORD GRAVEL M. Co. Nevada County. Capital Stock, \$160,000 in 1,600 shares. Trustees: George Paul, Henry Paul and Chas. Trueman.

NAPA CITY WATER CO.—Sept. 2. Capital Stock, \$250,000 in 2,500 shares. Trustees: A. Chasol, H. Potter and D. Barstow.

NEW YORK G. AND S. M. Co. Ematsville.—Sept. 30. Capital Stock, \$30,000 in 300 shares. Trustees: J. B. Stone, L. Brooks and H. McCaffrey.

PETALUMA SAVING BANK.—Sept. 7th. Capital Stock, \$100,000 in 1,000 shares. Trustees: J. M. Bowles, B. F. Tuttle, F. F. Maynard, J. A. Harding, T. H. Crane, A. P. Whitney, W. Davis, H. T. Fairbanks and A. P. Overton.

Meetings, Elections, Etc.

COLUMBIA RIVER MANUFACTURING CO.—Aug. 27. Trustees: J. B. Knapp, (President and General Agent), N. W. Spaulding, (Vice-President), S. W. Backus, (Secretary and Agent in San Francisco), D. W. Grant, (Treasurer), and L. F. Baker.

PRACTICAL FAITH.—The San Joaquin Republican says that the second well at the Stockton waterworks has reached a depth of 207 feet, and at that depth a layer or stratum of gravel is struck, which much resembles the gravel of our gold-paying mountain creeks. Quartz and black sand are abundant, and a yellow, light substance, resembling gold in every thing except weight, is found quite plentiful. It is probably mica, but several old miners talk of staking off claims and sinking a shaft, preparatory to drifting.

Farming and Gardening.

COMMUNICATIONS for this department are solicited from all parts of the Pacific States and Territories.

Cranberry Culture for California.

Large quantities of cranberries are imported into California from the Eastern States and Oregon. Probably not less than six or eight hundred thousand dollars leave the State every year for this useful and healthful berry; and yet with the single exception of the little experimental patch of upland berries, noticed by us a week or two since as being cultivated by Mr. Marshall, of Grass Valley, we do not know of a single cranberry bed, large or small, in the State. Some three years since, an enterprise of this nature was talked of at San Rafael; but we have not learned whether or not it was ever carried out. Mr. Hill of Grass Valley, and, if we are not mistaken, Mr. Poiar, of the same place, each set out a cranberry patch near the bed of Wolf Creek, in that town, a few years since; but the next high water washed them all away.

Amid the multitudinous variety of fruit display, the past week at the Pavilion, in this city, we did not see a single sample of this useful berry; and yet it is very easily cultivated, one of the surest crops which can be raised, and one that pays six or eight times more profit per acre than wheat. Moreover it is not a perishable fruit, as in the case with a large majority of that which we do raise, and it always commands a ready sale at a large profit.

There is no reason, so far as our knowledge extends, why we should not only be able to supply our domestic wants, but also export largely to China and the East Indies. The soil best adapted to cranberry culture is swamp land, and surely we have enough of that in California, reckoning our tule lands as such, which, without doubt, when reclaimed, so as to be under control for flowing, would make the finest cranberry land in the world. Many fortunes have been made in the business at the East, and the more the berry is cultivated, the greater appears the demand for it.

The cranberry might and should be sold for half its present price, and still form one of the most profitable crops which can be raised. A reduction of one half in its price would more than double its sale. It is a cultivation which ought to be encouraged for sanitary reasons; as it is one of the most healthy fruits that can be eaten. In this respect it is fully equal with the tomato. In the use of its expressed juice, a decided advantage is claimed for it; for unlike the tomato, it is capable of being made to produce not only a very pleasant, but also a very healthy beverage something of the nature of wine, useful both internally and for external application—particularly for persons afflicted with scrofula. The wonderful effects of this berry in cases of erysipelas, are now pretty generally known and acknowledged.

Upland Cranberries.

We have intimated that the cranberry especially delights in a low, swampy soil. This is so; but still it takes kindly to upland, as well—at least one of the three varieties which are known to cultivators does so. Experience seems to show that there is no reason why the cranberry (the "bell" variety) may not be grown in our gardens generally, and as easily as the strawberry. For such culture a moist, but not clayey soil, is no doubt best; but almost any ordinary farming land can be made to produce them. They do not require a rich soil, although a covering of an inch or two of peat or swamp muck, and that again covered with sand—after the plants have been set, is no doubt advantageous.

Cranberries are raised in Russia on high, rocky land, too poor for ordinary farm culture. Mr. Downing recommends them for garden culture, especially for ladies, who he thinks ought to also cultivate them as ornamental plants, for the beauty of their foliage, delicate flowers and rich clusters of crimson fruit. Cole in his Fruit Book says: "Where a gravelly knoll

had been reduced for a road, we saw excellent cranberries, of spontaneous production, on dry, hard and poor soil. On another spot we saw fine fruit by the road side, on very poor dry hard soil."

Cranberries are successfully grown on ordinary farming lands on Long Island Plains, near New York. Mr. E. F. Richardson, among others, is thus cultivating them, near Brentwood, L. I. The experiment of Mr. Marshall, of Grass Valley, already referred to shows, that they can be cultivated in California. Still, to cultivate cranberries for profit, land should undoubtedly be selected which can be readily overflowed, more especially in order that the weeds may thereby be more easily kept down, and the crawling insects which, in older countries than California, are so sure to attack them, may be more readily exterminated.

By all means we of California should raise our own cranberries, and we shall be happy to communicate any information which may be needed in that direction, for those who may wish to try this culture. Experimental patches should first be tried, rather than extensive undertakings; for experience is needed in everything, before we undertake largely.

Westfall's Improved Potato Digger.

We give herewith an illustration of a new potato digger, for which letters patent were issued in June last to D. B. Westfall, of Lyons, N. Y. The operation of this machine is as follows: The oval mold-board, shown at the bottom and front of the engraving, is caused to enter the ground below the potatoes, which are thus lifted out, the earth being either thrown to one side or passing back and dropping between

the fingers projecting in the rear. As the machine moves forward, guided by handles similar to those of an ordinary plow, a reel, not very distinctly shown in the engraving, but attached to a shaft revolved by the gearing shown in connection with the wheels, rakes or throws the potatoes backward, in such a manner that they are deposited in a row upon the surface. The fingers are placed far enough apart to allow the dirt to pass through them but close enough to retain the potatoes, while they roll down and drop from their extremities. Potatoes may thus be readily and rapidly unearthed and left upon the surface to be picked up at leisure. We take pleasure in recommending this as another important labor-saver in harvesting one of our largest agricultural products. Messrs. Weister & Co., No. 314 Bush street, San Francisco, are agents for the sale of the machine, and will furnish the same to parties buying rights at manufacturer's prices.

FARMERS CAN MAKE THEIR OWN HARNESS.

A writer in the *Southern Farmer* says that he makes all his harness with copper belt rivets. The process is so simple, the work so secure, the time it takes to do it so trifling, and the cost so small, that every farmer ought to provide the necessary tools and quit the harness maker forever. No special training is necessary. Any body who can make a partridge trap or pare his own finger nails can make his plow-gear with rivets. He made a good farm bridle in thirty minutes at a cost of fifty cents all told. He needed a set of buggy harness; the dealer asked \$25; but, with the harness maker's aid on the saddle and traces, he made it during two rainy days at a cost of \$12.50 all told.

CANARY SEED A PROFITABLE CROP.—It is reported that Mr. Bagge, to whom we have alluded as engaged in raising canary seed, has cleared \$70 an acre, this season, from five acres sown with that seed.

The Late Exhibition.

Considering the haste in which the late exhibition was gotten up, and the fact that it was the first display of the kind undertaken here, for many years, it must be pronounced on the whole a decided success, both upon its real merits as a fruit and flower show, and in a pecuniary sense as well to the Institute, under whose auspices it was undertaken, although the latter was in no way a primary consideration. Much practical good will no doubt accrue to the exhibitors from being thus brought together for the comparison of notes and mutual encouragement, the result of which will be more fully shown next season, when the exhibition will undoubtedly be repeated, under circumstances more favorable for a fair display of the agricultural, pomological and horticultural resources of the State.

The Fruit Exhibition.

Meager as it was, for want of time to do better, was nevertheless very creditable and worthy of a more extended notice than we were able to give last week. We shall speak further of it as leisure is found to write out our notes, and space can be afforded in our already over-crowded columns. We will commence with the

Display of Fruit from Marysville.

Mr. T. H. Hutchinson, of the New England Orchard Nurseries, of Marysville, exhibited 150 varieties of grapes, for which he took the first premium. Some of his clusters were very large, in fact, the largest ever exhibited, and the entire display was very creditable as well as interesting. Mr. H. exhibited about 35 varieties of peaches, and as many of pears. Of figs he exhibited 9 varieties. It was late for peaches, but he took the first premium for that fruit, as also for figs.

The New England Orchard was started by G. H. Beach in 1852 or 53, but becoming pecuniarily involved, it passed, in 1859, into the hands of the present owner—Mr. T. H. Hutchinson. The land is a high, dry, alluvial bottom, and appears finely adapted to growing a very superior quality of fruit, in that hot climate. Grapes, especially, which are generally small in that region, grow to a great size and are remarkably fine on this soil. Mr. H. has 30 acres of grapes and about 20 of orchard. His nursery is mostly young, but is said to be very thrifty. He took the first premium on dried fruits. His entire figs—4 varieties, apples, pears, peaches, plums and apricots attracted much attention and were truly very nice indeed.

GRASS BROTHERS, also of Marysville, made a fine display of splendid looking fruit—apples, pears, plums and grapes. These gentlemen have been in business only about five years; but they give promise of much success, if their display of fine and healthful fruit is any indication. Marysville has always had the credit of producing superior peaches and early fruits, and this Exhibition has shown that it is not far behind in other choice sorts as well.

The Sacramento Exhibit.

A. P. Smith, of Sacramento, sent to the fair a large collection of very superior pears in variety—for which he took a first premium. California can beat the world for pears, and it seems that Sacramento has led the other counties for pears this time. Mr. Smith has a large nursery and fine orchards, and we only wonder that he made no other exhibit than pears.

[To be continued.]

"CAMUS" is the name of a nutritious and succulent tuber which grows wild in Montana, and which is also largely cultivated by both Indians and white men. It forms a large portion of the winter food of the Indians, and is also becoming a regular article of food among the whites, many of whom prefer it to the potato. Would it not be well to submit this esculent to careful cultivation and change of locality.

Something New in Horticulture—An Interesting Lesson.

Mr. C. C. Chamberlain, a well known horticulturist, near Brooklyn, Long Island has been experimenting for the past six or eight years in dwarfing fruit trees, and causing them to remain thrifty and bear fruit without any contact whatever with soil. The trees after being started in soil, as usual, as soon as they attain a few inches in height, are transferred to pots or baskets, six inches or a foot in diameter, in which is placed nothing but fine moss and concentrated fertilizers. No further attention is given them except to keep the moss constantly moist. This may be done by dipping the basket daily into a vessel of water, or by applying moisture in any other convenient manner. Finely divided sponges would no doubt answer quite as well if not better than moss. It could be more readily placed about the roots of the plant, while it would hold moisture better, and be more indestructible.

A tree thus cultivated is dwarfed in size, yet comes to maturity and fruits as regularly as though grown to its usual size in the garden or field. Mr. Chamberlain has in his conservatory peaches, figs, nectarines, etc. thus grown, and only from 2½ to 5 ft. high, yet loaded with fruit. The fruit so produced, in fact, seems to ripen more rapidly than when grown in the usual manner. He has peach trees thus cultivated, which have produced fruit for four consecutive years. The fruit is finely flavored, of good size and well colored. Of course concentrated fertilizers are added in solution with the water employed.

Of course there is no practical utility in this mode of cultivating fruit. The only interest which attaches to it is novelty, and its introduction as a new feature in fancy and window gardening. A peach, nectarine or plum tree, three feet high or less, loaded down with luscious fruit, would form a very pretty ornament for a dinner table, and the pleasure of plucking the same fresh from the limb, as one sits at the table, would add vastly to its relish.

There is nothing particularly strange or new in thus growing a plant, without the intervention of soil, provided some other medium is employed for conveying the plant food to the roots, and the proper food is furnished. Plants have been grown in pure sand, and even in pulverized glass—the mineral food being furnished in solution, in the water supplied. Very little of the substance of a plant, as ordinarily cultivated, is derived from the soil—nothing in fact but its ash, and but a portion even of that. The whole of its sustenance, (as when given as above alluded to in pulverized glass,) may be furnished by the water introduced to its roots, and the atmosphere in which its roots as well as its limbs are constantly bathed. The atmospheric or organic, as well as the mineral food of plants is no doubt largely received through their roots as well as through their foliage. Envelope the roots of a land plant in a soil filled with water, so that no air can reach them, and the plant will soon die.

If the fires could be kept away from our tule lands, the solid matter which their annual growth would derive from the atmosphere and water would in a very few years reclaim such land, without the aid of human labor. It is thus, in fact, that our tule lands, as they now stand, have been chiefly formed. If we dry and thoroughly burn the peat or turf of which they are mainly composed, we diminish its bulk by fully 80 per cent. or more. The diminution so effected is the measure of the solid substance derived from the air, while the ash represents the detritus which has been brought down from the mountains.

ANOTHER SILK FACTORY IN CONTEMPLATION.—Negotiations are now pending for the sale of the Vacaville College building to a company who propose converting it from its former use to a place to teach the young idea how to spin—they propose to employ it for a silk factory. The Collegiate Institution is to be removed to Santa Rosa.

A New System of Rose Culture.

Some French and English horticulturists have been experimenting for three or four years on a new system of rose culture, which may be stated briefly, thus: "First, prune out all the old wood; second, shorten the new wood a very little; third, peg the new wood down flat to the earth." The rose is thus allowed to bloom as the raspberry bears—only on the new wood, and that slightly pruned.

As unlike the common way of training the rose as this is, the effect is said to be very fine. The young shoots pegged to the ground produce a greater abundance of bloom, although, perhaps, slightly diminished in size. When a rose stalk stands upright, the stronger upward tendency of the sap has the effect to multiply the roses near the top; while, when trained upon the earth, the sap works more evenly throughout the entire length of the stalk. This is shown both in the bloom and in the multitudinous upward shooting of stems from the main stalk. The effect of this new mode of training would no doubt be very fine in covering sloping banks and mounds, and also in the more rapid production of small roses for bouquets, etc. Its novelty will no doubt commend it to all amateurs who have time and inclination to experiment.

No plant requires closer pruning than the rose, and the finest blooms are always found upon the stalks which shoot forth from the root, showing the importance of a severe cutting away of the old wood. The bush should also be trimmed so as to open its branches as much as possible, for it likes the sun. The more sunlight the rose receives, the more rapid its growth and the more numerous and beautiful its flowers. For this reason, we may reasonably presume, that low or ground pruning might be very advantageous to it in the vicinity of San Francisco, and wherever else on this Coast the cold westerly sea winds reach.

The Ailanthus Silk Worm.

Much is being said and written at the present time, both in California and in the Atlantic States, with regard to a species of the silk worm, known as the "Ailanthus Silk Worm," by some represented to be the *Attacus Cynthia*, by others the *Bombyx Cynthia* of the hotanists. A late writer in the *Bulletin*, urging the introduction of this insect into California, says:—

Many experiments have been made with this species during the past season in various parts of America with perfect success; particularly in New York and Staten Island, at which latter place, the worms were placed on a tree, in a private garden, passing all through the rain storms and heat, etc., growing to an immense size and spinning their cocoons on the tree, being an object of great curiosity and attraction. They require no care or attention but a simple covering of muslin over the tree to keep off the birds, and few minutes of time each day, to cleanse the covering from the refuse matter. Their easy culture has thus been fully demonstrated.

In connection with the above it may be well to peruse the following from the June number of the American *Entomologist* and *Botanist*, which is copied and specially endorsed by the *Journal of the Farm*, published in Philadelphia, near where the experiments alluded to by the *Bulletin* correspondent were made. We copy as follows:—

"The cocoons found on Ailanthus in Brooklyn, the worms of which were very numerous last season, so that the "Tree of Heaven," though long exempt, has at last become the food of worms, are actually those of the Ailanthus Silk-worm (*Attacus Cynthia*, Hubn.) It was introduced into this country in 1861, and has been fully experimented with since then. Dr. Morris, of Baltimore, published elaborate papers on the culture of this worm in the Patent Office Reports for 1861-2, and five years ago we made extensive experiments with it,

and then there stated our belief that its cocoon was of no more value than that of some of our native silk-worms. The Ailanthus worm has since become wild, and is rapidly increasing around the cities of Baltimore, Philadelphia, Chicago, and, as it now appears, around Brooklyn. And yet a certain Prof. J. Q. A. Warren, who seems to have a sort of sermomania, is now traveling over the country, and delivering, with an appearance of originality, to the scientific academies of our principal cities, the same lecture which he delivered some time since, before your Farmers' Institute Club—totally ignorant what has been done in past years, and soliciting government aid in the introduction of this worm. If this should meet the Professor's eye, he will know that the Ailanthus worm takes kindly to our climate without legislative aid. We would also suggest to him that he had better first post himself as to what has been done abroad by such men as Guerin Meneville, and would ask him whether he thinks it worth while to preach so loudly, after the French have tested the insect so thoroughly without any good result?"

The *Journal of the Farm*, which publishes the above extract in its issue of the 1st of August, adds the following:—

We may further state that the firm of Vilhormin & Co. of Paris, in 1862 sent an order to this city (Philadelphia) for a large quantity of seeds of the Ailanthus tree, in order to raise food for the Silk-worm, so that we had ample evidence that a fair trial had been made of its value in an economical point of view.

THE NOVELTY FANNING MILL AND GRAIN SEPARATOR.
The Novelty Mill.

The number of grain separators which has been patented is legion. The importance of having a really good machine, which will effectually separate the different kinds of seed, is so great, and the prospective reward of the man who can get up such a device is so promising, that the candidates for the patronage of the farmer are many in number.

The machine, a cut of which we present to our agricultural readers to-day, is not only a grain separator, but it also has the essential qualities of a good fanning mill. It can be used, therefore, for chaffing the grain, and then as a separator. It is highly recommended for both purposes by parties who have used it. In separating, the grain is fed into the hopper, shown at the top of the machine, and thence falls into a feed-wheel, which distributes it equally over the whole width of the sieve. The motion of the mill regulates the amount of feed, so that this shall always correspond with the rapidity of its action. The sieves have a longitudinal motion, not one from side to side.

The mill gives two distinct qualities of wheat, if desired. It separates out the large, plump and perfect kernels for seed wheat, while it deposits the cut or shrunk ones, which will not germinate, in another compartment. It puts, in the proper and distinct receptacles, the barley and oats, the cheat, and the mustard and other fine seed. There are wind-boards in the mill so arranged as to direct the wind to any de-

sired point, giving a good clean product. One man can easily do all the work required with this apparatus.

It is believed that this mill is peculiarly adapted to the special conditions of this Coast, and as such it is offered to our farmers. We are informed that it has been tried here with the greatest success. Mr. R. Stone, 422 Battery street, S. F., is the person to apply to for further desired information.

What I Know of Farming—No. 34.

Sheep and Wool-Growing.

Ours is eminently an agricultural country. We produce most of our food and export much more than we import of both Grain and Meat. Of Cotton, we grow some Three Millions of bales annually, whereof we export fully two-thirds. But of this we re-import a portion in the shape of Fabrics and of thread, and yet, while we are largely clothed in Woolens, and extensive sections of our country are admirably adapted to the rearing of Sheep and the production of Wool, we not only import a considerable share of the Woolens in which we are clad, but we also import a considerable proportion of the Wool wherefrom we manufacture the Woolens fabricated on our own soil. In other words: while we are a nation of farmers and herdsmen, we fail to grow so much wool as is needed to shield us against the caprices and inclemencies of our diverse but generally fitful climates.

sted with bushes and briars, which seems to flourish by cutting, if he finds time to cut them, and which the ruggedness of his soil precludes his exterminating by the plow. In every such case, Sheep are his natural allies—his unpaid police—his vigilant and thorough going assistants. Give them an even start in Spring with the bushes and briars; let their number be sufficient; and they are very sure to come out ahead in the Fall.

IV. The fourth reason refers to the advantage of sheep growing in furnishing farmers in the country with fresh meat.—[Eos. Press]

V. Now, I do not insist that every farmer should grow Sheep; for I know that many are so situated that they cannot. In stony regions, where walls are very generally relied on for fences, I am aware that Sheep are with difficulty kept within bounds; and this is a serious objection. In the neighborhood of cities and large villages, where Fresh Meat may be bought from day to day, one valid reason for keeping them has no application; yet I hold that twice as many of our farmers as now have flocks ought to have them, and would thereby increase their profits as well as the comfort of their families. * * *

As yet, our farmers have not generally realized that enhancement of the value of Mutton, whereby their British rivals have profited so largely. Their fathers began to breed Sheep when a fleece sold for much more than a carcass, and when fineness and abundance of Wool were the main consideration. But such is no longer the fact, at least in the Eastern and Middle States. To-day, large and long-wooled Sheep of the Cotswold and similar breeds are grown with far greater profit in this section than the fine-wooled Merino and Saxony, except where choice specimens of the latter can be sold at high prices for removal to Texas and the Far West. The growing of these high priced animals must necessarily be confined to few hands. The average farmer cannot expect to sell bucks at \$1,000, or even at \$5,000, as some have been sold, or at least reported. He must calculate that his Sheep are to be sold, when sold at all, at prices ranging from \$10 down to \$5, if not lower, so that mechanics and merchants may buy and eat them without absolute ruin; and he must realize that 100 pounds of Mutton at 10 cents, with 6 pounds of Wool at 30 cents, amount to more than 60 pounds of Mutton at 8 cents, and 10 pounds of Wool at 60 cents. Farmers who grow Sheep for Mutton in this vicinity, and manage to have lambs of good size for sale in June or July, assure me that their profit on these is greater than on almost anything else their farms will produce; and they say what they know.

The satisfactory experience of this class may be repeated to-day in the neighborhood of any considerable city in the Union. Sheep-growing is no experiment, it is an assured and gratifying success with all who understand and are fitly placed for its prosecution. I would gladly incite the farmers of our country to comprehend this fact, and act so as to profit by it.—Horace Greeley.

Notices to Correspondents.

RECEIVED.—We have received, and shall notice at the earliest opportunity, communications from L. P. Mc., on Plumas Co.; MINER, on Wyoming Territory Coal Mines; Almarin B. Paul, on the White Mountain mines; CARSON, on the Leviathan mine; and TIMOTHY, on the Burro mines.

A BOOK LONG NEEDED.—We have before us the "Engineers' Index to the London Journal of Gas Lighting," compiled by Mr. James R. Smedberg, Consulting Engineer, San Francisco Gas Co. Full sets of this Journal are very rare and expensive, there being, we believe, but three in the whole country. Hence, the value of the Index, as such, is limited. But it serves the useful purpose of showing the scope of "The Synopsis of British Gas Lighting," projected by Mr. Smedberg, about years ago, at the instance of the great gas companies, and now ready for the printer. This work will be a complete and compendious record of Gas-making during 20 years, embracing 900 monographs on the various processes, and 1200 patents. It will be sold only by subscription, at \$15 per copy. As a valuable contribution to our technical literature, and an additional evidence of the varied industry of the Pacific Coast, we wish it every success.

LEAD POISONING THROUGH GALVANIC ACTION.—Mr. P. Casamajor, of New York, finds that lead is often present in tin-lined copper boilers, and accounts for its presence by the voltaic action resulting from the contact of the lead in the lining, or in the connecting pipes, with the copper of the boiler. To prove this he took pieces of lead and copper and put them in contact in two flasks which he left in the dark at the temperatures of 75° Fah. and 150° Fah., for forty hours. In both instances the surface of the lead was corroded, and that metal was found to be in solution in the water. Similar experiments with lead and tin were followed by no such result. The lead was at first slightly affected by the weak current produced, but soon became coated with oxide, and the combination was then inactive. The experiments are detailed in the *American Chemist*.

Railroads.

There is no subject of greater importance to the whole of our western territory, at present, than that of railroads. We must have these running throughout the length and breadth of our country, or we cannot hope to progress with any satisfactory degree of rapidity. So important has the subject been deemed, that, of late years, railroad companies have obtained enormous grants, and the country has obtained a number of railroads. But a reaction is now setting in and protests against such grants are being raised in many quarters.

Still we must have more roads and we must make it a good thing for somebody to build the roads. But it is not necessary to have those roads so tremendously expensive. Through the little Festiniog Railroad in Wales, public attention has of late been attracted to the subject of narrow-gauge roads. In the Press of April 4th, 1868, a description of this road was given, and we have since spoken of it from time to time. The late examination of the railway by Commissioners of the Russian and (English) Indian governments has caused quite an excitement on the subject.

There are propositions for building quite a number of railroads through the different sections of the West. The most important are the Northern and Southern Pacific roads. Then smaller ones are projected in the several States and Territories:—San Bernardino people talk of a road to Wilmington, Austin has long desired one from the C. P. R. R., White Pine seems to be bound for a line, which may be extended so as to benefit the southwestern part of Utah, and, in Colorado, Boulder, Central City and Georgetown are having railway surveys undertaken.

Now, on the shorter routes, the matter of the narrow-gauge has readily suggested itself. But from the results shown to be possible by the Festiniog road, it might be thought that the system could be extended also to longer lines. As to the capability of the road for traffic, Norway, and especially Sweden, have extended narrow-gauge systems; and eminent English engineers have declared that "on a 2 ft. 6 in. gauge and with the Fairlie engine (the double-bogie used on the Festiniog road) they would undertake to work the heaviest traffic in the world!" Add to this assertion, made after deliberate examination by men with a reputation to lose, the fact that the cost of such a road is less than one-half that of our common roads, and that the relative expense decreases with the increase of natural obstacles, and we have said sufficient to warrant a thorough examination of the system for our coast.

We may be permitted to glance briefly at the present railroad status. The different surveying parties of the Northern Pacific seem to be briskly pushing work. The engineers are, we believe, Maj. Flint, Chief, Gen. Tilton, next in rank, and De Lacey, Fife, Smith, Maxwell and Kidder, Division Engineers. Maxwell is reported as surveying from Seattle east through Snowquallmie Pass to Priest's Rapids, on the Columbia river; Kidder, from Seattle to Olympia; Fife, from Olympia to Vancouver. De Lacey has surveyed the Snake and Salmon rivers to their junction with the Columbia at Lewiston, and now has a different route hack. Smith is surveying the Columbia river.

The Portland and Astoria road is being surveyed.

The Oregon and California road is being pushed on. Track-laying was commenced on the 29th ult., and it was expected that cars would be running to Salem by the 12th inst. The citizens of Albany, Linn county, are taking measures to raise a subsidy, as, according to the report, the surveyed line runs some distance east of their town, and they must pay to have the road pass through the place. The southern counties of Oregon are still excited as to whether they will have the road. We see that the Humboldt and Oregon Branch R. R. Co. was incorporated at Jacksonville on Aug. 29th. Object, "to build a railroad from the North Bend of the Humboldt River, in Nevada, to connect with the Oregon and California R. R., at some point in Jackson county, Oregon."

The connecting road, the California and Oregon, has been working hard until this week, when a large force was transferred to the San Joaquin Valley road. On the 2d, trains were running seven miles above Chico, and on the 3d, the grading was finished sixteen miles above Chico. According to Yreka papers, the Pitt River route has been abandoned. The McCloud

River route is being surveyed now. This runs along the McCloud river to Squaw Valley, through the Elk Flat, along the eastern side of Shasta, to Butte Creek valley, and thence to the State line, near Little Klamath lake. There is considerable doubt expressed as to the feasibility of this line. The Sacramento Valley route is also being surveyed.

The California Pacific has built its depot at Marysville in connection with that of the Oroville road, and the first freight was discharged at this depot on the 29th ult. It is proposed to change the gauge of the Oroville line to conform to the California Pacific, so that through trains may be run. Surveyors are reported running lines to Red Bluff and the Shasta Courier thinks the extension of the Vallejo route to Red Bluff is now a certainty, and that to Shasta a strong possibility.

The Sonoma Railroad, after its long rest, has been roused to activity by San Francisco parties, among whom the name of Peter Donahue is most prominent. McCauley transferred the road on Aug. 5th. On the 16th, Robert L. Harris, Chief Engineer, arrived at Petaluma, and everything has since been brisk. The road has been graded from Petaluma to Santa Rosa, and it is hoped that this part will be finished by the middle of October. On Aug. 30th, the "first spike" was driven. The steamers *Sacramento* and *Wilson G. Hunt* are to be used to connect the road with this city.

Work has been commenced in earnest on the San Joaquin Valley R. R. Fifty men are at work on the bridge across the Stanislaus, and on Monday a strong force was transferred from the California and Oregon road to grade between the Stanislaus and Tuolumne rivers. The road, says the *Tuolumne City News*, will cross the Tuolumne at the mouth of Dry Creek, and the Merced come four and a half miles below McSwain's Ferry. We hear that cars will be running to Tuolumne City within two months.

The proposed road from Santa Clara to deep water beyond Alviso, with, perhaps, a future extension to Saratoga, or the foot of the Coast Range beyond, has met with a dampener. The proposed subsidy of \$150,000, to be given by the county, was submitted to popular vote and defeated, but by a very small majority.—The Stockton and Copperopolis road is entirely quiescent.

The assessment of the Los Angeles and San Pedro road (which was assessed in the sum of \$122,640), has again brought the affairs of this company prominently before the public, the Board of Supervisors declaring the assessment "improper." There is some talk of extending the road to San Bernardino, and the directors are reported as willing to build this extension, if the people will yield all claims to the \$225,000 in city and county bonds now in litigation. San Bernardino proposes also a road to Wilmington via Anaheim.

The Southern Pacific is announced as about to begin work at the western end within two months, but what foundation of truth there is for the announcement, we know not. The road still holds its lands although it failed of its subsidy at the last session of Congress. We hope the report is true. The interests of the Coast will be materially advanced by its speedy completion.

The completion of the Kansas Pacific, on Aug. 15th, deserves a long notice, which we would gladly give had we the space. But we have already noticed the event, and the manner in which the last 10½ miles was laid, in 10 hours! This, the greatest enterprise since the Pacific roads were built, will prove a most important one. Probably an extension southwards will be made at no distant day. The Chief Engineer of the road is Col. W. H. Greenwood, and the Construction Engineer, Gen. W. J. Palmer. The excursion party from St. Louis arrived at Denver on the 3d inst.

When we commenced, we intended speaking more fully of the talked-of branch line to Austin and that to White Pine (which, we are inclined to think, ought to start from Palisade station and run so as to tap Mineral Hill and Eureka Districts). We wished to notice the roads in Colorado from Denver to Central City and Georgetown, and to Boulder, a company for which last, with Gov. Evans as President, has been organized. But space fails us this time.

Our present number is full of illustrations, and we are obliged to put one, and an important one, of Lynde's Safety Appliances for Steam Boilers, on the tenth page, in order not to trespass on our readers' matter.

The Exhibition Awards.

In the awards for fruit which were given in our last issue, that to H. T. Hutchinson, should have read, "awarded \$40 for the best exhibit of Peaches," instead of \$10, as given.

In addition to the list as already given, West Bros. of Stockton, were awarded \$30, as special premium for exhibit of foreign grapes.

CLASS THREE—VEGETABLES.

D. L. Perkins, Sherman Island, best single variety of early potatoes (Early Rose) \$3 00.
 D. L. Perkins, best exhibit sweet-corn, \$3 00.
 D. L. Perkins, best exhibit watermelons, \$3 00.
 D. L. Perkins, best exhibit beets, \$3 00.
 W. H. Marsh, Napa, best exhibit of squash (two varieties) \$3 00.
 W. H. Marsh, for fine specimens of growing corn, \$3 00.

CLASS FOUR—FLOWERS.

E. L. Reimer, San Francisco, best and largest collection of plants for lawns, gardens and conservatories, \$100.
 T. Appleby, San Francisco best collection of evergreen trees and shrubs, \$50.
 Edward D. Moor, San Francisco, best collection of decorative plants of newest varieties, \$50.
 J. Hutchinson, Oakland, best collection of climbing plants, \$25.
 T. Appleby, San Francisco, best collection and variety of bedding plants of verbenas, dranthies, petunias, and pansies, (twelve of each) \$25.
 Charles Schuman, gardener of R. B. Woodward, best collection of twelve colored leaf plants, \$25.
 J. Hutchinson, Oakland, best exhibit of cut flowers, \$25.

W. Meyer & Co. San Francisco, best exhibit of round or flat bouquets, \$25.
 Mr. Miller, San Francisco, best design illustrating principles of landscape gardening, \$30.
 Awards to non-professional growers.
 E. A. Upton, best display of dahlias, fuschias, Petunias and dranthies, elegant flower stand.
 E. E. Moore, San Francisco, best collection of gladioli, a diploma.

General Kirkham, donation of century plant, award, book—"Wonders of the Sea."
 E. L. Reimer, San Francisco, beautiful arrangement and display of plants, a diploma.
 T. Appleby, San Francisco, collection of holly-hocks, roses, and dried and ornamental grasses tastefully displayed, a diploma.

W. Meyer & Co., baskets of flowers, a diploma.
 Kelsey's Nursery, cultivated by G. Gustavson, Oakland, collection of deciduous forest trees and miscellaneous plants, a diploma.
 J. O'Hara, San Francisco, general collection of ornamental trees and shrubs, a diploma.
 Charles Schuman, gardener to R. B. Woodward, grandest display of tropical plants, trees, etc., a diploma.

Mr. Allen, San Francisco, meritorious display of flowering plants, a diploma.
 J. Hutchinson, Oakland, splendid collection of greenhouse plants, a diploma.
 Mrs. Tyler Curtis, rare Japanese and hothouse plants—award, Robinson's Alpine Flowers.

CLASS FIVE—CEREALS.

W. Hunt, Oakland, best collection of oats, \$5.
 W. L. Perkins, best specimen of corn in the ear, \$5.
 D. L. Perkins, honorable mention for very superior wheat.

CLASS SIX—MISCELLANEOUS.

California Silk Culture Company, best specimen of silk, (raw) a diploma.
 W. H. Baxter, best specimen of unperforated cocoons, \$20.
 D. L. Perkins, Sherman Island, best specimen of flax, \$10.
 J. S. Finch, best specimen of ramie plant and fibre, \$15.
 J. H. Schnell, El Dorado, best specimen of tea plants, \$20.
 J. H. Purdy, best specimen of sorghum sugar, \$5.
 Isaac Bird, San Jose, best specimen of hops, \$5.
 J. H. Schnell, mountain rice, goma plant and paper plant, a diploma.
 D. L. Perkins, 138 varieties of seeds, silver medal.

W. F. Swazy, San Francisco, California bonzet, a diploma.
 W. J. Laveny & Co., very fine sample of starch, a diploma.

Bowen Bros., San Francisco, mountain honey and pop corn, a diploma.

REFINING WINES.—We are told that experiments for refining and giving age to brandies, wines and spirits, by Mr. John L. Constable's process, have been very successful. Brandies and muddy and acid wines have been operated on and have become clear and ripe, and have, moreover, remained in the best condition thereafter, although subjected to severe tests of heat and cold. In 10 to 24 hours, the wine treated ripens as much as it does otherwise in years. A patent for the process is now pending.

The mining town of Portwiae, Sierra County, was almost entirely destroyed by fire on the 1st inst. Twenty-two buildings were burnt down.

Utah.

The people of Utah commenced, so to speak, at the opposite end of the string to that at which the inhabitants of any other place on our coast began. Their first step was to develop the agricultural capacities of their section, their last to investigate their mineral resources; our first, on the contrary, was to open the mines, and then attention was afterwards paid to farming. Which method is the better, is, perhaps, open to discussion, but there are many reasons which point to theirs as the safer and more sure, although, possibly, the slower.

When we look at what the Mormons have accomplished, we are obliged to admire and wonder. Twenty-three years ago a band of about even-score entered the territory. Others came later, but brought nothing save a little food, a small amount of clothing and some agricultural implements. Now there are about 150,000 people there, who are almost entirely independent of the outside world, notwithstanding the many natural difficulties they have had to contend with. The property value, according to the Territorial Auditor's Report for 1868, was \$10,533,873 and the tax assessed for that year amounted to \$52,669.

When the pioneers arrived at Salt Lake, the sandy soil, producing nothing but the sage brush, must have been the picture of desolation. But they gave themselves no time for murmuring, and the very day of their arrival, we are told, they commenced plowing and planting! In 1867, according to reports sent us, this people had some 130,000 acres under cultivation. Of these, there were planted about

80,000	acres in	cereals,
2,400	"	sorghum,
6,800	"	root crops,
300	"	cotton,
500	"	apple orchards,
1,000	"	peach trees,
75	"	grapes,
1.5	"	currants and
30,000	"	were meadow land.

About 94,000 acres had to be irrigated, and the cost, during the year, for canals, dams, cleaning ditches, etc., amounted to \$274,000. The accounts for 1866 show 124,798 acres irrigated, at a total expense of \$303,863. But the great curse of the farmer has been the grasshopper. Coming in resistless numbers, these animals devour everything before them, and strip the country most thoroughly. Luckily, it is often possible to replant and harvest after they have passed over the land. The farmers have had a very hard time this year from this cause.

In home manufactures the Mormons have made wonderful progress. They have manufactured leather and farming tools from the beginning. They built grist and saw-mills at a very early period. In order to keep up the necessary supply of clothes, they used at first the old-time spinning wheel, hand card and loom. In 1849, they imported a carding machine and put it in operation. Then other machines were purchased, and before long they could make a good quality of cloth. The first woolen mill (the "Deseret") was built in 1864, and at least four others are now running, while we hear of the construction of mills at Big Spring (Tooele county), Provo (Utah county), Brigham City (Box Elder county) and Beaver City (Beaver county), while others are said to be in the course of erection. We have received samples of goods from two of the mills, which are of very creditable finish. It is estimated that the mills now running and being built will be capable of turning out cloth of the value of \$700,000 annually.

The people are continually adding to the number of their home industries. One of the most important is the silk business. It would appear that the mulberry can be grown and the silk-worm reared with success in the territory. We have received cocoons from President Young's establishment and understand that there will be,

this year, about two millions of cocoons in Utah. The production of cotton, also, is exciting considerable interest, and there are numerous other productions which may in time grow to powerful interests.

The Mormons have evidently a large number of skilful mechanics. Their factories and mills attest to this. Their Tabernacle at Salt Lake City is a wonderful piece of architecture. They are now building a large organ, the third largest in the United States and the largest ever built in our country, every part of which, except the pipes, is being constructed of Utah material by Utah mechanics.

The matter of education has not been neglected. We find, by the Annual Report for 1869, that there are, in the Territory, 243 common schools, with 342 teachers and an average daily attendance of 10,618 scholars. This does not include the schools in Pinte and Sevier counties which were "abandoned in consequence of Indian hostilities." We find in the catalogue of

present almost entirely undeveloped, although we believe she will, at no distant day be one of our largest producers.

The Earle Steam Pump.

There is a steam pump which has taken the highest premiums at the Maryland Institute in Baltimore, the American Institute in New York the Mass. Mechanics' Institute in Boston, and a Certificate of Superiority at the Paris Exposition, to a great extent on the ground of its being the simplest pump made.

This, called the Earle pump, has one single piston steam valve, working in a horizontal direction and having the valve-cylinder jacketed, thus preventing the sticking of the valve which is often a great trouble. It is operated by steam taken from the main cylinder, after it has completed its work and is ready to be exhausted, thus economizing steam to a great extent. The pump is made of the smallest possible number of parts, the main object

EARLE PATENT STEAM PUMP.

the University of Deseret for the academic year, 1869-70, the names of 14 officers of the Faculty, and a total number of 546 scholars,—307 males and 239 females.

As to the character of the people, all accounts from persons who have visited the Territory agree in representing the Mormons as most industrious, earnest, orderly and frugal. They are kindly disposed one towards another and ever willing to help their neighbors. They are imbued with the co-operative spirit and are determined to foster and promote home industries to the highest degree. They are among the best of citizens and are, without question, devotedly loyal to what they consider the right.

In leaving the mineral resources to be apokee of last to these few brief remarks on the Territory, we have but followed the order of events. There is apparently no reason to doubt, however, but that Utah is rich in this respect. Coal is found in various localities, as in Summit and Saupete counties, of a good quality. Iron also is known to exist in large amounts. As early as 1832 smelting works were built in Iron county, although subsequently abandoned on account of want of proper fuel. In Summit county there is also considerable ore. The Union Iron Co. was in successful operation with two furnaces in January of last year, and it may be remarked, the "last spike" of the Utah Central R. R. was of Utah iron. Silver, lead and copper are found in various localities. Last week, we heard of a new and rich discovery in Rush Valley, some forty or forty-five miles west of Salt Lake City. But with regard to metals, Utah is

being the greatest simplicity consistent with great efficiency. Every part is easy of access, the joints are all ground, and both pistons have spring rings. There are different kinds made for various purposes, the construction of the water cylinder rendering it easy to change the valves, thereby fitting them for either hot or cold, thick or thin liquids, oils or acids. The manufacturers recommend it highly for mining as well as for other purposes. To show its power they give examples, among others, of a No. 7 pump drawing 16,000 gallons of water hourly one thousand feet, with an elevation of twenty-five feet, and forcing it up the hill to the top of the buildings, and doing this with steam brought from boilers situated 575 feet from the pump; also of a No. 6 pump forcing 4,000 gallons of oil per hour through two miles of tubing and over two summits, each 300 feet high, and doing this with a small 8 horse portable boiler.

The pump is claimed to move without noise or jar and as smoothly at a high as at a low speed. Furthermore it is sold at a low price. There are other points claimed which we have hardly the space to speak of here, but which may be learned fully by applying to Baker & Hamilton, No. 13 Front Street, S. F.

STATE GEOLOGICAL SURVEY.—Prof. Whitney leaves for the east, this week or next, in order to superintend the publication of the books of the survey, the printing of which was stopped by the failure of the Legislature before the last to donate funds for the continuance of the work. Meanwhile work will be continued by parties in Lake county and along the courses of the ancient river beds.

A Full List of Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS TO DEWEY & CO., U. S. AND FOREIGN PATENT AGENTS, AND PUBLISHERS OF THE SCIENTIFIC PRESS.]

FOR THE WEEK ENDING AUGUST 30TH.

GANO-PLOW.—Abram Ellison, Marysville, Cal.

MACHINE FOR FORMING SHEET-METAL MOLDINGS.—Henry G. Fisko, San Francisco, Cal.

CARRIAGE.—John R. Hiller, Woodland, Cal., assignor to himself and Clark Elliott, same place.

CATTLE-STANCHION.—John D. Scott, Alviso, Cal.

PUMP.—Martin Wilcox, Sacramento, Cal.

WASHING MACHINE.—Lowell L. Peck, Portland, Oregon.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO., in the shortest time possible (by telegraph or otherwise), at the lowest rates. All patent business for Pacific coast inventors transacted with greater security and in much less time than by any other agency.

EXCEEDINGLY INGENIOUS.

—We were shown, a day or two ago, a most ingenious device. It is a carpet stretcher but has, in addition, a hammer, operated by a spring, by which the carpet while held by the stretcher, is tacked in place. It is exceedingly simple and enables one person to lay, stretch and tack a carpet while standing upright without other assistance. The merits of this device are palpable at first sight. Another most simple and effective contrivance—for hitching horses—has likewise been shown us by the same parties. This consists merely of a hopple for the fore-legs of the animal, which is connected by a strap with the strap of the bridle under the jaw. This does away with hitching posts and weights and renders a runaway impossible. It is bound to come into favor. E. A. Friend & Co., 601 California street, have both the these devices, which are well worth trouble of going to see.

The Agricultural Fairs.

The Agricultural Fairs in various parts of the State have now fairly commenced, having been opened by the Pomological and Horticultural Fair in this city, which closed on Saturday last.

The Northern District Fair, at Marysville, closed its session yesterday, as also did the Contra Costa County Fair at Pacheco. All of these Fairs have been well attended, and have made a highly creditable exhibit.

The State Agricultural Society opens its annual exhibition in the Pavilion at Sacramento, on Monday next, and will continue through the entire week. Great exertions have been made to make the exhibition one which shall be creditable to the State, and it is hoped the attendance will be large. The various railroads and steamer lines, have extended their usual liberality in passenger reductions free freight.

The San Joaquin District Agricultural Fair commences at Stockton Sept. 20th, and will continue five days.

The Sonoma County Fair will commence on the 3d of October, and continue six days.

The Santa Clara County Fair commences October 4th, and continues five days.

The Oregon State Agricultural Fair, will be held at Salem, commencing Oct. 10th and continuing six days.

It is to be hoped our agricultural producers will take a proper interest in the several places and do all they can to make them, one and all, a complete success.

Lynde's Safety Appliances for Boilers.

In this Age of Steam, anything which has gained the reputation of making the use of the steam engine safer or more

steam above a certain pressure, and it is so arranged as to be at all times under the control of the master mechanic, while it cannot be tampered with by others, for it can be locked up or sealed after being set in a different case, as generally used on stationary and marine boilers; and Fig. 3, the locomotive valve without the case. The following is the explanation given us: The valve is held down by the spiral

fall until the spring can overcome the disc, C, when it will suddenly cease blowing. The margin between commencing, and blowing hard enough to actually prevent any more pressure, is, at the will of the person who sets it, from 1 to 5 pounds (or

FIG. 3.

economical has become a matter of importance and interest. Such a device is the safety valve which we illustrate to day, by the use of which, it is said, the two causes—low water and over pressure—assigned for the great majority of boiler explosions, may be avoided. It certainly would appear to approach very near to the ideal of a safety valve, which should discharge all the

and cannot be altered afterwards without detection. Again, it is so constructed that it may be set to open suddenly, blow down rapidly and stop, as some engineers think best, or to open gradually, as most prefer. So much we give as introductory to the description.

The large cut represents a full size locomotive valve; Fig. 2, the same valve

which, the valve A being lifted directly off its seat, more steam will enter the chamber than can pass out between C and D. Of course then the full pressure will be exerted against C, which from its concavity will cause an increased pressure against the spring, overcoming the extra power caused by compression, when the valve will rise and steam is blown off rapidly, causing the pressure to

spring, L, Fig. 3, and guided by the stem, E, below, and guide wings B B, above. A, B and C are a single casting; C being a disc or cover, connected to A by wings, B B. As the steam commences to force the valve open, it first enters the chamber, the roof of which is the disc C, and must pass out between C and D—of course C rises with A—but the space between C and D will not be increased until the lower edge of C reaches the top of D; before

more if desired).

The large cut has portions "broken out" to show the working part. The case, J, is in two pieces or halves, which are held together by the screw-bolts, L L, which also confine the caps, M M; the hole of the back ear of the cap being tapped, into which L screws, so that to remove the case the bolt must be unscrewed; this is prevented by the bar, W, which is fastened, being eyed at one end, by a lock or pin and seal, in the bolt head as shown. W is of hardened steel so it cannot be removed by bending. J is cast iron, while the other parts of the case are of best composition, thus having strength and lightness. The shield, K, prevents wedging the spring or barring the valve through the posts in J. The cut shows the arrangement without the try lever, (as K, in small cuts,) but it is easily applied if wanted, as shown by the dotted lines at the top.

The stationary and marine valves are screwed or flanged as desired to connect them, but the locomotive valve is fitted into the dome-cap (a portion of which, I I, is shown in the cut) and riveted at X X, to hold it in place.

These appliances are working into public favor as they have opportunity to be tested in practice. Unsolicited testimonials have been sent to their proprietor, who is ready to show them or give any desired information. For such or for circulars and agencies apply to J. D. Lynde, 405, N. 8th street, Philadelphia.

SAM. A. LEWIS, Agent.

Pacific Mail Steamship Company.—For
New York, via PANAMA. PRICES GREATLY REDUCED.

Leave wharf corner of First and Brann streets punctu-
ally at 11 o'clock A. M. on the 3d and 15th of each
month (except when either date falls on Sunday, then
on Saturday preceding), for PANAMA, connecting, via
Panama Railroad, with one of the Company's splendid
steamers from ASPENWALL for NEW YORK.
September 17.....MONTANA
Connecting with the Alaska.
All steamers touch at Acapulco; the steamer of the 24

is expected to touch at San Jose de Guatemala; steamer
of the 18th touches at Manzanilla.

For Japan and China.—Steamers leave on the
1st of every month, punctually at noon, for YOKO-
HAMA and HONGKONG, connecting at Yokohama with
the Company's Branch Line for SHANGHAI, via Higo
and Nagasaki.

October 1.—JAPAN, Captain Warsaw.
Apply at the Pacific Mail Steamship Company's office
corner Sacramento and Leidesdorf streets.

One Per Cent. per Month
Allowed on Six Months' Deposits by the CALIFORNIA
BUILDING, LOAN AND SAVINGS BANK, California
street, one door from Sansome.
THOMAS MOONEY, President 6v19-1m

Reading for the Hour.

A Chemical Dance.

Under this heading, the *Moniteur Scientifique* describes the novel manner in which Dr. Hoffman, of Berlin, showed his pupils an experiment with aniline colors. His wife gave a grand ball. In one of the dances a large number of bouquets of artificial flowers, all snow-white, were given to the ladies, and strips of white silk ribbon to the gentlemen. Waltzing down to one end of the room, the couples held the bouquets and ribbons under a fountain of *eau de cologne*. The white flowers suddenly became beautifully red, violet, blue, yellow and green, while the ribbons carried by the gentlemen assumed similar colors. The secret of the change was that the objects had been previously dusted over with the dry powders of variously-prepared aniline colors, and, on becoming moistened by the *eau de cologne* (alcohol), these powders became dissolved and imparted colors to the objects.

The Rival Breech-Loaders.

The Needle Gun.

The Prussian Needle gun is the invention of Mr. Dreyse, who spent over thirty years in trying to construct a perfect breech-loading rifle. The cartridge is inserted at the rear, and the ignition is produced by the intrusion of a needle into the fulminate attached to the cartridge. The barrel, 36 inches long, is rifled with four grooves down to the breech, where is the smooth chamber, a little larger than the bore, for the cartridge. The rear of barrel is conical and is called the mouth-piece. Over this part there is a six-sided cylinder, which holds all the mechanism of the piece. The air-chamber, next to the cylinder, has the needle pipe screwed into its breech. The ball is spherico-conical. The charge of powder is 56 grains; weight of gun, 10. 27 to 11. 3 lbs. The mechanism can be taken apart without screw-driver, etc., and can be easily and safely cleaned. The objections are that there is danger of a weakening of the spiral spring and a possibility that the needle may not be propelled with force enough to pierce the cartridge.

The Chassepot.

This rifle is the invention of M. Chassepot, after studying the Prussian gun. It resembles the needle-gun, but has several improvements. Its movement is simpler, and instead of being tightly enclosed in the breech by a cylinder, it is almost fully exposed, and employs India rubber as an obturator. It is claimed that this gun is not so easily clogged as the Prussian rifle, is more substantially built and is easier to clean; besides the soldier can more quickly discover any accident to his piece. The projectile is a rather long slug with the end rounded and pointed like our rifle ball. The charge, which is attached to it in a paper covering, is composed of a peculiar powder, specially manufactured for the purpose. The gun carries with certainty over 1000 metres. In loading, the lever is turned, with one motion, from right to left and, with another, pulled back; the cartridge is inserted and the lever pushed back. The gun is now ready to be fired. The above facts are condensed from the *Iron Age*.

VINEGAR IN PASTE.—Paper sometimes will not stick to an old wall. Where there is danger of this, some paper hangers use vinegar in the paste instead of water.

TOMATO VINEGAR.—Take one bushel of ripe tomatoes, mash them in an open tub, add one quart of molasses, and thoroughly mix the whole together. Let the tub stand several days, frequently stirring the mixture. When a decided vinegar odor is given off, the juice should be strained from the pomace and put into casks. Vinegar thus made is equal to the best.

Improved Match Safe.

When so many carry matches, a device for easily and safely holding these combustible articles is a desideratum. One of the latest improvements made in this respect is the one here illustrated, for which a patent was granted last year. It consists in a box with hinged pins and catches on the side of the safe to which the pins are attached. By these the box can be easily attached to the garments of the carrier, making it entirely safe to carry matches on the person, and securing them from moisture. It is believed that there are hundreds who will find the device a great convenience, and this especially when hunting, driving or fishing, at the same time that it will also prove valuable for use in houses. The patentee is Mr. J. W. Durham, who may be addressed at Ripley, Tenn.

Merchants in the U. S. and in Europe.

The merchant of America occupies a very different position, socially and politically, from him who pursues the same calling in England or France.

A friend of mine, who had the good fortune to be the bearer of letters to some of the aristocratic circles of London, told me how quick the warmth of his reception

DURHAM'S IMPROVED MATCH SAFE.

was changed to an icy reserve when he incautiously announced his intention to devote himself to trade. And even the polite Lord Morpeth, at a dinner given him in Boston, forgot himself so far as to speak of certain Englishmen who, he said, were nothing but merchants.

In fact, in Europe, the man of aristocratic claims, though he may sometimes condescend to eat the excellent dinner and borrow the money of his wealthy host, still, in his heart, revolts at any attempt on the part of the man who has made his own fortune to indulge in any familiarity or to presume on any intimacy.

"My dear Paul," said the Baron Rothschild, to a little Prince who had done him the honor of dining with him, "I recommend you to try that wine." "I would call you by your Christian name," said the irate little potentate, "if you had any!"—a witticism which cost the Prince his dominions, if the man of money chooses to foreclose his mortgage upon him.

As for the position of the merchant in France, let one of the raciest of French writers describe it. Edmond About says: "When, unfortunately, a young lady is reduced to marry a splendid looking fellow, rich, educated, honest, well reared, and who gains thirty thousand francs a year by commerce, she takes a roundabout way of writing to her fellow-schoolgirl her downfall: 'My husband,' she says, 'is in commerce, it is true; but then it is wholesale commerce. He does his business on a great scale, and besides, he does not attend to it. He is hardly an hour a day at his counter, and besides, he has promised me to withdraw from business altogether in a short time.'"

And her lady friend, who is about to marry an Under-Prefect, with a salary of nine hundred dollars a year, embraces her warmly and says: "My poor girl! yet I shall ever be the same for thee. My husband is above prejudices. I want you to call upon us with your husband as soon as he has kept his promise and got out of commerce."

Thank God, it is otherwise here. We would not boast, even if we could with

truth, that our ancestors for many generations have done nothing with their hands, and if they have undugged anything it has been their servants and not their brains—that our mothers have in their lives handled nothing more heavy than the visiting card, the fan, and the characters of their neighbors. That we came of a family which has always disdained to make itself useful; every member of which has had nothing to do but to be born in luxury and buried in pomp.—*J. B. Felton.*

A GOOD EDITORIAL IDEA.—Dr. Nichols, editor of the *Boston Journal of Chemistry*, has invited the editors of Massachusetts to spend the 20th of September at his "Lake Side Farm," in Haverhill. It is thought that he will have at least two hundred guests that day.

THE SHIP OF THE DESERT.—On the Yuma Desert, some thirty miles west of Los Palmas, a party has discovered, they say, the remains of a ship. The timbers of the bows and some parts of the vessel are in a well preserved condition. The wreck was found at a spot, the account goes on to state, where there was supposed to have been a saline lake.

TWIN CHICKENS.—It is said in the papers and hence it must be true, that a Santa Barbara hen has succeeded, after several

NEW STEAM SAW-MILL.—A mill recently put up at Worcester Mass., is thus described by a correspondent of the *Railway Times*:—"The saw, five feet diameter, is placed directly upon the crank-shaft of the engine. The cylinder is placed vertically above the crank, at the top of a comely pedestal-like frame. It is lively work for the engine (some 450 revolutions per minute); but the machine works quite steady. A 600-pound fly wheel, upon the same shaft with the saw, is a plate wheel, and is turned all over to insure perfect balance.

GRAIN RECEIPTS.—There is still quite a disposition among farmers to hold back their wheat in the hope of better prices. For the above, as much as for any other reason, the wheat receipts are reported at this port, up to the present time, as something like 450,000 centals less than they were at the same period last year. Barley receipts have also fallen off to a small amount, about 20,000 centals; but the receipt of oats has increased 33 per cent.

THE WESTERN UNION TELEGRAPH COMPANY. owns 104,689 miles of wire. The cost of the lines of the Company has been \$12,000,000; of connecting lines in the United States, \$820,000; of rival lines \$1,030,000; of constructing 5,000 miles single wire lines, made necessary by increase of business, \$750,000; 60,000 miles strung on existing poles at 35c., \$2,100,000; making the total telegraphic outlay of the company, \$16,700,000.—*Ez.*

GOVERNORS IN CONVENTION.—One day this week there were assembled in the dining room of one of the hotels in this city, at the various tables, five Governors and ex-Governors of States and Territories of the Pacific Slope, viz:—R. C. McCormick of Arizona, Leland W. Stanford of California, George W. Blasdell of Nevada, George L. Woods of Oregon, and J. Wilson Shaffer of Utah.

SURVEYORS can have their instruments repaired at C. Muller's, 205 Montgomery street. *

CONTINENTAL Life Insurance Co., 302 Montgomery street, cor ner of Pine.

PHOTOGRAPHY.—For Cabinet Photographs, or Enamelled Cards, of the very best quality, you must go to the NEW YORK GALLERY, Nos. 25 and 27 Third street, San Francisco. Every picture warranted to give satisfaction. 10/13 6m B. F. HOWLAND.

BOILER FELTING saves twenty-five per cent of fuel. BERRY & PLACE'S MACHINERY DEPOT, No. 114 California street. 1v21-3m

BLOCK TIN AND SOLDER WIRE, broom wire, piano covering wire, etc., manufactured by Joshua Gray, 437 Brannan street. 2v19-3m

HAVING had numerous applications to purchase the right to manufacture CHAMPAGNE MEAD (the great temperance drink), we will state that we are now prepared to sell State and County Rights on reasonable terms. KENTON, GASS & CO. San Francisco, July 10, 1870. 2v21-3m

DR. HARTMANN, Physician, Oculist and Medical Electrician, cures all diseases of the eye, such as Granulated Eye Lids, Inflammation of the Eye. Opacities of the cornea cured permanently. Also, Paralysis, Rheumatism and all Nervous and Chronic Diseases, and all Female Complaints. 123 Kearny street. 25-52p

TO PACIFIC COAST INVENTORS.

Dangers of Delay.

Situated so remote from the seat of Government, delays are even more dangerous to the inventors of the Pacific coast than to applicants in the Eastern States. Valuable patents may be lost by the extra time consumed in transmitting specifications from Eastern agencies back to this coast for the signature of the inventor, or by reason of return for amendment when addressed directly by the inventor to the Government.

Saving of Time.

In urgent cases for an immediate patent, persons can deposit the amount of the last fees with us, in San Francisco, and have our Washington agent procure the issue of the papers as soon as granted, saving at least several weeks time which would otherwise be required for the inventor to receive notice and then forward the money. Money advanced for this purpose will be returned, should the application be rejected. By adopting this course, we are enabled, with our other advantages, to secure the receipt of patent papers to inventors on this Coast several months sooner than can generally be done, through agents in the East,—without the applicant going to the risk and expense of sending on the last fee before it is known whether the patent will be granted.

DEWEY & CO., Publishers and Patent Agents, Scientific Press Office, San Francisco.

A NEW BOOK FOR MINERS.—We have received, from the publishers, in San Francisco, a new book entitled, "Roasting of gold and silver ores, and the extraction of these respective metals without the use of quicksilver." This is a handsome little volume of 140 pages, treating on the subject quoted, and is a book that should be in the hands of every intelligent quartz miner, mill owner, and owner of quartz in this Territory. It contains an immense amount of useful information, is well gotten up, and is deserving of public patronage in all mining countries. Its author is G. Rustel, mining engineer and metallurgist, author of "Nevada and San Francisco Processes of Silver and Gold Extraction," and "Concentration of all kinds of Ores." Published and sold by Dewey & Co., proprietors SCIENTIFIC PRESS, San Francisco, California. The Press, by the way, is one of the best and most ably edited papers we receive, and we recommend it to intelligent readers as a journal well worthy of their patronage.—*Helena Gazette.*

ining and Company Advt's.

And in accordance with law and an order of the Board of Trustees, made on the fourteenth day of July, 1870, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the residence of Maurice Dore & Co., No. 327 Montgomery St., San Francisco, on the twenty-sixth day of Sept. 1870, at the hour of 11 o'clock A. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

T. B. WINGARD, Secretary.
Office, 408 California street, San Francisco.
Advertising charges \$2.00 per certificate.

NOVELTY MILL AND GRAIN SEPEARATOR.

THE undersigned having purchased of the Patentees, WILKS & SWIFT, of Hudson, Michigan, their right to this mill, patented June 23d, 1869, for California, Oregon, Washington Territory, Montana, Utah, New Mexico and Arizona, wish to call the attention of FARMERS, MILLERS AND GRAIN DEALERS to one of THE GREATEST IMPROVEMENTS OF THE AGE for cleaning and separating grain. While it combines all the essential qualities of a first-class FARMING MILL, it also far exceeds anything that has ever been invented for the separation of grain. It has been thoroughly tested on all the different kinds of mixed grain, separating all the different seeds in almost a magical manner, placed then in their different compartments for their reception, at the same time taking out all the Mustard, Grass Seed, Barley and Oats, and making two distinct qualities of wheat if desired, thereby selecting superior, large plump and perfect berries for seed, and all the small and cut kernels, such as unthreshable wheat, is deposited in another compartment. By the use of this mill a great quantity of wheat usually sown that has been cleaned in the common mills will be saved to the farmer, as the cut or shrunken kernels will never germinate.

The above mentioned Novelty Mill is the only mill known to possess all these superior qualifications, and was exhibited and tested at the last Michigan State Fair held at Jackson, Michigan, September 21, 22, and 23, 1869, and here away the palm over some thirty other different mills from all parts of the United States, including the famous Dickey Mill of Racine, Wisconsin. All who have witnessed here the operations of the NOVELTY MILL, declare it perfection, and the most beneficial invention to the Farmers, Millers, and Grain Dealers ever introduced on the Pacific Coast. The farmers in Santa Clara County, are loud in its praise, and also in other parts of the State where it is being introduced. No. 1 Mill, complete, is capable of cleaning 25 tons of grain per day; No. 2 Mill, 15 tons; No. 3, 10 tons. A large number of recommendations and certificates of the practical working of the mill will be furnished. Circulars containing references sent free by mail. N. B. Town, County, or State rights for sale on favorable terms. For further particulars apply to

R. B. STONE, 422 Battery Street, San Francisco.

ENCOURAGING REMARKS.—One of our readers writes:

"Incorporating an agricultural department into your
paper has made it acceptable and really useful all over
the country west of the Rocky Mountains, and proba-
bly further; and for my part I do not see how an intelli-
gent farmer, miner or mechanic can do without it."

IMPORTANT TO CIDER AND VINEGAR MAKERS.—Wines
and Champagne manufacturers, Merchants and families.
Valuable information imparted relative to machinery,
improved process for making Wine, Champagne, Cider,
Vinegar, etc., also for refining, fermenting, oxygenating,
compounding, etc., fully explained in the Cider Maker's
Manual and sent free by mail for \$1 50. Address
J. S. BUELL, Buffalo, N. Y.

N. B.—Illustrated Circular of Cider Mill Machinery
sent free. 10v21t

McAFEE, SPIERS & CO.,
BOILER MAKERS

AND GENERAL MACHINISTS,

Howard st. between Fremont and Beale, San Francisco.

Flue or Tubular Boilers, with plain circular or spiral
courses. Upright Flue or Tubular Boilers, Locomotive and
and Marine Boilers, and Wrought Iron Tanks of every de-
scription.

Hydraulic Pipe supplied at reasonable rates. In order-
ing, give the quantity of water to be supplied, height of
the fall, and total length of pipe, so as to enable the firm to
determine the diameter of the pipe and thickness of iron to
be used.

Repairs.—Boilers, Smoke Stacks, Pipes, etc., put in re-
pair with promptness.

To Boiler Makers and Machinists to the In-
terior.—The firm is prepared to furnish estimates of
Boilers, and put new Boilers, drilled and punched, and attend
to the selection and forwarding of iron for Boilers, Pipes
and other purposes.

Plans, Drawings and Specifications.—The firm
is prepared to make out Plans and Specifications, receive
estimates, and superintend the Erection of any Machinery
that may be entrusted to their care.

To Inventors.—The firm is prepared to assist in de-
veloping the plans of those who have the ideas but not the
practical experience necessary to put the same in form, by
making Drawings of their Inventions, giving them the bene-
fit of their practical knowledge in the construction of Ma-
chinery, and attending to the manufacture and introduc-
tion of their Inventions. 1v16t

**THE WILSON
Patent Steam Stamp Mill.**

This extraordinary Mill, now so justly popular in the East, is now offered to the miners of the Pacific Coast. Having been in operation now for about two and a half years, the Company feel confident that the

WILSON STEAM STAMP MILL,
For Durability, Efficiency,
AND ECONOMY OF WORKING,
HAS NO EQUAL.

The Wilson Steam Stamp Mill is the only Steam Mill that has had the severe ordeal of practical working, and proved itself eminently successful. It is now in operation in several of the Eastern States and Territories, and is gaining an enviable popularity. The whole machine is so simple as to be readily understood by the most ordinary minds. In fact, its simplicity is its durability. The expense of crushing rock or cement with this Mill is less than one-half the expense of any other Stamp Mill, and less than one-half the cost. For further particulars inquire of

FURMAN R. WILSON,
San Francisco.
Or of THE WILSON STEAM STAMP MILL CO., 326
Walnut Street, Philadelphia, Pa.

NOTICE.—All persons are hereby warned not to manufacture or use any Steam Stamp Mills that are an infringement on the Wilson Patents, as they will be prosecuted to the utmost rigor of the law.

F. R. WILSON,
Supt. W. P. S. S. M. Co., Philadelphia.

Thursday Evening.

Owing to the time necessary to mail the present large edition of the SCIENTIFIC PRESS, we are obliged to go to press on Thursday evening—which is the very latest hour we can receive advertisements.

PAIN KILLER
PROF. J. PERDY DAVIS & SON, PROVIDENCE, R.I.

1840 1870

The "Pain Killer,"

After thirty years trial, is still receiving the most unqualified testimonials to its virtues, from persons of the highest character and responsibility. Physicians of the first respectability, recommend it as a most efficient preparation for the extinction of pain. It is not only the best remedy ever known for Bruises, Cuts, Burns, &c., but for Dysentery or Cholera, or any sort of bowel complaint, it is a remedy unsurpassed for efficiency and rapidity of action. In the great cities of India, and other hot climates, it has become the Standard Medicine for all such complaints, as well as for Dyspepsia, Liver Complaints, and other kindred disorders. For Coughs and Colds, Canker, Asthma and Rheumatic affections, it has been proved by the most abundant and convincing testimony, to be an invaluable medicine. Directions accompany each bottle.

Sold by all Druggists.
Price 25 cts., 50 cts., and \$1 per bottle.

**TARRANT'S
SELTZER
APERIENT.**

MENTAL MADNESS.—Let us hope that the insane practice of administering poisonous evacuates in cases of indigestion, hitherto, constipation, and female debility, is almost of date. When the Tonic-Cathartic produced by Nature herself in the most valuable Sanitary Spring in the world is re-produced by science, in the form of TARRANT'S SELTZER APERIENT, it is indeed midsummer madness to rack, relax and irritate the diseased or enfeebled system with drastic purgatives. This refreshing and delicious counterpart of a remedy, prepared by the creative hand of the Omnipotent Physician Himself, is everywhere superseding the nauseous and sickening compounds heretofore used as laxatives.

SOLD BY ALL DRUGGISTS.

The SCIENTIFIC PRESS devoted to mining, farming and the mechanic arts, and is inferior to no publication of the kind in the United States.—Ouyhee Advocate.

The SCIENTIFIC PRESS is one of the most interesting of our Exchanges, and is specially devoted to giving full accounts of mines and all new inventions and improvements in mining machinery, and machinery of all kinds. It also contains a general review of mining operations in all parts of the United States, with an epitome of the latest mining news, selected from the local papers of each district. All very interesting to miners and machinists.—Helena Gazette.

Paul's Electric Dry Amalgamating PROCESS.

HAVING FULLY PROVEN UP THE VALUE OF THIS SYSTEM, I would call attention to the mining community to its efficiency, practicability, and cheapness. I am now prepared to furnish all the machinery requisite for thorough working by this process, viz.—one Crusher, one Pulverizing Barrel, one Amalgamating Barrel, two Settlers and one Concentrator, at the following rates, approximate weights.

A 10 ton Mill for \$1750	8 1/2 tons.
A 5 " " " \$2500	6 " "
A 2 " " " \$1000	3 " "

which includes patent rights.

I would call special attention to the 2 ton mill, which is cheap in construction, a mill much needed, as it can be worked by one man easily. The process is superior for flour gold, and highly efficient on silver ores.

ALMARIN B. PAUL,
408, California Street, San Francisco.

Pamphlets, explaining process, forwarded on receipt of address.

Testimonials as to Process.

DEEP SPRING VALLEY, California, August 13, 1870.—
Mr. Almarin B. Paul—Dear Sir,—Your request that I should give you a statement of comparative results as obtained by our former working by pan process on ores containing gold and silver associated with lead as a sulphuret, carbonate and oxide, as also antimony and iron, with your process as now erected and worked at this mill, I cheerfully comply with. The product from working 2 tons of San Juan ore by our former pan system, showed bullion only 148-1000 fine, value of 19 cts. per ounce, while the product of the first practical test of 11,800 pounds of ore very imperfectly pulverized, and working 500 pounds at a charge of same ore from the same mine and carrying all the above named base metals, was 925 & 935 1/2-1000 fine, and the product per ton over FOUR TIMES THAT OBTAINED BY PAN WORKING without what will be extracted by your mode of working the concentrations. I would state further that I fully realize the fact of your ability to handle what may be termed base metal ores by amalgamation, and extract the precious metals to a higher percentage than pan amalgamation, and that your bullion will range from 925-1000 to 980-1000 fine. Your process is thoroughly practical for working on a large scale, and a valuable acquisition to metallurgical science, and worthy the consideration of the mining community, especially where Lead, Copper, Antimony, Arsenic or Iron interferes with amalgamating the precious metals.

GEO. LANGRIDGE, Supt.
Deep Spring Valley Mining Co.

(Letter from Professor Thomas.)

As one of the stockholders in the Deep Spring Valley Mining Co., I happened to visit the mill at the time the above process was tried on the complicated ores then on hand, and I hereby certify that with very defective mechanical arrangements which were extemporized for the trial, and which did not reduce the ore to anything like a respectable fineness, Mr. Paul obtained bullion worth 127 cts. per ounce. The great problem of obtaining fine bullion from ores that are highly loaded and vitiated by antimony, copper and arsenic, without first of their costly process of oxidation, has been solved for the first time by Mr. Paul's new process. I will further state that the quicksilver appeared to my eye to be as vital and active at the end of the process as when it commenced. On the whole, I am convinced that Mr. Paul's process with his perfect machinery, will achieve all that he claims for it.

R. THOMAS.

601 California Street.

HOWLAND PATENT ROTARY BATTERY
of 12 stamps. It requires no frame to put it up. Guaranteed to crush 1 1/2 to 3 tons per day to the stamp. The best Battery ever used for amalgamating gold, or crushing silver ores, dry or wet. Can be put up on a mine in running order for one-half the price of the straight battery, and in three days after its arrival at the mine. 12-stamp battery, 20,000 pounds, with frame complete, price \$3,000; 6-stamp battery, 8,000 pounds, price \$1,500. All prices named to be paid in currency. Every mill run at stop before shipping.

California Stamp Mills.

All the various styles of Pans, Amalgamators, Separators, Settlers, Concentrators, Dry or Wet for working Gold, Silver or Copper Ores, the same as built in California and at lower prices. SHOES AND DIES made of the best white iron. Send sizes and we will make patterns and forward Shoes and Dies at low prices. Engines, Boilers and fixtures, and other Machinery made to order. Also, Howland's Patent Rotary Valve Double or Single Engines.

Irons for the best California 10-stamp mill, straight battery, complete, \$1,000. Irons for low mortar, old style mill, much less. 67 Send for a Circular.

95 Liberty street, New York.

N. B.—Mr. W. H. HOWLAND, formerly of the Miners' Foundry, is now in San Francisco for a short time, and will receive orders for mining and other Machinery of Eastern manufacture at the lowest rates and most favorable terms. Orders may be left at S. W. HOWLAND & CO'S, 413 and 415 Mission street, between First and Fremont, San Francisco. 4v21-3m

**VARNEY'S
PATENT AMALGAMATOR.**

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the miller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The centrifugal force again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Settlers made on the same principle excel all others—they bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and settlers for themselves, at the office, 229 Fremont Street, San Francisco. 1v1

PATENTS BOUGHT AND SOLD ON COMMISSION.

Fiscus & Arney's Improved Washing Machine.

There is probably more inventive talent employed from year to year on machines for washing clothes, than on any other class of inventions; and yet at the present day, we have but very few Washing Machines of any practical utility. The one we are about to describe, however, is not merely a device with a handle and a name but a real labor-saving machine for practical every-day use. It is simple in construction and more simple in its operation. The tub, or box in which the clothes are cleaned is provided with an adjustable corrugated rubbing board. This stationary rubber is full of small openings and is placed a little above the bottom of the tub in order that the dirt may be precipitated as fast as removed from the clothes, and leave the garments floating in clean water. The dirty water and sediment in the lower apartment, can be removed at any time through an opening in the bottom of the tub without disturbing the clothes. The machine is put in operation by means of a crank, and the operator is not compelled to stoop and steam over hot clothes, and be splashed with dirty water. The machine is perfectly closed while in operation. The upper, or working rubber adjusts itself to the smallest handkerchief or to the largest blanket, without any effort on the part of the operator. While in operation the weight of the upper or working rubber, is constantly pressing and rubbing the clothes, and the action is rapid and gentle, not breaking the buttons and wearing tearing the garments. It would be difficult to enumerate in a brief advertisement all the superior merits of this novel invention. It can be built by any ordinary mechanic, at a moderate cost, and allow a handsome profit. It was patented April 26, 1870 by Elias Fiscus and Solomon Arney, of Allhion, Iowa. State and County rights for sale at reasonable prices. Complete drawings can be seen at our office and full information obtained by addressing
WIESTER & CO., Patent Brokers,

CLAY'S STEAM COOKER.
(PATENTED NOV. 23, 1869.)

A cheap, simple and practical invention that can be used with any Cooking Stove and the following advantages gained:
1st. It saves twenty five per cent in time and fuel over the ordinary method of cooking. 2d. It prevents the possibility of scorching, or burning food, while it is being cooked. 3d. No heavy, smutty, greasy pots and kettles are to be handled and cleaned; but light tin dishes that come out of the Cooker, with nothing but drops of clean water on them. 4th. No odors can escape to fill the house, and attract the flies, and the flavor and nutriment are perfectly retained, rendering the victuals more palatable and healthy than when prepared in the ordinary way. 5th. It can be used alone over a gas burner, or camp fire, and the food when cooked, keeps warm almost indefinitely. Mr. H. L. Southworth, President of the National Hotel at Salt Lake City, who has been using one for some time says: "I predict for it an entrance into the palace of the wealthy, the cottage of the peasant, the camp of the miner and the tent of the soldier, or wherever intelligence shall seek to take advantage of the improvements of the age." A complete working model can be seen at our office, and any person wishing to buy a County or State Right, can have the satisfaction of thoroughly testing its merits before investing his money.
The best HAY PRESS on the Pacific Coast. County Rights, State Rights and Presses for sale.
NEW GAS LIGHT for City and Country. BEAUTY, SAFETY and ECONOMY combined. You can buy a County Right for a few dollars and get the Lamp at cost prices. A full description furnished on application.
The only complete MUSIC FOLIO and PAPER FILE HOLDER yet invented. Samples of either furnished on application. The entire Patent or State Rights for sale cheap.

Asphaltum Pipes.

We have large deposits of asphaltum in our State. The principal ones are found in Santa Barbara county, where it is found from the Santa Maria river, which forms the division line between this and San Luis Obispo counties, to the boundary line of Los Angeles. But it is found also in many other places. It occurs in varied forms, as a hard rock-like substance, or soft, like putty, or even liquid. Many springs on our coast deposit it, while in some places there are springs which do not yield asphaltum, although in the midst of those which do. These deposits are efficient to supply a very large demand. Previous to 1867, most of this material used in San Francisco was brought from Santa Barbara county, some from Los Angeles; but since that time other localities also have furnished us with greater or less amounts.

The use of asphaltum for pavements was introduced into this city in 1855. After many years of trial, we find it still used with increasing satisfaction, so much so, indeed, that, in the late report of the special Committee on Pavements of the Board of Supervisors, it is recommended that "the present popular plan of making sidewalks of this material be continued and encouraged."

For roofing purposes large amounts are also used. The Spring Valley Water Company have employed it for coating their pipes, lining their reservoirs, etc., etc. And there are several other ways in which considerable amounts are consumed.

It is of comparative recent date that we have pipes made of this material in this city. Many experiments have hitherto been made here and elsewhere, but until recently without the desired amount of success.

The subject of drainage, sewer and water pipes is now most important, and continually increases in importance as our cities increase in size. We see it stated that, in San Francisco alone, there has been expended over \$300,000 annually for the last dozen years, in laying down brick and wooden drains, etc. Most of these will have to be taken up soon and replaced, for the wooden ones are rapidly destroyed, and the brick ones permit their liquid contents to penetrate their pores and saturate the surrounding earth. The trouble is increased, moreover, by the miserable material which has been used by contractors in some instances, it is asserted, for building the drains. To put down pipes, which, although cheap in the beginning, must be renewed every few years, is folly, when we can get others which will last an indefinite length of time, and arrant stupidity, when we can get durable ones which cost as little or less.

The use of asphaltum in the manufacture of pipes has been tried sufficiently long to demonstrate the superiority of the article for many purposes. In France and other parts of Europe, asphaltum pipes have been in use for many years, and that

It may be more difficult to see how asphaltum pipes can have the required strength to resist pressure from within and from they give satisfaction, is shown by the increasing number laid.

As asphaltum does not oxidize, is not dissolved by the solutions which come in contact with it when laid in the ground, it has in these respects a decided superiority over iron or other metals, which are much less durable. Moreover, for the same reason it gives a cleaner water, which is a most important item for manufactures. Pipes of asphaltum, laid in Paris in 1851, have been taken up more than fifteen years after having been laid, and were found to be in the same condition as when laid down, which is a remarkable evidence of their great durability. It is well known that iron pipes are coated over with asphaltum, before being laid, in order to protect them from the various destructive agencies to which they are exposed.

PIPE JOINT FOR ASPHALTUM PIPES.

without. Of course their strength depends greatly on the manner in which they are made. Our readers will find an account of how asphaltum pipes were made in a factory in this city, in the SCIENTIFIC PRESS of April 16th of this year. There it was shown how a fibrous material was saturated with melted asphaltum and wound into cylinders of the desired size. The thickness of the pipe can be increased at will, and thereby also the capacity of resistance. In Paris, were we told, where the manufacture of this kind of pipe originated, experiments made to test their strength against inside pressure were carried so far as to show that they can easily be made to resist a pressure of 500 pounds to the inch. These experiments were repeated at Hanover with like results. Indeed the company here will undertake to manufacture asphaltum pipes capable of resisting a pressure of 600 pounds to the inch. In the experiments alluded to, not only single but also connected pipes were tested. In London, according to experiments made by Mr. Samuel Hughes, C. E., the power of resistance of these pipes against outer pressure is so great, that they are capable of lying under the highest dam in complete security, supporting with all facility the unequal pressure thereby exercised.

The elasticity of these pipes protects

them from being fractured by sudden shock or concussion, as often happens to other kinds of pipes; and as their expansive power is greater than the expansion of frozen water, they have the peculiar property not possessed by any other pipe,—that of not being burst by the freezing of the water.

Another advantage, of great importance where much freighting is necessary, is the great lightness of the pipe. Its mean weight is given as about one-fifth of that of the same sized iron pipe. This not only diminishes the cost of transportation, but also decreases the expense of laying it down.

About two years ago, a gentleman of this city, after years of experiment, succeeded in making pipe of this description, and applied for a patent, which was, as he thought a California invention. A patent was refused, as a precisely similar invention, which originated in France, had previously been patented in the United States. The gentleman, who is spoken of in our pre-

lower figure. As the joints are ground they fit securely and tightly, and nothing further is necessary. Hence any man can lay the pipe, and it is not necessary to send a special mechanic for the purpose, and thus one important item of expense is saved the purchaser. This is certainly a noticeable feature in this joint. When the joint is thus made, moreover, a straight pull will not separate the pipe, unless a great force is exerted, as it is necessary, (since the joint is ground) to give the end a twist in order to remove it with any moderate effort.

The company are now making six sizes of pipe, which vary from two to six inches in diameter, but they are prepared to make them of diameters of eight, ten and twelve inches. The pipe is made in lengths of twelve feet and is manufactured for water, telegraph, blast and ventilator, and drain conduits. The factory now employs eight men and can turn out about one thousand feet of pipe daily, but the company intend doubling its capacity. Thus their enterprise is growing into an important business and bids fair to become one of the largest of our home industries, employing as it will quite a large number of persons in the manufacture of the pipe and, in addition, giving work to others in extracting the asphaltum and preparing it for use, and making of more general utility one of the natural products of our State.

The efforts of the company have thus far have been very successful. Already they have had orders for the pipe for use in San Francisco, Santa Clara, Petaluma and Colusa. They have, indeed, already laid some ten miles of pipe in this State, and as so far it has given the greatest satisfaction, they are continually receiving further orders. The strength of the material, its durability, its exemption from oxidation, from being acting upon by acid or alkaline solutions, its freedom from affecting the water, its density and impermeability, its elasticity, lightness and consequent ease of handling and laying it, and finally its cheapness recommend it to the careful consideration of all. The cost of the pipe when laid, including connection, is about one quarter of that of lead and one half that of iron.

DESTRUCTION OF FORESTS.—The report of the U. S. Department of Agriculture comes to the startling conclusion that, such is the wholesale destruction of the American forests, there will be an actual famine for wood in the country within thirty years, unless immediate measures are taken to supply their places by new plantations. It is estimated that, from 1850 to 1860, twenty million acres of timber land were brought under cultivation, and that in the present decade no less than a hundred millions will be so reclaimed.

It is stated that there are forty-eight manufacturing factories of railway cars in the United States and that Pennsylvania has seventeen of these.

Notes of Travel in Placer County.

[Written for the Scientific Press.]

Last Chance—Star Town—Damascus—Iowa Hill.

Last Chance is the name of a beautiful little village situated on the highest elevation of the northeastern portion of this county. The distance by trail from Michigan Bluff is 15 miles, but by no good wagon road is it less than 90 miles. The place is very improperly named, for instead of its being the last chance to make a raise, it is among the first—every man at work upon this hill at either mining or gardening is doing well.

The principal mines are situated at Star Town, two miles farther east. This latter place is suspended (fast) to a side hill at an angle of 45 degrees. Here the ladies in winter season go visiting on snow shoes, the snow some winters falling to a depth of 20 feet on a level. Contrary to other parts of the county, they have plenty of water in summer, but cannot work successfully in the winter on account of the water freezing. The Viola Mining Co. have a tunnel in about 1,000 feet, working 10 men, with an average of \$8 per day to the man. The proprietors are Yule, Leet & Gould. Hon. John Yule is Supt. The Morning Star claim, Smith & Co. proprietors, are in about 1,500 feet with their tunnel, working 15 men, and are getting out from \$7 to \$10 per day to the man. These claims are deep channels, blue gravel, and slightly cemented.

On the adjoining divide are situated Damascus and Iowa Hill. At the latter place there is little or nothing doing; at the former, the Lewis claim and the Mountain Gate are making things lively. The latter company are working 25 men, and have their bed-rock tunnel in 4,000 feet. The yield of this mine is a good average (satisfies its proprietors.) These diggings are deep channel; some pay from the top down. Some spots in the main lead, near bed-rock have to be crushed, so hard is the cemented gravel.

Colfax—Gold Run—Dutch Flat.

Colfax is looking up; its quartz mining and prospecting show about as much activity as any other part of the county. The Montana Quartz Mining Co. have a shaft down 81 feet on a ledge 8 feet thick that prospects well. P. McMahon is President of the Company and Acting Manager. This Company has purchased a 10-stamp mill, at Forest Hill, and in a few days will have it in active operation on the claim. The Rising Sun has a 5-stamp mill on their ledge. They own 3,000 feet of a vein that has paid from \$300 to \$400 per ton, and has at all times averaged well. They have been running night and day, and do no custom work. The Montana Mill will be the opening up of this district, for they will be able to do custom work.

The Live Oak, situated 6 miles from here on the American River, has paid regularly \$37 to the ton.

Gold Run is a point (together with Dutch Flat,) which, if more was known of it by tourists, would be visited more than any other mining section in this State, for in less than one hour's time (foot travel,) more can be seen of what has been done than in any other portion of the mines. The diggings are deep channel, with three strata, averaging from 100 to 300 feet deep to bed-rock, all of which have more or less pay in them. The top stratum is a red gravel, the middle stratum a blue gravel and the bottom (extending down to bed-rock) a blue cement, which requires either to be blasted or crushed by mill process, to obtain the precious metal from it.

The principal Hydraulic Claims at work here (Gold Run) are at Iodiana Hill, and are owned by Messrs. Brogan, Hoskin & Judd. They use both the Monitor and the Dictator nozzles. The former (Craig's Patent) seems to have the preference. With 200 feet fall they put 450 inches of water through a 4 inch nozzle, and claim to do more execution with such a stream than with eight 100 inch streams. At the request of many (whom I find using the Monitor) I will give your readers an explanation of its merits.

In the White Mountains.—No. 1.

BY ALMARIN B. PAUL.

[Written for the Scientific Press.]

I will anticipate my readers who may ask, as many have done, "Where are the White Mountains?" by stating that they are located east of the Sierras, and lie between the this range and the westerly line of the State of Nevada, stretching from a point where they touch the Nevada line, southerly to where the same range takes the name of the Inyo Mts., being some 80 miles in length. They were formerly in Mono Co., Cal., but lately, by act of legislature, transferred to Inyo Co. Here is a belt of mining country little known by the mass, but which has been much explored by the few. Up to within the past few years, it has been quite unsafe to venture in this region, on account of the Indians, who were unfriendly to the whites; but this trouble is all done away with, and I must say, I found them the most friendly and happy tribe that I have met anywhere. The western line of the belt drops off into plains and valleys—Owens' Valley bordering on it for 50 miles. To the eastward, the mountains rise to great heights, say from 8,000 to 12,000 feet above the sea, then fall, range after range, as far as the eye can reach.

Although these ranges, as a whole, may be comparatively perfect, yet the disturbance has been such that, viewing them in a smaller circle, they are irregular and disconnected. Everything denotes great disturbances of nature. In some parts it is evident that mountains have been lifted bodily and turned upon their sides, bringing what otherwise would be perpendicular strata to horizontal positions. The higher peaks carry timber of the pine species, but of larger growth than is usual for the Piñon, while a little lower down the regular Piñon is abundant; lower still sage brush and barrenness generally fill the eye. It is a rough, rugged, hold country. The higher ranges are slate, the lower granite, and all are ribboned with quartz strata. The slate carries deposits of base metals, mainly galena, and all carry more or less of the precious metals.

The leads in the slate are large, and from surface indications, show evidences of being permanent. But little work by way of development has been done from the want of capital and difficulties of isolation; more the former, however, than the latter. The climate is splendid in summer and not cold in winter. All it wants is capital and population to make an advancement.

As is usual where there are high ranges, there are fine mountain streams which afford power for machinery, and a whole some beverage for miners. The two most prominent of these are Wyman and Cottonwood creeks, either one of which would afford power for hundreds of mills. In the granite formation, the lodes are smaller as a whole, though there are ledges 6, 8, 10 and 14 feet wide, all carrying gold and silver in greater or less quantities. Lead as a sulphuret, carbonate and oxide, with some antimony and a little copper, prevades about all the ore. The quantity of galena is not sufficient for smelting, consequently the only method for getting the precious metal is by amalgamation.

There are several individuals operating in one way and another, and the country, we may say, has the nucleus of what is to be a prosperous community. There is one mill in the range, that of the Deep Spring Valley M. Co., hut of this and of Deep Spring Valley District, I will speak in my next. San Francisco, Sept., 1870.

From Utah Territory.

[Continued from page 186.]

Salt Lake City.

Salt Lake City is situated about 20 miles westerly from the lake at the foot of a spur of the Wahsatch mountains. It was formerly reached, from the East, through Emigrant Cañon, this and Parley's Cañon forming the approaches on that side. The scenery here is fine, the mountains forming an imposing feature, their tops being covered with Pine, Maple, Oak and other timber and their sides having in places a reddish tinge, and here and there snow being visible. The city itself is pleasant to the view. Here are broad streets, 132 feet across, running, at right angles, to the four points of the compass, with rivulets of water pouring down their gutters. Rapidly growing fruit and shade trees adorn the gardens and

afford an enticing shelter from the heat of the sun. Hidden among the foliage, the adobe buildings seen pleasant and inviting to the eye. To the west we can see, from an elevated point, the lake spreading out before us, with several islands jutting out from its bed, which islands are utilized for herd grounds, sheep ranges and salt works. The population, estimated at 20,000, is quiet and orderly. There are but few saloons, for a license costs \$600 to commence with and \$300 monthly thereafter, and this alone is sufficient to keep the number small. There is but one billiard saloon in the place, I am told.

The public buildings are principally of stone and well constructed. The Tabernacle, I refer especially to the new one, is a famous piece of architecture and is noted throughout the world. The square opposite, where Brigham Young's residence is, is equally grand. There are good hotels and large stores. My first impressions are certainly most favorable, and the apparent cleanliness and taste make me think this a most beautiful place.

A Bit of History.

The following historical items have been given me and will undoubtedly interest many.

On July 24th, 1847, the pioneers of the Church, about 143 in number, entered Salt Lake Valley, having left the Missonri river on the 14th of April of the same year. On the day of their arrival they commenced plowing and planting, and on the 26th of August had laid out a fort, built 27 log houses, plowed and planted 84 acres with corn, potatoes, beans, buckwheat, turnips, etc., and had manufactured 125 bushels of salt. One year from this date, in August, 1848, the city fort contained 450 buildings, with 3 saw-mills and a flour mill in the city.

On March 9th, 1849, President Brigham Young was elected Governor. On the 27th of that month parties from the East bound for the California gold mines first arrived. On June 15th, 1850, the first newspaper was published, the *Deseret News*, and this, edited by Geo. Q. Cannon, is now the leading paper of the city. January 7th, 1854, John C. Fremont with 9 whites and 12 Delaware Indians, arrived at Parowan in a state of starvation. One man had fallen dead from his pony and others were nearly at deaths door. They rested a few days, were supplied with animals and provisions and then started off again on their prospecting tour.

About Jan. 26th, 1856, an express company was organized to carry express matter from the Missouri River to California, and shares were taken at a mass-meeting held in this city to stock a thousand miles of the road. On October 18th, 1861, the first telegram crossed the Overland wire from Utah, being a message sent to Abraham Lincoln by Brigham Young, and on October 24th, Brigham Young sent the first telegram to San Francisco.

In June, 1868 the Union Iron company commenced operations at Pinto Co.

The Lions of Salt Lake City.

Of course the first place one visits is Temple Block, which is in the centre of the city. In this magnificent square, gilt with trees, are the Temple (in course of construction), the Old Tabernacle and the New Tabernacle. The foundations of the Temple are laid 16 feet below the surface, and on them rest walls, 8 feet thick, of light colored granite from Cottonwood Cañon in the Wahsatch mountains. The corner-stone was laid April 6th, 1853. The walls will be built of a fine quality of granite and there will be six large towers. The length of the building will be 186½ feet and the width 99 feet. The cost will amount, it is estimated, to upwards of three million dollars. The Old Tabernacle, built of adobe, was erected in 1851. It is used for public worship when the larger building is not required, although it is itself of no mean size, being capable of seating 2,500 persons.

The New Tabernacle is in many respects a wonderful building. It is of oblong shape, 250 feet from East to West and 150 feet from North to South. The roof is a single oval span, 80 feet high, and rests on 46 pillars of red sandstone, 9 feet by 3. The ceiling is 62 feet above the flooring. There is, at one end, a large gallery or raised platform for the organ and choir. This hall, perhaps the largest in the world, will seat between eleven and twelve thousand persons, and here are assembled on a Sunday afternoon such a congregation as is to be found hardly anywhere else.

The great organ, now being built, must not be passed by without mention. This is the third in size in the United States, being 48 feet high, 27 feet wide and 30 feet deep, and having some 3,000 pipes. But to my mind the most remarkable fact about it is, that, with the exception of the pipes, which are imported, all the material was obtained from this territory and all the work is being done by Mormons, who show themselves in many ways to be skilled artificers. The builder is Mr. Jos. Ridges, and the estimated cost is 150,000.

The Court House, the City Hall with the prison behind it, and the Theatre all deserve mention. The latter is finely furnished and well appointed, and is capable of seating 1,700 persons. Nor should the Museum be allowed to pass without mention. Mr. John W. Young commenced collecting specimens of the various products and curiosities of the territory in 1869, and ample addition have since been made, until it is grown to be a most interesting affair. The building is one

of the first erected and President Young himself assisted in building it. From this Museum you will have received a number of specimens to be placed in your cabinet.

There are other points of interest here:—the Hot Springs, with waters of a highly medicinal character, Camp Douglass, 2½ miles to the east, on high grounds, with quarters for 3,000 troops; etc., etc. Nor must I forget the Salt Lake House and the Townsend House, two hotels of the very first class.

There are three papers published here:—the *Deseret News*, edited by Geo. Q. Cannon, one of the Twelve Apostles, issued daily and semi-weekly; the *Salt Lake Tribune*, issued weekly by Godbe and Harrison, and the *Salt Lake Herald*, a weekly sheet.

W. H. M.

[TO BE CONTINUED.]

The Leviathan Mine.

[Written for the Scientific Press.]

Observing in your valuable paper, from time to time, paragraphs containing details of the operations going on at the Leviathan mine, it may perhaps be interesting to some of your numerous readers to know something of the character of the property, which belongs to a gentleman of high commercial standing in the city of London, and is now being developed by his own unaided efforts.

The mine is situated in Alpine County, about five miles from the town of Monitor, having a good natural outlet from the hilly country into Carson Valley, which, with a small outlay, might be converted into a road practicable at all seasons of the year. Its geographical formation consists of metamorphic sandstone overlying a blue boulder clay cement deposit, dipping to the east. Four or five years ago some enthusiastic prospectors, attracted doubtless by the magnitude of the ferruginous croppings, opened a tunnel into the sandstone with a view of searching for gold and silver, and after proceeding some three hundred feet in a northerly direction without meeting with the object of their search, struck a large body of copper ore of a high percentage, but which did not rise more than a few feet from the floor, although showing itself in spots on the surface over an area of more than one hundred feet; in fact, from all explorations made up to the present time, it is quite evident this valuable body of ore would not have been discovered at all had the tunnel been started twenty feet higher than its present level.

Nothing further appears to have been done from that time, until the mine was taken in hand by its present owner, about twelve months ago, since when its development has been vigorously proceeded with, about 200 tons of high grade ore, from 30 to 50 per cent. copper, having been removed in the course of the exploring operations, during the month of May, June and July, which, after being crushed and roasted, is particularly adapted as a raw material for the manufacture of sulphate of copper, owing to its unusual freedom from lime and iron. It consists chiefly of black and red oxides, green silicate and carbonate, with gray sulphide, and occasionally streaks of metallic copper.

A lower tunnel has been run, at a depth of 176 feet below the upper, through the cement formation, with a view of cutting the sandstone and thereby draining the water now coming up in the floor of the upper works, which limits the production at present to the over-head, dry portion of the deposit of ore—the points or irregularities of its upper surface. This object will probably be attained in the course of a week or two; when an incline will be commenced which will enable the ore to be taken out at a very low rate.

Two excellent blast furnaces, with a 15-horse engine and No. 3 Root blower, have been erected for smelting the ore, and, from its very favorable character for making sulphate of copper, it is probable the operations may soon be extended to the more profitable manufacture in question. In fact, I am given to understand that the spirited proprietor of this interesting property has it in contemplation to erect extensive works for the manufacture of sulphuric acid, with a view of converting a large portion of his ore into bluestone, which operation will probably, ere long, constitute him the most extensive manufacturer of this article on the Pacific Coast.

It is gratifying to find English capital being invested in bona fide undertakings of this nature, which will go far to wipe out the stigma which was cast upon us in the English mining community some few years ago, by the cruel swindles which had been perpetrated by a set of unprincipled adventurers, who had misrepresented California and the Pacific States in that and other markets. Since, however, capitalists have wisely adopted the system of inspecting and testing mining properties before parting with their money, mining swindlers have been compelled to abandon their glaring outrages on common sense, which they found so effective and successful some few years ago.

CARSON.

Mechanical Progress.

A SIXTY-TON LOCOMOTIVE.—The "Tarapaca" is the engine just finished at the Hatcham Works, Eng., for the Iquique Railway in Peru. We quote from *Engineering*:—"This is the largest engine yet constructed on the Fairlie system, and is, indeed, one of the most powerful locomotives yet constructed on any plan whatever. It is carried on twelve 3 ft. 6 in. wheels, arranged in two groups of three pairs each, the wheels of each group being coupled. Each of the bogies has a pair of 15 in. cylinders, with 20 in. stroke, and as the boiler pressure is sufficiently high to maintain an average effective pressure of about 100 lb. per square inch on the pistons, the tractive force which the engine is capable of exerting is 21,430 lb., or about 9½ tons. It would therefore easily haul, on a level and at moderate speed a 2000 ton train. The weight, in working order, is about 60 tons."

FRENCH BRONZE VS. GERMAN STEEL.—The London "Times" has an article upon the inferiority of the French bronze field pieces to the Whitworth steel guns, as evidenced by some of last year's experiments at Chalons. The inference from these experiments is, that these same field pieces have in the present war been at a great disadvantage against the steel guns of the Prussians. Opportunities have repeatedly offered to open a deadly fire at long distances, but the French guns are too weak to bear so large a charge as would be necessary with a sufficiently low elevation to admit of accurate aim. *Engineering* remarks upon this point:—"The bronze gun is of less than half the strength of the steel gun, and the consequence is that a light shell, which flies high and not very accurately, and is spent before it reaches far, is the only projectile that you dare to fire from it. For example, suppose you wish to obtain a range of about two miles. With the French bronze gun you have to give an elevation of about 20 deg., and consequently fire your shell 420 metres high into the air in order to make it reach the distance, and when it does reach its velocity has dropped from 343 metres per second to 160 metres. The Whitworth 10-pounder steel gun, on the contrary, in order to obtain the same range, has only to be fired with an elevation about 10 deg., and consequently never rises higher than about 180 metres, and when it reaches the two mile distance retains a velocity of 257 metres per second."

MINIATURE LOCOMOTIVES.—The *Iron Age* has the following:—"Baird & Co., of Philadelphia, have built, during the year, a number of small locomotives for use in mines, adapted to narrow gauges of 2½, 3 or 3½ feet. The Thomas, the Lehigh, and the Glendon Iron Works, are each working two of these for hauling away cinder from their furnaces. At the former the two engines do the work which formerly required thirty mules. For out-of-door work the little engines are built with outside cylinders 9 inches in diameter and 12 inches stroke; the driving wheels are 30 inches in diameter. For mining purposes the cylinders are placed inside, the extreme width is reduced to 5 feet, and the extreme height to 5 feet 4 inches. These engines, in complete working order, with tank of water on boiler, and a man on the foot-board, will weigh only from six to eight tons."

ELECTRIC MOTOR.—The N. Y. *Engineering and Mining Journal* describes a machine consisting of a series of electro-magnets arranged around a fixed center, with a series of armatures revolving around them. This machine is six inches long and six to eight in diameter, and with a battery of four cups will drive an ordinary sewing machine. The "next size larger" will pump water, and "will probably produce the same amount of work as a man." Is this another of those like announcements so many of which have in turn gone the newspaper rounds once and been forgotten?

RANSOME STONE.—This is in favor in India. The preserving solution used by Mr. Ransome has been used at Bombay with such good effect upon the very perishable natural building stone of the country, that the Government intends to go into the manufacture of the artificial material.

MILITARY USES OF PHOTOGRAPHY.—Among these are now the illustrating of ordnance drill, by a series of about a hundred different views, showing the various positions in their order, and in fact every thing connected with the practical working of the various kinds of guns, mortars &c. By study of these pictures, raw recruits can soon familiarize themselves with their duty. Each man bears his number upon his cap in the picture, so that his position can be followed throughout the series. Another use of the art is in recording, by a series of views, the experimental results of gunnery trials. The targets are photographed on all sides after each shot, and the effect thus accurately preserved for reference. Another is in the sending to the different military stations, with newly adopted equipments, carriages, ambulances, tents, cooking apparatus, &c. &c., photographs illustrative of all the details of their setting-up and management; no slight aid to those called upon to use a new thing for the first time. Thousands of these pictures are printed and sent to the English stations by the Government. These are now done by the carbon process; ordinary silver prints being liable to fade, and to become stained, after a time, by the presence of sulphur either in the paper itself, or in the atmosphere.

PLATE MOULDING.—We take the following description from a notice of the brass foundry at the Stamp End Works, in London *Engineering*:—"A number of half-patterns of articles to be moulded are fixed to a metal plate slightly larger than the flask in which the mould is to be made, connected by necks which will produce in the moulds the necessary runners for the metal. The plate is made so that the flask fits on to it in one position, and when placed it is filled in with sand and rammed in the ordinary way. On the filling being completed it is lifted off the plate, which is then ready to receive another flask, and so on. Of course the moulds thus made will be all "tops" or all "bottoms," as the case may be, and another plate carrying another set of half patterns is used to form the companion moulds; or as is generally done, the two sets of half patterns may be fixed to opposite sides of the same plate. The advantages of this method are that a number of articles can be moulded simultaneously with great rapidity, and that the half patterns being firmly attached to the plates are lifted steadily from the moulds, and the latter are thus far more accurate than when each pattern has to be loosened and lifted out by hand in the ordinary way."

BESSEMER IN AMERICA.—"In addition to fifty millions of dollars invested in the old methods of producing malleable iron, five millions would scarcely cover the expenditure of the last five years in establishing the Bessemer manufacture, now conducted under thirteen different patents, of four different inventors, of whom two are Americans. These patents are used in four different States, with a present annual product of thirty to forty thousand tons. Other works are now building in the West, and within three years not less than ten millions of dollars will be invested and one hundred thousand tons of steel rails annually made."

—*Iron Age* Sept. 1.

LAMP LIGHTING BY ELECTRICITY.—The *Tribune* says a company is forming in New York to introduce Gardiner's apparatus for lighting the gas lights of the city simultaneously. The plan has proved a success at the Capitol in Washington. Small spirals of platinum, placed immediately over the jets, are heated to redness by a galvanic current, and the gas thereby ignited. The company proposes to turn the gas off and on by the same means, and to lay underground wires which will also serve for fire alarm purposes.

STEAM GUNS.—The London *Times* prints a communication from a firm which during the Crimean war offered to supply the Government with steam guns capable of throwing shot of one ton weight a distance of five miles.

AERONAUTIC.—The Aeronautical Society of Great Britain proposes to raise by subscription an experimental fund, for the erection of a blower and suitable apparatus to investigate the relation between the velocity of air in motion and the pressure it produces on plane surfaces inclined at different angles to its direction of motion.

Scientific Progress.

HEAT DEVELOPED BY SOUND.—Dr. Warburg gives some notes upon this subject in the *Philosophical Magazine*.—Wm. Weber had pointed out that the resistance of the air would not account for the loss of motion in vibrating bodies, and that some specific difference in their structure independent of their density must be the cause of the great diversity in this respect exhibited by various substances. The author then proceeds to remark that some of the vis-viva being therefore consumed in interior work it is natural to suppose that it is there converted into heat. The amount of motion so converted into heat will be greatest in those bodies which like lead soonest cause the sound to fade away. The phenomenon of deadening produced when certain bodies are attached to sonorous ones, leads to a like conclusion. Thus a tube of lead attached to one of glass soon destroys the sound of the former, while a tube of steel or brass has very little effect. Hence it might be expected that more heat was produced in the lead than in the other material. Repeated experiments proved the truth of this conclusion with a variety of substances. * * The amount of heat in different bodies seemed to be in an inverse proportion to their rates of transmitting sonorous vibrations.

AMORPHOUS SILICA AS A PIGMENT.—The following is from the *Chemical News*:—"Dr. Reimann describes a series of experiments made with the view to apply amorphous silica (as obtained by precipitating a solution of so-called water-glass, silicate of soda or potassa, with an acid and collecting, washing and drying the precipitate in the ordinary way) for absorbing the solutions of fuchsine, aniline blue, &c., and to apply the colored powder so prepared as a pigment for various materials. The author states that glass, first superficially acted upon by hydrofluoric acid, and next mordanted, as is usual for cotton, assumes, when submitted to the processes in use for dyeing fibre, precisely similar colors as that fibre, and that this effect is caused by the amorphous silica contained in the glass and made active by the hydrofluoric acid."

NEW SALT FOR BATTERY USE.—The following is from *Nature*:

"M. Etévé, of Paris, has taken a patent for the composition of a salt for the production of very intense currents of electricity which he calls double acetate of iron and potash. The nitric acid is replaced by a salt composed of one part of sulphate of iron and one part of nitrate of potash dissolved in a sufficient quantity of the acetic acid of commerce, the solution being aided by a slight heat, the whole is then left to cool and crystallise, and the crystals, after being drained, are stone dried. When the salt is thus prepared the pile is mounted in the following manner:—In the non-porous vessel is placed a saturated solution of common salt, and a zinc cylinder is introduced, within which is placed the porous vessel containing the charcoal, upon which is poured water containing 30 per cent of sulphuric acid. In this state the pile will not act, or in an almost insensible manner; but in order to develop the current it is only necessary to introduce a few crystals of the above-named double salt when the current becomes remarkably intense, if not superior to that of the common pile; the current may be maintained constantly and regularly without by merely adding a few crystals from time to time and without any nitrous vapours being disengaged."

THE NEW TELESCOPE.—The telescope for the Naval Observatory at Washington, for which \$50,000 was appropriated at the last session of Congress, is contracted for with an eastern firm. Four years will be required to complete it. It is to have an object-glass of 26 inch aperture.

LATEST FROM THE YALE SCIENTIFIC EXPEDITION.—The *Courant* gives dates to Aug. 25th, and says:—"In Northern Colorado an extensive tertiary deposit was discovered, abounding in remains of letanotherium, rhinoceros and other extinct animals. This formation is identical with the *mauvaises terres* deposit of Dakota, and evidently forms the south-western border of some ancient fresh-water lake. These beds were then traced northward through Nebraska and along the North Platte River, where they form the range from Chimney Rock to Scott's Bluffs. Several thousand specimens of fossil remains were collected, and among them a number of new species of mammals."

AMERICAN ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE.—The nineteenth annual meeting was held at Troy, N. Y., from Aug. 17th to 25th. We make the following notes from a report in the *Journal of Applied Chemistry*:

Prof. T. Sterry Hunt read a paper on Granitic Rock. He said that Rocks commonly called granite were mostly gneisses and stratified rock, while true granite was not stratified, but intrusive or irruptive, like traps and lavas. He divides granite, so called, into three kinds: 1. The indigenous, granitoid, gneisses; 2. Erosive, intrusive granites; 3. Endogenous, veined granite; all produced under different conditions. In veined granite are frequently found some of the rarer minerals, as lepidolite, tourmaline, &c., which are not found in granitoid gneisses.

Prof. Hunt read another paper "on the Oil-bearing Limestone of Chicago." His opinion was that petroleum is indigenous to certain limestone, not entering into them by slow distillation from neighboring schists. Those schists have not been subjected to great heat, and the petroleum limestones lie often below schists. The oil is usually found in patches and bands, there being strata both above and below containing no oil. The oil is hermetically sealed in the pores of the limestone. It escapes only on lines of disturbance, and then accumulates in fissures or between over-lying strata. Mr. Newberry, of Ohio, in reply, said that the stratified bituminous shales that so abounded with the paleozoic rock, in the West, also hold oil and yield it in many places. While Prof. Hunt considered heat a necessary condition of the separation of oil from the bituminous rocks, Mr. Newberry held that this was not essential.

Prof. C. H. Hitchcock presented an argument to prove that a large portion of the North American Continent had been submerged beneath the ocean since the Drift Period; based upon the existence of twenty-seven species of maritime plants in the interior along the great lakes. These were specified by name and locality, extending up the Hudson River and Champlain Valley and the lakes of Ontario and Erie to Minnesota. He argued that these plants were originally introduced by natural emigration along an ancient estuary. He supposed that the plants about the salt springs in Northern New York were introduced in the same way. The pre-glacial flora has been completely destroyed by the intense cold, and while a new creation might explain the existence of salt water plants about the springs, it would not show why they should exist in the far interior. There should be a special fitness of species to conditions, in case the creation theory is invoked. He concluded that the continent must have been submerged two or three hundred feet lower than geologists had supposed, and that the clays about Superior and Erie must have been of marine or estuary origin. It was quite unexpected that the present distribution of plants should throw so much light upon geological questions, and therefore it was urged that botanists shall faithfully preserve the localities of all their specimens.

CRETACEOUS EPOCH CONTINUOUS.—Prof. W. B. Carpenter, in a communication to *Nature*, gives to Prof. Wyville Thomson the credit of the doctrine that the formation of chalk has been going on continuously over some part of the North Atlantic seabed from the cretaceous epoch to the present time; and that we may therefore be said to be "still living in that epoch." We quote:—"The similarity of the globigerina mud, at present in process of formation, to the mesozoic chalk, had been recognized by various microscopists who had studied both—ss Ehrenberg, Bailey, Williamson, Huxley, Wallich and Sorby. But no one, so far as I am aware, had ventured to advocate the *unbroken continuity* of the chalk formation throughout the Tertiary and Quaternary periods, until it was pointed out by Prof. Wyville Thomson that there is no adequate evidence of its ever having ceased, though its locality has changed. This doctrine has received most striking confirmation from the discovery of the persistence of numerous cretaceous types, more or less modified, not merely in our own explorations, but in those carried on by the United States Coast Survey in the Gulf of Mexico."

FLIGHT OF BIRDS AND INSECTS.—*Cosmos* says that M. Marey has determined, by ingenious mechanical appliances, the fact that in birds, when flying, the extremity of the wing describes a simple helix, but in insects, a lemniscate, or figure eight.

Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

California.

ALPINE COUNTY.

TARSHISH.—*Miner*, Sept. 3d: Developments in the tunnel of the Schenectady Co. seem to be satisfactory. The fact is known that the lode as struck below is rich.

MONITOR No. 3.—In the east drift developments made this morning are considered of much importance and very encouraging.

EXCEQUER.—*Chronicle*, 3d: The Chalmer Bro. have removed from Bulliona, and will at once put the quartz mill in order for work next Spring; in the meantime some ore will be crushed.

BUTTE COUNTY.

SPRING VALLEY Co.—*Oroville Record*, Sept. 10th: Work on the ditch progresses. The iron pipe has been received here, and all but 60 or 70 pieces transported to the line of the canal. The work of laying it has commenced. It will all be on the ground within four or five weeks.

CALAVERAS COUNTY.

WEST POINT.—*Chronicle*, 10th: Reed's river claim, North Fork of the Mokelumne, use, giant powder in blasting large boulders. One charge often does as much as two of black powder.

INDEPENDENCE.—*Cor.* of the same: At Lewis Bro. mine everything is progressing favorably. At Lefoy mine, they are still sinking. The ledge continues fair. In the Piute a track has been laid the entire length of the tunnel. They have a ledge thirty inches wide, which will pay \$30 to \$40 per ton. At Big Flat, hydraulic mining is still carried on. Water generally continues abundant only until the first of August. Skull Flat, north of West Point two miles, is the quartz section. In and around the Flat there are a number of veins paying from five to fifteen dollars per cargo of 300 pounds. The Zactara has been idle for some time. Morse & Doyle are crushing rock at Thoss' mill which is expected to show the best clean up of any. The Lone Star is not being worked. The Bright & Appel, near the Star, is Thoss' mill, on the South Fork, is furnished with a 24-foot water wheel. It has two arastras, ten feet in diameter, and a rock crusher of Stanton & Hodge's patent, capable of pulverizing the hardest rock at the rate of ten tons per day.

INYO COUNTY.

CERRO GORDO.—*Independent*, Sept. 5th: The smelting works of M. W. Belshaw on the 1st of August resumed operations and will be kept in blast a long time. From the 1st to the 31st there were run out 2,744 bars of bullion of the average weight of 87 pounds, aggregating 238,728 lbs. The furnace is now pouring out silver lead bars at the rate of 4½ tons per day.

BULLION.—*Kearsarge*.—The shipment of fine bullion last week was 8,760 ounces.

KERN COUNTY.

A Los Angeles telegram of Sept. 12th says:—Three quartz mills are now running at Havilah. The "Joe Walker" is again being worked.

LASSEN COUNTY.

The *Sage Brush* of Aug. 27th has the following in regard to the new mine near Big Valley:—"Mr. Harrie reports that the pay is as good as at first. Four or five men with rockers had taken out in one day \$999." The *Yreka Journal* of 7th says:—"H. J. Ehlers, just from the new diggings, near Big Valley, says he washed out \$600 with a rocker, cleaned and weighed it, inside of three hours. The tailings from the claim, consisting of small pieces of quartz rock, were pounded out by prospectors who realized 33 per cent. Ehlers & Co. now save all their tailings to work over again."

MARIPOSA COUNTY.

MARIPOSA MINE.—*Gazette*, 9th:—The rock now being crushed is better than ever. **BENTON MILLS.**—The Co. have carpenters employed preparing timbers for a 30-stamp mill. They have contracted for 100,000 feet of lumber. At present there are 500 tons of quartz at the river, and the Josephine and Pine Tree mines never looked better.

COPPERVILLE.—*Inte* the Melvina G. Douglass has a vein eight to twelve feet in thickness, the rock averaging \$25 per ton.

NEVADA COUNTY.

LITTLE YORK WATER Co.—*Gazette*, 10th: The Co. are negotiating the sale of their property to a San Francisco company for \$125,000. We learn that they made a heavy clean-up a few days ago.

STARTUP UP.—The new 10-stamp mill at the Fidelity mine, above Washington on the Yuba, commenced crushing yesterday.

GOOD PAY.—A pan of dirt, in the claims of Kress & Co., at Orleans Flat, yielded fifty dollars' worth of dust. The claims have been considered nearly exhausted.

NORTH BLOOMFIELD.—*Transcript*, 8th: The ditch of the Gravel Co. was completed so that the water was turned in at Bowman's on Saturday. The ditch has a capacity of 3,000 inches from Bowman's to North Bloomfield, and 1,000 thence to Columbia Hill.

ORLEANS LEDGE.—Same of 9th: The Consolidated Co. have determined to erect hoisting and pumping works on their ledge, Gold Flat.

ORLEANS FLAT.—Same of 11th: The old claims are being reopened with excellent prospects. Kleese & Wells commenced last spring on a set of claims that have been idle for twelve years, and recently in cleaning up the bed rock have taken out fifty dollars to the pan. Johnson & Olsen have opened claims near by, and have made one good run. There has been no work done at Orleans Flat for eight years, every one supposing the ground was worked out. They are now working deeper in the hill. Brody & Rutherford, who have been putting up a mill to work the Metropolitan ledge, will have it in operation in two weeks.

POCKETS.—Hensley & Atwood struck a pocket in a small quartz vein on Red Hill, one day last week, from which they took \$140. On Thursday, Mr. Campbell found a pocket on Rush Creek, from which he took \$40.

RANDOLPH RIDGE.—*Grass Valley Union*, 7th: Webster & Co. are running over what seems to be a regular channel, and will sink down in a few days to the bottom to test the deposit. In the Picayune's ground the gravel prospects as high as 50 cents to the pan.

COSTLY.—Same, of 9th: The North Bloomfield Co. have spent \$850,000 in developing their mines and in constructing ditches.

PLUMAS COUNTY.

EAST BRANCH.—*Cor.* of Quincy National, Sept. 10th: Riddle & Co., on Soda Bar, are after the hack channel. They are running an incline, with an overshot wheel to hoist the cars, and another to run the pump, and all works like a charm. The Chinamen near Kingsbury's have completed their ditch, at a cost of \$5,000. This opens up a large scope of ground which, heretofore, has been worked with rockers, and paid well. Another ditch is on the tapis, that promises to be "the thing." It is to take the water of Spanish Creek, at the falls, and convey it to the big bars near the mouth of Black Hawk, and in time to Hardsack Joint, which will pay an ounce per day to the man.

EUREKA.—We are informed that the Eureka mine at Jamison is paying more largely this summer than ever before.

PLACER COUNTY.

GOON.—*Herald*, 10th: Miller, Nichols and Manuel have been prospecting a quartz lead between town and Baltimore ravine, and a few days ago had twenty tons milled which yielded twenty-nine ounces gold, or \$20 to the ton. This contained none of the specimens from the shaft. They have now gone to work systematically on the ledge.

COLFAX.—*Cor.* of same: The Rising Sun mill crushed two and a half tons of rock from Emigrant Gap, which yielded \$14 per ton in free gold. The sulphurets are rich but have not yet been worked. The first load of the Montana machinery will arrive to-day.

SAN BERNARDINO COUNTY.

CLARK DISTRICT.—Los Angeles telegram, 13th: The Piute Mining Co., of San Francisco, is opening a number of new ledges in Clark District. Machinery for mills will be shipped via Anaheim. Miners from White Pine are flocking in. The Indians are friendly.

SAN DIEGO COUNTY.

JULIAN DISTRICT.—*Cor.* of *Bulletin*: The Stonewall Jackson mine, ten miles from Julian City, has a new stamp mill, and the owners expect big things. They have purchased 1,000 acres from the Cuyamaca Co. and think they are secure.

Telegram, 9th: Reports from Julian say new and very rich discoveries have been made four miles east. Several very rich ledges have been discovered two miles west; one ledge, 1½ feet in width, with the surface showing gold to the naked eye. A stampede has ensued from Julian.

JULIAN, 13th: Last evening the citizens of Julian and Branson Cities celebrated the recent discoveries. There is more news of leads having been struck in San Felipe cañon, three and a half miles from Julian. The ledges are two to ten feet wide at the surface. Specimens show

free gold on every side. Another ledge has been discovered near the Helvetia. No estimate can be made of the riches of these discoveries. Last week the Owen's mine cleared up one hundred tons which paid \$24.47 per ton. The Van Worth cleared up twenty-four tons which paid \$20 per ton. The Cotton Mill is running on 200 tons from the California. Two men at work on the California mine, take out three tons of ore per day, which pays \$30 per ton.

SIERRA COUNTY.

GIBSONVILLE.—*Cor.* of *Butte Record*, 10th: After two years spent in opening, Tabor has found pay gravel in his claim, and is raising an air shaft. The Union claim, at Mount Pleasant, has found a good prospect, four thousand feet back in the red mountain-gravel, and a good prospect also in the front ground.

ITEMS.—*Messenger*, 10th. Wm. Manson and Harry Rosewarren have over three fourths of the Independence mine.... North America Claims at Hepsidam are now in a flourishing condition.... Jas. Olin is putting up hoisting works at Wolf creek mine.... George Hardy while mining near his ranch on the South Fork on Friday, struck a nugget of gold weighing \$52.... At Howland Flat, the Union Co. employ seventy men; the Monumental, forty; the Pittsburgh, eighteen. The Hawkeye is not working as many men as usual on account of a cave.

SISKIYOU COUNTY.

SCOTT VALLEY.—*Yreka Journal*, 7th: J. O. Welch has purchased the French Creek Ditch, and a large interest in quartz, and will place a mill on the ledge. The miners on East Fork and about Evansville, are making preparations in anticipation of a good supply of water this coming winter.... The Chinese cleaned up some flumes on South Fork on Friday, and were next day all driven from the neighborhood by the white miners in a body.... Trimble & Co., of Oro Fino, are to commence work on their ledge in a few days, and will start the mill again. Their ledge averages from the top down, \$11 per ton.

The quartz now being crushed at the Norfolk and Lodi mill, at Cottonwood, is yielding \$50 to the ton.

TRINITY COUNTY.

ITEMS.—*Journal*, 10th: Wm. McCullum is digging a ditch from Currie's creek to his claim on Cox's Bar, four feet wide and capable of carrying two thousand inches.... H. C. Wilt proposes digging a ditch to take water from Canyon creek to his claim on Pack's Bar.... H. E. Willey and another are to prospect the Ludwig quartz ledge on the East Fork.... The undivided one-half of the Osgood & Carson claims, sold at auction Saturday, was purchased by Peter Hansen for \$700.

TUOLUMNE COUNTY.

GOLD LEFT YET.—*Sonora Democrat*, 10th: Last week, John Anderson took out of his claim on Curtis' Creek, alone, in a day and a half, nearly three thousand dollars. M. Brown took from his claim on Wood's Creek, nine hundred dollars.

Nevada.

COPE DISTRICT.

TREASURE.—*Elko Chronicle*, 8th: Last semi-weekly shipment per W. F. & Co., from Cope, was \$2,500.

ESMERALDA.

DUNDERBERG.—*Carson Appeal*, 7th: There are some 30 men now employed in mine and mill. Same of 9th gives some assays of the ore. The average is \$225 per ton.

HUMBOLDT.

OREANA.—*Cor.* of *Register*, 10th: Strout stopped his furnace for want of coal. He shipped 30 tons of metal, and has 8 tons on hand. Drake, of the Montezuma, stopped work from same cause. He recently shipped 20 tons of metal, the result of eight days run, and has gone below to dispose of it. The Batavia Co., on the Rochester ledge, shipped three tons ore last week for a test. Thos. Harris is getting out good ore from his ledge near the Batavia.

RAILROAD.—*Elko Chronicle*, 11th: The Ballion mine has 125 tons ore out. The Webfoot resumed work on Monday. The main shaft is in a body of rich ore. Tripoli has 70 tons on dump. Last Chance No. 2 has out fifty tons. The shaft is twenty-five feet deep. An offer of \$4,000 for the mine has been refused. Dalles is a well-defined ledge which assays high in silver. They are sacking ore for shipment. Red Jacket has twenty tons ore on dump.

The *Independent* says the Elko furnace will soon fire up on ore from the Dalles mine. At a depth of thirty feet the mine shows nineteen per cent. of lead and \$83 in silver. The vein is seven feet in width.

REESE RIVER.

BULLION.—*Revielle*, 8th: For the three days ending yesterday the Manhattan Co.

shipped to New York, 24 bars of bullion, weighing 2,198 pounds, and valued at \$35,888.

ELDORADO MINE.—Same of 8th says the machinery for this mine went forward yesterday to Silver Bend. This claim has produced several hundred thousand dollars in silver. There are now at the Manhattan mill seventy-five tons of Eldorado ore which will yield an average of \$200 per ton, besides two tons of selected ore which will yield \$1,000 per ton. This ore comes from a vein eight or nine feet wide. One of the Transylvanias is next in importance by reason of its development, as well as by the fact that it is to be aided by a mill furnished with the Stetefeldt furnaces. This mill is to be of the capacity of fifteen tons daily, and will be completed within sixty days. The Arizona is also producing ore; and several other mines in the neighborhood are yielding rich chloride ore.

MINERAL HILL.—*Elko Independent*, 7th: The late discoveries on the west slope bid fair to prove of great importance. The deposits struck into, contain the very purest chloride ore, of considerable bulk. The rush has made business lively. The new mill will be running in a few days.

WASHOE.

GOULD & CURRY.—*Gold Hill News*, 10th: Daily yield 100 to 110 tons, principally from the body recently developed at the D street level. From this two to ten tons of sack ore, yielding \$500 to \$2,000 per ton, are daily taken out.

YELLOW JACKET.—The section at the 800 and 900-foot levels continue to yield 200 tons of good ore.

IMPERIAL-EMPIRE.—The new shaft is down 1,290 feet, the deepest perpendicular shaft in the State. The sinking progresses favorably. The old upper Imperial still yields 40 tons of low-grade ore daily, averaging \$12 or \$15 per ton.

SAVAGE.—Yielding 40 tons per day of fair ore, all from the lowest level. The drift north to strike the body recently developed by the Gould & Curry reached it last night.

OPHIR.—Considerable good ore from the new streak in the north ground.

HALE & NOBACROSS.—The north winze below the seventh level, is down 25 feet in first-rate ore.

CROWN POINT.—Daily yield 40 tons of fair ore from the upper levels. The drift south at the \$1,100 foot level is in 25 feet, the face showing barren as yet.

BELCHER.—The work of opening the 420-foot level progresses well.

CHOLLAR-POROSS.—The Belvidere and other sections are looking fully as well as at last report.

OVERMAN.—Some very rich ore from the new development in the south portion of the 400-foot level, but it seems to lie in detached bunches.

SACRAMENTO AND MEREDITH.—The upper workings continue yielding excellently, showing some improvement; the mill runs steadily.

VIRGINIA CONSOLIDATED.—Water still interferes with progress somewhat at the 500-foot level drift from the new shaft. A few tons per day of good ore from the old upper mine.

CALEDONIA.—A body of superior ore was struck Tuesday in the south portion of the 200-foot level, which is already yielding handsomely.

SIERRA NEVADA.—Both mine and mill being run satisfactorily and yielding good returns.

OCCIDENTAL.—The new mill still running on good ore from the lower mine.

HOPE.—Daily yield 43 tons, averaging \$24 per ton, keeping both mills running.

ITEMS.—*Enterprise*, 11th: Mr. Phillips, who bought the old Phoenix mill at Silver City, at auction, is taking down the machinery. The ground under the floor has been washed up two or three times since 1861, but will pay again. One hundred pounds made a bar worth \$14. Some 75 tons of tailings will be obtained in the cleaning up.... The Bullion Co. is about taking out ore again.... The Sutro tunnel is in 1,516 feet, in very hard rock.

WHITE PINE.

REVIEW.—*News*, 11th: Our report this week shows a healthy condition. Miners are at work, their ores are marketable; nearly all the mills are in motion. The Matteson works are approaching completion. Another furnace is under way. The blast machinery is nearly completed, and the finished furnace is drying. The separating machinery is on its way from the East.

The bullion shipments amount to \$39,543.34.

ITEMS.—Daily Beecher runs north 300 ft. from the "Earl Chamber." Large body high-grade ore disclosed in it this week.

Fifteen tons per day raised. Average yield \$35 per ton....Original Treasure shows good ore on dump, but its extent is not known to outsiders. There has been a change of Supt. and Foreman....Silver Wave shaft down 58 feet, and very rich ore taken from the drifts....Considerable good ore from Silver Wedge.... Burning Moscow is turning out some very rich chloride ore; small lots of 5 or 6 tons gave \$72 to \$250 per ton....Aurora Consolidated and Eberhardt, belonging to the English Co. are still a 'sealed book' to the outside world. The street is full of rumors.... Jack Ober & Co. get daily 20 tons ore worth \$800 per ton, from the Calico mine in Secret Canyon, Lander county. The ledge is 40 feet wide....Handerson mill was to start on the 8th. Bowie & Brown mine have leased it.

OUTSIDE DISTRICTS.—The mill at Reveille is to start about the 20th....On the 6th, came by stage from Pioche, 14 bars of bullion, weighing 1,599 pounds, valued at \$17,698.75.

STARTED.—A Hamilton telegram of 12th says: "Matteson's furnace started this morning, and has already turned out seven tons bullion."

MINING ON A GRAND SCALE.—Elko Independent, Sept. 7th: The English capitalists who purchased the Eberhardt and other properties in White Pine, are embarking in business on a mammoth scale. The lumber for the mill and buildings, loaded thirty-four cars, while the machinery amounts to about two hundred tons.

EUREKA.—Sentinel, 10th: Full reports, all favorable. Shipments of bullion during the week are: Consolidated Co. 43 tons and 137 pounds, which assayed \$350 per ton; Collier Robbins, 20 tons, assay value \$450 per ton; Jackson Company, 22 tons, assay value \$350 per ton.

One thousand pounds Paige & Corwin ore worked at the Manhattan mill, gave \$1,100.

Spring Valley ore from the Reeves and Berry mine gave \$77 per ton without roasting, at the Smoky mill.

Arizona.

ITEMS.—Prescott Miner, Aug. 27th: McCrackin & Co., discoverers of the Del Pasco, worked one month two astras, and brought to town gold \$1,900. The claim is near the summit of Bradshaw mountain. Several other claims are located.

LYNX CREEK.—Uncle Billy Pointer is crushing better ore than ever before. C. Y. Shelton is in 100 feet on the Vernon, and getting splendid rock....Alex. Harris, with two men, working for the Bashford Co., five days on Lynx Creek, brought in ten and one-half ounces.... Jackson & Lovejoy, on their hydraulic claims on Lower Lynx Creek, put in five days' work with three hands, and three nights with two hands, and cleaned thirty-one ounces.... Evans & Co. have struck it rich. They got \$1.70 to three pans of dirt.

BIG BUD.—C. T. Rogers reports water plenty, the mill running steadily, a good clean-up this week and everything lovely.

HASSAYAMPA.—Duff & Kelly got water for a five days' run, and took out a little over a pond of dust, some chispaa in the lot weighing from \$2.50 to \$12 and \$14 each.

STERLING.—Same, of Sept. 3d, says the mill started up on Monday. Everything worked well. No attempt will be made at present to work the sulphurets.

Idaho.

ITEMS.—Avalanche, 3d: They have struck it richer than ever in the Ida Elmore mine, 80 feet below the fifth level.... The Comos mill has started up and will run regularly on Corduroy ore.... In the Wagon town diggings, a miners' meeting laid over the claims to July 1st, 1871. There are 300 Chinamen at work in the creek below and a number above. Tom Walls sold his race track claims for \$2,000.

SNAKE RIVER.—With one exception, the claims are all worked with rockers and pay from \$10 to \$20 to the hand. Capt. Bledsoe is working a string of sluices and making \$10 per day to the hand. It is now thought that the rock on each side the river is the source of the gold.

The Elko Independent of 10th says Johnny Hill has returned from Snake River, and calls it a bilk. He saw more rattlesnakes than gold.

A Corinne telegram of 12th says there is a stampede from Snake River to some new mine discovered 80 miles northeast of Corinne.

RICH STRIKE.—Avalanche, 10th: Catalow & Bailey are developing a mine on the east side of Jordan creek, named the "Blue Jacket." A shaft is down forty feet. The ledge is eighteen inches to two feet in

width. It is immensely rich in silver, mingled with which much free gold can be seen. We are informed that samples have assayed \$2,000 to \$5,000 per ton.

LOON CREEK.—Statesman, 3d: Miners are doing well. Boyd Varney & Co. can pan out two dollar prospects on the shovel. John Gray has his claim open. An eighty dollar nugget was found the other day.

ALTURAS COUNTY.—The Statesman of Aug. 20th, says the Monarch Co. have probably sold the Atlanta mine to a party of London capitalists. Captain Nancarrow, a mining expert sent out by the party, says that there is no such mine in Nevada as the Atlanta, and never has been, not excepting the Comstock. He went down in one shaft and pried up a piece of rock as large as a man could lift, which on breaking was found a solid mass of threads and shafts of silver. In the old Idaho mine, Ford & Co. lately took out twenty tons of ore which, worked in an arrastra, yielded \$4,300.

New Mexico.

CHESTER MILL CO.—Press and Telegraph, Sept. 3d: Affairs have been arranged, and the mill will soon start up again. Work has been progressing on the lode.

REO RIVER REGION.—Messrs. Floorman & Co., have erected a smelting furnace for testing, preparatory to more extensive works. We were shown several small buttons of silver and gold already taken out. The ore is supposed to run \$75 per ton.

THE BURRO MINES.—The Arizonian of Aug. 13th says: Mr. Power, superintendent of the Harpending Co., has set forty men to work upon the claims. Partisan from New Mexico as also from Tucson, are commencing operations in good earnest.

Montana.

A BRICK.—Helena Gazette, Sept. 5th: Messrs. Bohm & Co. cast one gold brick 2,282 ounces, coin value \$41,859.

It is computed that the yield of gold this season will be greatly in excess of last year.

IRON CLAD LODGE.—Saventine tons ore realized 50 ozs gold bullion. The shaft is 124 feet deep.

HORSE PRAIRIE.—Cor. of same: Jeff Davis Co. is at work; Merrill & Co. are on a bar making \$12 per day to the hand.

The next ground below is "\$10 diggins," the property of Mr. Hyde: Faaring & Co. are taking out an ounce per day to the hand. Mr. Cooper averages \$8. and Bonghardt & Co. own the lower claim, which is \$8 diggins.

PIKES PEAK.—New North West, Sept. 2d: The yield on Pilgrim Bar was up to average. Yesterday Catching, Kohrs & Co. cleaned up \$2,700; Beeroy & Co. \$2,000 from the sluicing of one head—the other not cleaned up, but will yield over \$2,000; Blair & Co. \$2,250. The remainder of the claims yielded from \$800 to \$1,000.

BOULDER.—From 75 to 100 men are working. Two main companies have been organized to run drain ditches. A prospect of 15 cents was taken from discovery. The general opinion is favorable to the camp. Nesbitt, partner of Nasons, struck bed rock on a side gulch opposite discovery. There are four feet of loam, and three of gravel. All the gravel prospects good.

HIGHLAND.—Independent, 3d: The Nevins arrastra is running. The Only Chance Co. are cleaning up between \$5,000 and \$6,000 per week. The water in Basin gulch, is not yet sufficient to run the flumes. On Moose creek, Day & Harvey mill will get into operation next week. Mr. William Crisp sold a one-eighth interest in the Only Chance for \$6,000.

BEAVER CREEK.—A few companies are running drains and sinking shafts. Outside of a few claims near discovery, the ground is believed to be deep, as fourteen feet, no bed-rock has been reached.

Wyoming.

SWEETWATER.—The South Pass News of Aug. 24th says: There is more real labor now being performed upon our mines, and more gold being actually produced than ever before."

A GOOD IDEA.—The Folsom Telegraph says: Messrs. Eberhart & Luchman, have erected a spacious building on Poverty Ridge, near Sacramento, on the line of the S. V. R. R., with a side track running from the building, designed for a wine house and presses. The location is convenient and with little trouble and at low prices they can obtain all the grapes from the foothills by rail, that they may require. The location of wine houses on the line of our railroads, when large supplies may be obtained at a small cost for freight will render valuable many vineyards, which are now unproductive for want of a market.

San Francisco Stock Market Review.

THURSDAY EVENING, Sept. 15, 1870.

We notice that a larger number of stocks were upon the market during the past week than for some time past, embracing a goodly share of what we call outside stocks, as distinctive from the claims located on the Comstock lode, which usually comprise the bulk of the Board transactions. An improvement in prices is a rather noticeable feature of the market; however, a lessened degree of firmness is observable at the close in a few leading descriptions.

CHOLLAR POTASSI—has been in good demand at a smart advance. During the week closing Sept. 10th, they extracted 1,600 tons of ore, showing an average value of \$74 20 per ton. All the faces of the ore-producing localities continue to look well. Received \$19,570 in bullion.

GOULD & CURRY—changed hands to a considerable extent, realizing an improved price over opening rates. For the week ending Sept. 12th, the following amount of ore was taken from the mine: 1st class, Potosi, 17½ tons, the assay value of which is given at \$742 46 per ton; 2d class, Potosi, 500½ tons, valued at \$79 46, and 2d class, from other localities, 140 tons, valued at \$43 45 per ton. No favorable results have yet been obtained from further prospecting, which is vigorously continued.

HALE & NORCROSS—sold to a limited extent at slightly fluctuating rates. The bullion returns for the month of August aggregate \$149,328, against \$200,863 in July. The ore extracted for the week ending Sept. 10th amounted to 1,146½ tons, as follows: 175 level, 41½; 300 level, 194; and seventh station level, 910½ tons. They have in the dumps, 5,745 tons.

IMPERIAL—seems to give better promise of good results in the future; few sales are now transpiring. On the 13th inst. they started a winze in the centre of the Alta mine to connect the 1,200 and 1,300 levels. This winze is made for ventilating purposes, as it is the intention to thoroughly prospect on the 1,300 level. The bottom of the shaft carries lively quartz, with the exception of a vein of porphyry about a foot in width. They are now extracting about fifty tons of ore per day from the old works.

CROWN POINT—was in the market to a moderate extent. On the 11th inst. the incline had attained a depth of 41 feet below the 1,100 level, the material they are running in consisting of hard barren quartz and porphyry. The south drift is in some sixty feet, and the face is reported to show some favorable looking quartz. It is the intention to make cross-cuts at intervals of 100 feet until the south boundary is reached. Bullion returns for August, \$16,475.

—BELCHER is dull of sale. They have stopped work on the 730 level, and are now prospecting on the 152, 200, and 420 levels. —OPHIR met with free sales. An assessment of \$3 per share was levied on the 9th inst. —SIERRA NEVADA has been in good demand at an advance. A dividend of 50 cents per share is payable since the 16th. —GOLD HILL QUARTZ levied an assessment of \$10 per share on the 8th inst. —IDA ELLMORE (Idaho) levied an assessment of \$5 per share on the 10th inst.

SAGE—was in the market to a very large extent, selling at an improved price. The prospects from their lower developments are more encouraging of late. From the winze now being sunk from the 8th level, extending to the Hale & Norcross lower level, it is the "intention to run north to connect with drift from shaft, also to drift south to Hale & Norcross line. A drift has been run on D street level to reach what is called the north Potosi body of ore, and by this drift have made connection with Gould & Curry works, and have found a very good body of ore lying next the line which promises well. In a few days they will be able to take out from this quarter 30 to 50 tons of ore daily, which, according to assays already made, will mill \$30 to \$50 per ton."

MINING STOCK QUOTATIONS, SEPTEMBER 13, 1870.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

Traveling Agents.

WM. H. MURRAY—Montana, and Utah.
S. H. HERRING—California.
J. M. WOLF—Oregon.
L. P. MCCARTY—California.
L. MINER—Nevada, and Colorado.

Resident Agents.

CENTREVILLE, Alameda Co., Cal.—L. G. Yates.
OAKLAND—W. H. Hardy.
SACRAMENTO—A. S. Hopkins, No. 70 J street.
JACKSON, Amador Co., Cal.—J. S. Andrews.
TREASURE CITY, Nev.—J. L. Robertson.
HAMILTON, Nev.—Thomas Starr.
CARSON CITY, Nev.—John G. Fox.
SHELMANTOWN, Nev.—P. C. Renfrew.
BOISE CITY, Idaho—Lankin Bros.
HELENA, Montana—E. W. Carpenter.
EL PASO, Texas—Harper M. Orshead.
CENTRAL CITY, Col.—Richards & Crane.
GEORGETOWN, C. T.—John A. Lafferty, Postmaster.
DENVER CITY, C. T.—Woodworth & Moffat.
CHEYENNE, D. T.—Robert Beers.
OMAHA, N. T.—Barlow & Brothers.
PHILADELPHIA, Pa.—Piller, Quigg & Co.
LOANES—George Street, Richmond, E. O.
HUNSON & MEYER, 41 Park Row, New York.
NEW YORK—H. D. Dumont, 73 and 75 Fulton street.
A. C. KNOX, City Soliciting and Collecting Agent.

Mining Shareholders' Directory—Meetings, Assessments and Dividends.

[Compiled weekly from advertisements in the SCIENTIFIC PRESS and other San Francisco journals.]

CROPS IN SONOMA.—A correspondent of the Petaluma Journal thinks that the present year's yield of serials in Sonoma county, is but little below the average, while that of the vine and other fruits is equal, if not greater.

HOPS FOR EUROPE.—Two car loads of hops, raised by Capt. W. M. Haynie, near Sacramento, left by rail, a few days since, en route to London, England, the first foreign shipment of this article yet made, we believe.

A MODEL OF THE WHITE MOUNTAINS.—Prof. Hitchcock and class, from the Chandler Scientific School, are making important discoveries in relation to the geological structure of the mountains, and the extent of the ice in the glacier period. They will soon construct a model of the mountains—the first attempt of the kind in the country.—College Courier.

THE SCIENTIFIC PRESS devoted to mining, farming and the mechanic arts, and is inferior to no publication of the kind in the United States.—Owyhee Avalanche.

THE SCIENTIFIC PRESS is one of the most interesting of our Exchanges, and is especially devoted to giving full accounts of mines and all new inventions and improvements in mining machinery, and machinery of all kinds. It also contains a general review of mining operations in all parts of the United States, with an epitome of the latest mining news, selected from the local papers of each district. All very interesting to miners and mechanists.—Helena Gazette.

NEW VOLUME.—The San Francisco SCIENTIFIC PRESS has entered its 21st volume, and is one of the most valuable journals published. Containing, as it does, articles on every branch of home industry, the sciences, arts, etc., the Press should find its way into every hamlet in the land. The four dollars expended for a year's subscription to this journal may be repaid by the information gained by the perusal of only one number.—Alpine Chronicle.

THE SCIENTIFIC PRESS.—An illustrated Pacific States weekly, devoted to mining, farming, mechanic arts and industrial progress, generally, but especially in the west. This work is published in San Francisco, at 24 Pacific street. Mr. Asa Lee is canvasser for subscribers, with specimens of the work, which we can commend to our readers—the general public.—Deseret Daily News, Salt Lake.

Farming and Gardening.

Communications for this department are solicited from all parts of the Pacific States and Territories.

Profits of Forest Culture.

From what we said on this subject two weeks ago, it will be observed that in the system of forest culture there marked out, there are four harvest periods, at intervals of six years between each, or 24 years for the entire term—the aggregate of the returns from which ought to reach fully \$9,000, or a full average of \$375 per acre, for each year during which the forest has been growing; while there will still be left upon the soil at the end of that time, 300 trees, that ought to be worth, something about \$2,000, for timber alone, which may be considered the then value of the land. If the 300 trees thus left are English or black walnut or pecan nuts, the annual yield of fruit from each tree, from thence onward for the next 50 years or more, ought to be at least \$10, or an aggregate of \$300 per annum, per acre, for the mere trouble of gathering the nuts; while the trees will at the same time be making a slow growth (slower, of course than non-bearing trees) until they reach a value of at least \$3,000 per acre for timber.

In order that there may be no mistake about these figures, and to give each one an opportunity to see how we have arrived at the above results, we will recapitulate, premising that we are supposing our artificial forest has been placed in close proximity to water or railroad communication, and not in the distant redwood or other mountains, where transportation forms the chief item of cost.

For reasons given in the previous article, to secure a more ready and vigorous start, we commence with close planting—about three feet apart, or 4,900 trees to the acre. At the end of the first period we shall have 2,300 saplings suitable for poles, stakes, etc., and a few large enough for fence posts, besides much that will be left for fuel. The whole, being just where it is needed, will be worth to the farmer himself or his neighbors, we may say \$175.

The second period, or season of income, at the end of 12 years, would give us 1,150 trees from which could be obtained at least 1,000 railroad ties, worth 40 cents each net, which, with the fence posts, poles and fuel, would bring the receipts up to fully \$525—and very probably six or seven hundred dollars, if we take into account the quality of the timber. Timber of the size now produced would be large enough for sawing up into staves, for which it might be worth more than for any other purpose.

The third period (18 years,) will give us 573 trees which will average 18 to 20 inches in diameter, and from 60 to 70 feet high. The timber now obtained will be suitable for the saw mill or small spars. Each tree ought to furnish at least 350 feet of the best hardwood lumber, which would be worth on the ground, \$16 per M.; or \$3,200 for the entire lot. In addition to the lumber, the lot ought to furnish 860 railroad ties worth \$344, and fence posts and fuel worth \$100, or \$3,644 in all. We have now an average annual product from the time of planting (18 years) of \$241 per acre.

The fourth period will give us the same number of trees, but now, by increased growth yielding 500 feet each, or 277 M. in all, worth \$4,432, besides ties, posts and fuel worth \$444; aggregating for the last six year period \$812 per year.

If we aggregate the receipts for the entire period of 24 years, we have a total of \$9,220, to which must be added the value of the trees still remaining, say \$2,000, making a grand total of 11,220 or a yearly average of \$467, for a single acre of land, with no more labor than would have been required to cultivate the same with corn.

Large as this account is, we can see no

reason for deducting from the figures we have made, except for loss by fire, which might be insured against for a small per centage. The casualties which might arise from the failure of trees to grow would be very small, and would be confined to the first three years at farthest; moreover, new ones would of course be supplied from the nursery to make the original number good. It is barely possible we may have overstated the growth a little; but it would be difficult to show such a result from figures based on any actual experience in growing trees in this State.

We may here add as an instance of the rapid growth of forest trees in California, the fact recently stated by the *Colusa Sun*, that a cottonwood tree which was planted in that town in 1855, was cut down the present year—at 15 years of age—and yielded seven cords of wood! Cotton woods in Sacramento have attained a height of 40 feet, and a diameter of 20 inches in 10 years. These cottonwood trees make poor timber or fuel; but they do not grow much faster than either the locust or larch, both of which make the best of timber.

We may also add to the above the fact that the President of the Council Bluffs (Iowa) Agricultural Society is now living in a house, the lumber of which was made from timber of his own planting, which was cut at 15 years from the time seed was put in the ground. California ought certainly to do as well as Iowa or any other State.

In the above calculations we have confined our product to timber alone. If we were to mix with our timber, a few nut trees, we should greatly increase the receipts after the sixth year from the sale of nuts, as has already been shown.

The man who plants an acre or any considerable number of forest trees at the birth of a son, as many do in Europe, may have as the product of that acre or less, a handsome fortune or start for his boy when he attains his majority, and at the same time fully reimbursed himself for the original cost of land, interest upon the same for 21 years, and principal and interest for all the labor expended thereupon. There is scarcely a man in California, owning a farm, who cannot plant with trees one acre every year or period of two or three years, without interfering with his income or other farm work; as all the work of planting and caring for the same can be done during leisure days and weeks of the year.

Value of Larch for Timber.

One word with regard to the usefulness of the larch for lumber. It is but little inclined to shrink or crack, and is odorless, which latter quality especially renders it extremely valuable as timber for wine and other casks, a suitable wood for which is greatly needed in the State, and for which the demand must constantly increase. It is also very valuable for cabinet work. Larch fence posts are said to stand for fully 20 years; while for grapevine and other stakes, it is said to have been known to do duty in Switzerland and Germany for two full generations. There are said to be larch piles now standing in the London docks, and in good condition, which were driven a thousand years ago!

A Valuable Larch Forest in Scotland.

Artificial forests, chiefly of larch, are quite common in various parts of Europe, where many landowners derive their chief incomes from such investments. The larch will flourish in the poorest soil. The Duke of Athol, in Scotland, has a larch plantation of some 10,000 acres, set out on what was formerly a barren mountain tract, utterly worthless for cultivation. This plantation was started by his ancestor in 1730 as an experiment, and when experience had proved its success, the planting was continued for a number of years until the entire tract was covered. The trees were planted thickly at first, much as we have shown above, and gradually thinned out. At 20 years of age they are found to attain a size available for a great variety of uses, and at 70 they are fit for the largest ship timber. Such timber averages about 300 trees to the acre, and its value in the forest is estimated at half its value in the nearest ship yard. The value of this entire forest, as it now stands is set down at \$32,000,000. If a young man in California had 10,000 acres planted out in a young forest, he might, if he should live to reach eighty years of age, be able to leave to his heirs a similar fortune, at less than a quarter the cost that would be required to build up such a fortune in any other manner. Moreover, in this case the result would be absolutely certain; while in mercantile or speculative pursuits the chances would be

more than ten to one against acquiring a moderate fortune. If he died at an earlier age, and before his work was fully done, the foundation of such a fortune would remain, and its value be counted by the number of years which he had lived.

Who would not rather leave to posterity one thousand trees, than one thousand dollars, though they were might be saplings? Living groves are better than decaying mansions. The former are growing monuments, which may flourish and wave, and feed ones descendants for centuries after a marble monument may have crumbled to dust.

The Exhibition Awards.

California Wines.

The Committee appointed to inspect the exhibits of California wines and liquors at the late fair, and report as to their comparative qualities and merits, submitted the result of their labors on Thursday evening as follows:

WHITE WINE.

United Anaheim Wine Growers' Association, best white wine of 1869.

Orleans Hill Vinicultural Association, best white wine of 1869 (equally as good as the above, but foreign grape).

Lake Vineyard, of Los Angeles, best white wine of 1868.

O. W. Craig (H. D. Dunn, Agent), best white wine of 1867.

Jacob R. Snyder (Bowen Brothers, Agents), best white wine of 1866.

CLARET.

Migharracca, best red wine of 1863.

M. Keller, best red wine of 1868; also of 1867; also of 1866.

PORT.

Orleans Hill Vinicultural Association, best port wine of 1869.

Lake Vineyard of Los Angeles, best port wine of 1868; also of 1867.

SHERRY.

George West, best sherry wine of 1868; also of 1866.

CHAMBERTIN.

P. N. Bugby, best chambertin (foreign grape) of 1868.

ANGELICA.

M. Keller, best angelica.

BEST SPARKLING WINE.

First Premium—I. Landsberger & Co., muscatel.

Second Premium—I. Landsberger & Co., Private Cuvee.

Third Premium—I. Landsberger & Co. Dry Champagne.

Fourth Premium—J. Finke, sparkling wine.

BRANDY.

F. Schleifer & Co. best brandy of 1869.

M. Keller, best brandy of 1868; also of 1867; also of 1866.

MISCELLANEOUS WINES.

Eberhardt & Lachman, Cucumongo wine.

S. W. Shaw, Muscatel.

Eberhardt & Lachman, Muscat.

O. W. Craig, Malaga.

Lake Vineyard of Los Angeles, Sultana.

Orleans Hill Vinicultural Association, Resling of 1866 and 1869.

B. D. Wilson, bottle of fine old port (twelve years' old).

P. N. Bugby, for a variety of fancy brands of sweet wine.

BITTERS.

M. Keller, best wine bitters.

Eberhardt & Lachman, best cocktail bitters.

I. H. Wanser, best root bitters.

The committee recommended that diplomas be awarded to all of the above, for the reason that they have entered the best wines and liquors for competition.

Samples of sparkling wines, only were selected from stock in store for exhibition.

The committee further stated that they were unable to agree on the subject of awarding the grand prize, and asked for further time to submit a supplementary report as soon as they have arrived at a definite conclusion.

PERSIMMON TREES IN CALIFORNIA.—The *Sacramento Bee* says there is a persimmon tree, which has been in full bearing for several years at the northwest corner of Q and Third streets, Sacramento. It was planted by Col. Sanders fourteen years ago. The *Grass Valley Union*, in noticing the above, says: "And there are several trees at Threlke's ranch, between Auburn and Rattlesnake Bar, Placer county. Ten years ago, or more, the largest tree there bore fruit. Now, there is a large orchard of trees, and plenty of the fruit. The persimmon is not only a fine fruit, but the wood of the tree is the best out of which pulleys can be made." We have already noticed the fact that Mr. James Lick cultivates the persimmon on his ranch, near Santa Clara.

MICHIGAN BLUFFS.—Our correspondent, "L. P. Mc.," writes from Michizan Bluffs: "Some half dozen very fine little mountain ranches exist within a few miles of the Bluffs, from which the inhabitants, for ten or fifteen miles each way, are supplied with fruit and vegetables of the choicest kinds. The principal one is that owned by Mr. James Wills, one half mile from Michizan Bluffs. Mr. W. informs us that the late frosts killed nearly all the winter apples in this vicinity, which were in full bloom when the last frosts occurred; and the cabbages and turnips have all been destroyed by a plague of lice. The former of those vegetables commands 15 cents per pound in this market at the present time. Mr. Wills informs me that the grape vine does better here without irrigation than with; he says that if only planted deep (say 12 inches), no irrigation is necessary. He also gets a crop of grapes the first year from settings by a system of grafting."

It is impossible to obtain grapes from "settings" the first year; but old vines or roots, grafted, will often produce from one to six pounds each.

LICE ON CATTLE.—A correspondent of the *Country Gentleman*, for the purpose of killing lice on cattle, dissolved about a pint of strong soft soap in a pail of warm, soft water, and saturated the whole surface of a lousy cow with it; after thirty minutes, repeated the operation, and in thirty minutes longer, took a pail of clean warm water and quickly and thoroughly washed out all the soap, water and dead lice in large quantities, put her in a warm stable and covered her with a dry blanket. The next day, after being thoroughly dried, she looked and seemed to feel like a new animal; more than doubled her quantity of milk within twenty-four hours, and immediately commenced gaining flesh and general thriftiness.

PRECOCIOUS FRUIT PRODUCT.—The *San Diego Union* says that on the ranch of Mr. Russell, in Tia Juana Valley, San Diego county, "there are now ripe grapes on one year old cuttings, set out in January;" and that on the same ranch "figs have been grown from one year cuttings." Are we to understand from the above that grapes and figs are there obtained from cuttings the first year they are set out as cuttings, or that the cuttings were first rooted and then set out? The same paper further adds that "apple trees, three years old, are now bearing—one tree having one, another six and another seven apples."

TOBACCO IN SAN DIEGO.—Mr. Russell, a farmer, living in the Tia Juana Valley, according to the *San Diego Union*, planted three-quarters of an acre with tobacco, in May last, from which a magnificent crop of very superior quality was gathered a short time since. Encouraged by this success, Mr. Russell has determined to plant five acres the coming season.

SUGAR CANE.—An experimental lot of sugar cane planted by Mr. Thompson, near Suscol, is doing well.

There is said to be a "Corner" in the Peanut market, in Cincinnati. The crop was "short" last season, and a Cincinnati firm has been buying up all the peanuts that could be had, to make the "Corner," and run up the article to a "giddy" point. The firm claims to have 300,000 bushels in store, and the quantity still increasing.

WITHOUT IRRIGATION.—The *Gazette* of Nevada says:—We have alluded on several occasions to the statements of individuals that grape vines will thrive on our hill sides without irrigation, and within the last few days we have received further evidence of the fact that grape cuttings if well planted early in the spring will survive the drouth of summer. Messrs. Rolfe and Frink set out a thousand cuttings on the hill side two miles east of Nevada last March and April, and nine-tenths of them are growing finely. They have not received a drop of water by irrigation. The vines that have been kept the most free of weeds, and where the ground has been frequently stirred, have done the best. The ground where these cuttings were set out, was spaded to the depth of about eighteen inches. The vineyard is on the north side of a hill, which in a measure protects it from the heat of the sun.

The Late Horticultural Exhibition at the Mechanics' Institute.

[Concluded from page 199.]

ALAMEDA COUNTY was favored by the splendid exhibit of J. Luelling & Son, of San Lorenzo, who made the best general display at the fair. These gentlemen were the first nurserymen on the Pacific Coast, as well as the pioneer orchardists. They have 100 acres of orchards in Alameda County, and 150 in Napa, in the former of which they have 112,000 standard trees and plants growing.

The First Nursery on the Pacific Coast.

As early as 1846, W. H. Luelling brought a wagon load of assorted nursery stock across the plains, and started the first nursery and orchard, near Portland, Oregon.

In 1847, Wm. Meek brought a wagon load of trees and seeds by the same route, and settled in Lynn County, but subsequently removed to a locality near Portland. In 1848, Luelling & Meek joined in partnership. In 1849, Mr. J. Luelling arrived in Oregon, joined with the firm, and established branch nurseries in various parts of Oregon and in California. This partnership continued until 1856. The original orchard, planted by Luelling & Meek, is now standing.

The San Lorenzo Nurseries

Were started in 1852—Mr. Meek, the old partner, has an extensive farm and orchard, and a fine residence adjoining Luelling, in San Lorenzo. It was on Mr. Meek's farm that the Rainie plant, exhibited by Mr. J. French was grown. The San Lorenzo orchards and nurseries are as fine as any in the State, and several other orchards along the San Lorenzo might have exhibited with credit. J. Luelling & Son exhibited 125 varieties of fruit. These gentlemen have 3,000 Almond trees ready for market in their nursery, also 93,000 Cherry Currant plants, and several thousand Cherry trees. They have marketed this season, 120,000 lbs of currants; and 40,000 lbs of cherries.

They have 70,000 young Grape vines, of fine foreign varieties, just beginning to bear, which will produce 100 tons of fruit this season. Their place must be seen to be appreciated; all who carefully observed their display of fruit at the fair must have been much gratified.

Mr. W. Hunt of Oakland, exhibited some choice Norway Oats, and took a premium.

Mr. H. also exhibited some fine bunches of Grapes.

Oakland also gave the magnificent Century plant, which formed such an attractive feature. Gen. Kirkham, for his liberality, will long be remembered, by every admirer of this wonderful plant.

Although Alameda County is one of the garden spots of the State, and produces as fine specimens of vegetables and cereals as any part of the State, but few samples were on exhibition—why was this? Surely the management of this fair has been in strict accordance with the high reputation of the Mechanics' Institute, and no distrust could reasonably deter any one from participating, while every incentive of enterprise and competition has been open to all.

Santa Clara County,

Made a very creditable show of fruits. L. A. Gould exhibited about 120 varieties from his extensive and wonderful orchard, pronounced by the Wilder party, the *finest in the world*? One who rides through its numerous avenues cannot fail to admire the well arranged groves and collections of apples, pears, peaches, plums, cherries, grapes, nut trees, strawberries, etc., etc., all loaded with beautiful fruit, and under a most complete system of cultivation, and irrigated from an artesian well, the water of which is conducted in pipes to all parts of the orchard. Mr. Gould did not exhibit so much for a premium, as to encourage the enterprise and compare notes. He, like all good orchardists, is more interested getting a few of the best varieties, than in cultivating many indifferent sorts. He took two premiums; but showed more interest in the display of others than in that his own. B. F. Headen, of Santa Clara, a near

neighbor of Mr. Gould, also an orchardist, made a very good showing of fruit from his fine orchard. He took one premium for apples, and his plums, pears, etc., were very fine; indeed his whole display was creditable. He placed some unfermented juice of the grape on his table that was quite a novelty, but did not attract much attention, probably because the firoking had not taken possession with his glittering seductive poison. Both Mr. Gould and Mr. Headen exhibited some fine Catawba Grapes.

Mr. King, also of Santa Clara, made a very creditable showing of excellent fruits in variety. His place is irrigated by artesian wells.

Fox & Farney, of San Jose, exhibited a very large variety of apples, 43 kinds; pears, 50 varieties; plums, 26; strawberries, 5, besides other fruit. Their establishment was started, in San Jose, in 1854, by Mr. B. S. Fox. Mr. Mark Farney, planted a nursery in 1838, on a piece of land adjoining. In 1865 the two entered into partnership, and have been doing a large nursery business ever since. They cultivate a nursery of some 30 acres, while their orchards cover some 120 acres. Their nursery contains all the leading varieties of fruit trees. They are, this season, budding some 20,000 pears, 10,000 plums, 10,000 cherries, 6,000 peaches, 4,000 almonds, 4,000 apricots, 2,000 nectarines, besides large numbers of apples and other fruit trees.

Their place is on the banks of Coyote Creek, and is a light adobe soil. They grow all fruit, excepting strawberries, without irrigation.

Mr. J. M. Patterson, also of San Jose, who has a fine little orchard "among the willows," on alluvial soil that requires no irrigation, made a beautiful display of pears and blackberries, for both of which he took premiums. He also showed some fine specimens of other fruits. But his dried prunes, which constitute the chief attraction, were certainly very superior, especially the ones dried by hot air. Mr. P. makes the raising and drying of prunes a speciality.

From Napa Valley.

S. Wing, R. S. Thompson and A. Beaufreton, exhibited some nice specimens of grapes in fine variety. These gentlemen took some premiums, already specified in our report of awards, which were especially deserved. Napa Valley is now credited, as it deserves to be, with a reputation for excellent fruits. R. B. Woodward exhibited some of the fairest apples on the tables and took a premium for the same.

Some fine corn, melons, squashes, one enormous cucumber and some choice nuts, etc., were exhibited from Napa.

TO KEEP FLIES FROM HORSES.—The *Journal of Chemistry* gives the following as a preventive of horses being teased by flies:—Take two or three handfuls of walnut leaves, upon which pour two or three quarts of cold water; let it infuse one night and pour the whole next morning into a kettle, and let it boil for a quarter of an hour. When cold it will be fit for use. No more is required than to moisten a sponge, and before the horse goes out of the stable let those parts which are most irritable be smeared over with the liquor, namely, between and upon the ears, neck, the flanks, etc. Not only the gentleman or lady who rides out for pleasure will derive satisfaction from the walnut leaves thus prepared, but the coachman, the waggoner, and all others who use horses during the hot summer months."

A GOOD MOVE.—The farmers in some directions are already making preparations for plowing, in order to secure the early sowing of their grain, so that they may get the full benefit of the winter rains. This is a move in the right direction, and should be supplemented by deep plowing, fallowing and improved culture generally. The benefits of deep plowing and summer fallowing have been fully shown the past season, by some of the more intelligent farmers in almost every portion of the State. It is to be hoped that the examples they set will be still more generally followed the coming season.

THE VINTAGE IS NOW AT HAND. The *Sacramento Reporter* of last Saturday says:—"We are advised that the vintage at B. N. Bugbey's Natoma Vineyard will commence next week, and that the work will be in full progress in about three weeks from this date. It is calculated that the yield of wine will be at least 90,000 gallons this season. Casks, etc., for the yield of the current season are being forwarded daily to the vineyard."

What I Know of Farming—No. 35.

Accounts in Farming.

Farmers, it is urged, sometimes fail; and this is unfortunately true of them, as of all others. Some fail in integrity; others in sobriety; many in capacity; most in diligence; but not a few in method or system. Quite a number fail because they undertake too much at the outset; that is, they run into debt for more land than they have capital to stock or means to fertilize, and are forced into bankruptcy by the interest ever accruing upon land which they are unable to cultivate. If they should get ahead a little by active exertion throughout the day, the interest would overtake and pass them during the ensuing night.

Few of the unsuccessful realize the extent to which their ill-fortune is fairly attributable to their own waste of time. Men not naturally lazy squander hours weekly in the village or at the railroad station, without suspicion that they are thus destroying their chances for success in life. To-day is given up to a monkey-show; half of to-morrow is lost in attendance on an auction; part of next day is spent at a caucus or a jury trial; and so on, until one-third of the year is virtually wasted.

Now, the men who have achieved eminent success, within my observation, have all been rigid economists of time. They managed to transact their business at the county-seat while serving there as grand or petit jurors, or detained under subpoena as witnesses; they never attended an auction unless they wanted something which was there to be sold, and then they began their day's work earlier and ended it later in order to redeem the time which they borrowed for the sale. I do not believe that any American farmer, who could count up three hundred full days' work in every year between his twenty-first and thirtieth, ever yet failed, except as a result of speculation, or endorsing, or inordinate running into debt.

I would, therefore, urge every farmer to keep a rigid account current of the disposal of his time, so as to be able to see at the year's end exactly how many days thereof he had given to productive labor; and how many to such abiding improvements as fencing and draining; and how many to objects which neither increased his crop nor improved his farm. I am sure they would be amazed at the extent of this last category.

If every youth who expects to live by farming would buy a cheap pocket-book which contains a diary, wherein a page is allotted to each day of the year, and would, at the close of the day, or at least while its incidents were still fresh in his mind, set down under its proper head whatever incidents were most noteworthy, he would thus provide himself with annual volumes of facts which would prove instructive and valuable throughout his maturer years.

The good farmer will, of course, keep accounts with such of his neighbors as he sees fit to deal with, and he ought to charge all, credit a borrowed plow, harrow, reaper, log-chain or other implement, precisely as though it were meal or meat of an equal value. I judge that borrowed implements, if regularly charged at cost, and credited at their actual value when returned, would generally come home sooner and in better condition.

But the farmer, like everyone else, should be most careful to keep debt and credit with himself and his farm. If a dollar is spent or lent, his books should show it, and let items and sum total stare him in the face when he strikes a balance at the close of the year. If there has been no leakage either of dimes or of hours, he will seldom be poorer on the 31st of December than he was on the 1st of the preceding January.

Most farmers fail to keep accounts with their several fields and crops, yet what would be more instructive than these? Here are ten acres of corn, with a yield of 20 to 40 bushels per acre—a like area and like yield of oats, a smaller or larger of rye, buckwheat and beans, as the case may be. If the produce is sold, most farmers know how much it brings; but how many know how much it cost? Say the corn brings 75 cents per bushel, and the oats 50 cents; was either or both produced at a profit? If so, at what profit? Here is a farmer who has grown from 100 to 300 bushels of corn per annum for the last 20 years; ought he not to know by this time what corn costs him in the average, and whether it could or could not with profit give place to something else? Most farmers grow some crops at a profit, others at a loss; ought they not to know, after an experience of five to ten years, what crops have put money into their pockets, and what have made them poorer for the growing?

Of course, there is complication and some degree of uncertainty in all such account-keeping; for every one is aware that some crops take more from the soil than others, and so leave it in a worse condition for those that are to follow, and that some exact large reinforcements of fertilizers, whereof a part only is fairly chargeable to the first ensuing product, while a large share inures to the subsequent harvests. Each must judge for himself how much is to be credited for such improvement, and how much charged against other crops for deterioration. He, for example, whose meadows will cut from two to three tons per acre of good English hay may generally sell that hay for twice if not thrice the immediate cost of its production, and so seem to be realizing a large profit; but, if he gives nothing to the soil in return for the heavy draft thus made upon it, his crop will dwindle year by year, until it will hardly pay for cutting; and the diminution in value of his meadows will nearly or quite balance the seeming profit accruing from his hay. But account-keeping in every business involves essentially identical calculations, and the merchant who this year makes no net profit on his goods, but doubtless the number of his customers and the extent of his trade, has thriven precisely as has the farmer whose profit on his crops has all been invested in drains permeating his hogs, and in lime, plaster, and other fertilizers, applied to and permanently enriching his dryer fields.

"To make each day a critic on the last" was the aspiration of a wise man, if not a great poet. So the farmer who will keep careful and candid accounts with himself, annually correcting his estimates by the light of experience, will soon learn what crops he may reasonably expect to grow at a profit, and to reject such as are likely to involve him in loss; and he who, having done this, shall blend common sense with industry, will have no reason to complain thereafter that there is no profit in farming.—*Horace Greeley.*

CHEESE FROM THE EAST.—It is said that about 2000 cheeses were received in this city, by rail from the East for the four weeks previous to the 15th instant, which sold to jobbers at 18 to 20 cents per pound, although there was plenty of California cheese in the market at from 12½ to 15 cents. This does not speak very well for our California dairymen.

SHEEP POISONED.—Mr. Wm. Knox lost 700 sheep, by poison, last week, out of a flock of 2,500 in a pasture near Pacheco, hired for their temporary herding. It is said that poison had been scattered in the field some time ago to kill squirrels. A case of most gross carelessness.

THE CAMELS of which we formerly heard so much in the state of Nevada, are still doing well, and packing salt from the desert, to Virginia city. They now number 54 in all, 24 of them being natives of Nevada.

Notices to Correspondents.

RECEIVED.—We shall notice, at the first opportunity, the correspondence received from L. P. Mc., on Placer and Nevada counties; from C. H. A., on a roasting furnace; from MINER, on the Smelting and Mining Interests of White Pine; besides one or two previously mentioned. We are glad to receive so many communications, and are stretching our columns to their utmost, to insert as much as possible at the earliest possible moment.

A PUBLIC BENEFACTION.—When Mr. R. B. Woodward threw open to the public his beautiful gardens, asking only a nominal entrance fee to pay for the expense of keeping them in order, he did an act which deserves public recognition. Here the laboring man can take his family and give them a day's pleasure, which they cannot otherwise obtain without considerable expense. They may see here all varieties of natural curiosities, may witness varied and entertaining performances, may wander amid tropical groves or take a sail on the beautiful little pond, or listen to enchanting music. Not only does the liberal proprietor give a pleasing entertainment on the ground, but he provides a cheap conveyance thither, and his "What Cheer House" affords excellent and inexpensive board and lodging to those who are obliged to spend a part of their time at public houses. We have lately received a number of photographs taken at the gardens. The Museum, Art Gallery, Gymnasium, and different parts of the grounds are here shown; there are illustrations of the various birds and animals, of a Japanese performance, etc. For these and many pleasant hours at Woodward's Gardens, we return thanks.

UNIVERSITY OF THE PACIFIC.—The cornerstone of the University building, at San Jose, was laid on the 10th inst., under the auspices of the Odd Fellows of that place. The exercises attracted a large number of people. The opening address was by Judge T. H. Lane, the first graduate of any college in this State. Dr. Sinex, President of the University, laid the cornerstone. Considerable enthusiasm was evinced by those present.

Mr. Hoop.—The height of this mountain, according to the late measurement of Prof. Collier, is 11,218 feet.

The City Foundries.

A walk among the foundries shows more activity than there has been for some time previous. Although the times still are dull in many respects, yet the foundry-men generally are doing very well, and although there are, perhaps, not so many larger orders on hand as might be desired, yet there is plenty of work to keep a large number of men employed.

The Golden State Coöperative Works have just sent off a 15-stamp mill for the Wheeler mining company at Pine Grove, Nevada. They have previously sent up the engine, etc., for these works. They are building a 10-foot cast iron astrata for the Pioneer mine near Volcano, Amador county. They are making shifting, pulleys, etc., for the California Peat compny, which is at work, on Sherman Island, ditching, building dykes, etc. They have on hand some work for a Smith Truss Bridge, which is to be thrown over Tanitus creek at Pescadero; and they have large orders for shoes and dies, principally for Washoe.

The Fulton Works are building a large 40-stamp mill for the Sierra Buttes mining company in Sierra county. This mill is to be driven by a 65-foot overshot water-wheel. They have lately sent off one of Severance & Holt's tunnel drills, which has given such excellent satisfaction that more are to be made, of such a construction as to work four drills at once. They are getting up a 15-horse engine and boiler and a Brodie Crusher of the largest size, which is to be used at Oakland for breaking up rock for macadamizing purposes. A large machine, with a 10-foot iron disk, is being made for the purpose of dressing the freestone used in the new Mint. There is an order for hydrants for San Jose. A press is being made for taking off and putting on car-wheels, for the Los Angeles and San Pedro Railroad, and they have some bridge work on hand. They are also making castings for Taylor's Smelting Works; rolls, cores, etc., for the Asphaltum Pressure Pipe company; and have various smaller jobs on hand, which keep them busy.

At the Etna, work is being done on a house front for a building near the corner of Kearney and Post streets. A large steam engine (cylinder 25x35) for a ferry boat is being manufactured to go up to Oregon. A 5-stamp mill is being constructed for a mine in Arizona. They have on hand a Tule plow, a late invention of Mr. A. Swingle. In this the plow-frame carries several rollers which are provided with knives so arranged as to cut in different ways. They are also about to commence work on a new steam plow—the Eureka—the invention of Messrs. Stewart & Starr, of Vallejo, with four revolving cutters, at the rear of the engine, working something after the fashion of screw propellers. They are making a tie-laying machine, the invention of Mr. J. R. Adams, of the Central Pacific Railroad; heaters, irons, boiler-fronts, etc., for the Anti-Coolio Laundry; and have various other job-work of different kinds.

The Risdon Iron Works have the full complement of men busy on the iron pipe, to which we have previously alluded, and on orders of varied description.

The Vulcan Works have also, apparently, enough to do to keep them from complaining, to say the least. They are building a 15-stamp mill to go to Mexico, with iron mortar-beds, wrought iron honeings, 650-pound stamps, steam engine and tubular boiler, Hepburn pans, settler, etc. They are making two large tubular boilers for the San Francisco Sugar Refinery; also a large boiler for Duncan & Warren's tannery. A 30 horse power engine for the Mission Woolen Mills, with shaftings, etc., for the extension, is under way. And a large number of car-wheels, axles and castings of varied description are being made, giving work enough to employ about a hundred and fifty workmen.

California Sugars.

An attractive and interesting feature of the present State Fair, in Sacramento, is the exhibit of indigenous sugars by W. Wadsworth.

There are three samples of beet sugar, No. 1, 2 and 3, which were made last year, whilst Mr. Wadsworth was Superintendent of the Sacramento Valley Beet Sugar Company's works and were made by him or rather he made the raw sugar, sample No. 1, and from this made the improved samples No. 2 and 3.

These sugars are of excellent flavor and superb grain, showing conclusively that the two points or qualities that constitute the essential excellence of all good sugars, are not wanting in California grown beets. The only possibility that can stand in the way of a grand success in the manufacture of sugar in California, is the high price of labor and fuel.

But even at the present rates, a fair margin of profit is left the producer above the cost of production, and this should stimulate our agriculturists to active exertions in the way of introducing and fostering this new industry.

Melon Sugars.

Mr. Wadsworth also exhibits two samples of melon sugars, of his own production, which are even superior to his beet sugar, in point of flavor, if they do not quite equal it in grain.

The sample from canteloupes is of a peculiar flavor but decidedly good; whilst that from watermelon has a beautiful color and possesses an excellent flavor.

If there is one product besides grapes and beets, in which the soil and climate of California excel all others in producing, that product is the melon. As many melons can be raised on one acre, with one fourth the cost of cultivation, and the surplus seeds over what are required for the next year's crop of melons, will yield a table oil equal to the best, and in quantity that will pay one half the cost of cultivating the melon crop.

We think Mr. Wadsworth deserves great credit for his persevering efforts to introduce the manufacture of home made sugar in California, as he has certainly demonstrated its entire practicability.

DEEP DRILLING.—We have been presented with a piece of quartz of the hardest, crystalline description, which was taken out of a hole, 234 feet deep, by one of Severance & Holt's Diamond Drills. The machine has been at work at the Union mine, at Carson Hill, near Angell Camp, Calaveras county. It was desired to prospect the vein, which dips at an angle of about 45°, at a low depth. The drill was placed at an angle of 45°, so as to strike the ledge at right angles, and after drilling the above given distance, the vein was struck and found to be 20 feet wide. The core was removed and is now in the hands of the assayers. We are informed that the rock promises better at this depth than it did nearer the surface. The drill worked excellently well.

THE GRAND BALL, given by the proprietors of the Lick House, in honor of Gen. Sherman, came off on Thursday evening, after our forms were made up for the press. The preparations were of the finest character and on the grandest scale. The Governor, Major General Cobb and other officers of the army, and distinguished persons of our city were invited, and, indeed, an attendance of some three thousand persons was expected.

ACKNOWLEDGMENT.—We are indebted to Mr. L. A. Gould for several boxes of assorted fruit from his extensive fruit orchards in Santa Clara. The *Hearth and Home*, in a late issue, pronounces the products of these orchards "the best on the Western slope."

The State Fair at Sacramento.

The exhibition at the Pavilion presents many interesting articles, which we shall mention in future numbers. The display of sheep is excellent, and larger than usual. The show of horses is extensive and in part very good. It almost monopolizes the fair grounds. The "croppings" of several new products and home industries are the most encouraging features of the show, and we are glad to welcome them as indications of a brighter future coming on with its diversified products and manufactures.

As usual, exhibitors were slow in getting their articles in place. During Monday and Tuesday, the Pavilion displayed a scene of bustle and activity, the multitude of operations in progress being quite past finding out. The display of fruit, though creditable, is quite inferior to the late exhibit in this city. At our latest dates there was but one exhibit of flowers. The show of agricultural machinery and of stock, are both quite good. Owing to the early hour at which it is necessary to go to press, we are obliged to defer our regular report until next week. In the meantime, however, we have given, in another column, a somewhat extended notice of the very suggestive exhibit, by Mr. W. Wadsworth, of some sugars made by him from California grown beets and melons. The experiment of making sugar from melons is very interesting, and may lead to important practical results.

Our report may be expected from week to week hereafter.

LECTURE.—Prof. Price delivered a lecture on Gases, last Saturday evening before the Mechanics Institute. The lecture was rendered all the more attractive by a number of beautiful experiments showing the brilliancy of the light produced by gases under certain conditions. A slight accident, caused by the bursting of a bottle, created a momentary sensation, but did not otherwise interrupt the lecture, which was most interesting.

THE SURVEY of the boundary line between Nevada and Utah will be commenced next week. Isaac Jamee has the contract and will take a party of twelve to fourteen men. The survey will be commenced at the railroad and the line run north to Idaho. Then the party will return to the railroad and run the line south.

THE SOUTHERN PACIFIC RAILROAD, according to a telegram from New York on the 13th inst., has temporarily organized, with General Fremont as President, A. M. C. Hunter as Vice-President, John D. Freres as Secretary and Marshal J. Roberts as Treasurer.

A small photographic apparatus, somebody says, has been invented, which gentlemen can carry around in their pockets, and with which they can take the likeness of their lady friends at a moment's warning. That supposes, we presume, that the lady friends will be kind enough to remain quiet a moment. With this apparatus, Jenkin will be able to add likenesses to his descriptions in the papers.

STEEL RAILS.—It is estimated, in round numbers, that 110,000 tons of steel rails, equal to 1,100 miles of steel road, had been laid in the United States up to the close of 1869.

SUGAR REFINERY.—Jersey City, close by New York, has a sugar refinery which covers over seven acres and is the largest in the United States. Three hundred boxes of raw sugars are used daily, and the refinery employs between 300 and 400 workmen.

GILROY is to be supplied with water brought from Uvas creek. An eight-inch pipe is to be laid, which will bring in 350,000 gallons daily.

Patents and Inventions.

A Full List of Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS TO DEWEY & CO., U. S. AND FOREIGN PATENT AGENTS, AND PUBLISHERS OF THE SCIENTIFIC PRESS.]

FOR THE WEEK ENDING SEPTEMBER 6TH.

GANG-PLOW.—James H. Andrews, Benicia, Cal.

STREET-LAMP.—Emil Boesch, San Francisco, Cal.

MAXILLARY COMPRESS.—Cornelius E. Davis, St. Helena, Cal.

FRUIT-CARRYING BOX.—George A. Lloyd, San Francisco, Cal.

REACTION ROTARY STEAM-ENGINE.—Antedated August 26th, 1870.—Francis E. Mills, San Francisco, Cal.

GUN CARRIAGE.—Antedated August 27th, 1870.—Abiather F. Potter, Oakland, Cal.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO., in the shortest time possible (by telegraph or otherwise), at the lowest rates. All patent business for Pacific coast inventors transacted with greater security and in much less time than by any other agency.

Notes on Contributions to our Cabinet.*

Following the specimens noted in our last, come a number of minerals from Eureka and adjoining places and from Mineral Hill. We will first speak of those from Eureka district, Nevada.

These may be divided into three classes, viz:—those which consist principally of carbonate of lead; those which contain a large amount of galena; and those which are stained with copper carbonates and hold tetrahedrite.

No. 475.—This is a specimen from the Champion mine and belongs to the first class. It is of an earthy appearance, is stained with iron oxide, and might easily be passed by without notice, were it not for its weight.

No. 476.—From the Sea King ledge, is an example of the second class. Besides the yellow carbonate, there is a very large proportion of sulphuret to be seen. No. 477, from the Bull Whacker ledge, consists of two specimens,—one of carbonate and one of coarsely crystallized galena.

No. 478 and 479, from the Excelsior and the Mary Ann ledges, are examples of the third class. These are stained green with copper and show considerable tetrahedrite. No. 480 is from the Gem of Nevada.

No. 481.—This is a piece of sandstone from Pancake mountain, a sandstone containing some alumina. No. 482 is a similar piece from McDonald's quarry, two and a half miles out of Eureka. These are used for lining the smelting furnaces. We have also a specimen, No. 483, of the "sandstone" used for building the retaining walls of the furnaces, which is a tufa-like rock.

Nos. 483, 484 and 485 are from Spring Valley. The first is from the North Star, the second from the Murray and the third from the Reeves and Berry ledge. They contain different minerals, as carbonate of lead, etc., but the most noticeable is an antimonial silver ore, in which the second specimen is especially rich.

From Secret Cañon we have four specimens, two from Messrs. Paige and Corwin (Nos. 486 and 487), one from the Bromide ledge (No. 488), and one from the Hodgdon mine (No. 489). These present rather different appearances, according to the amount of iron stains. The specimens from the Paige and Corwin ledge are very handsome. We have previously alluded to one of them in a former issue of our paper. It is somewhat decomposed, holds some fahl ore, and has some specimens of beautifully crystallized hornsilver.

No. 490 is a specimen from a copper mine on the Woodruff and Ennor stage road near Eureka district. It is generally of a green color, from carbonate of copper, with, perhaps, some tetrahedrite.

*Under this heading we shall continue to mention and describe, according to merit, such specimens of ores, minerals, fossils, curiosities, etc., as may be sent to us by mail or express prepaid. Each article will be numbered, marked with the name of the donor and the locality, and placed in our cabinet. A full account of the place, occurrence, etc., when sent adds much to the value of such specimens.

Safety Hoisting Machine.

So long as our mines extended but a short distance below the surface, we heard but occasionally of accidents in the shafts. Now, however, that the miner has, in certain localities on the coast, penetrated far down into the bosom of the earth and the operations are conducted on a larger scale, so that it is necessary to provide especially for the ascent and descent of the workmen, the reports of ugly mishaps are getting more and more frequent. It is only a few days ago that we heard of a bad accident which happened to miners while ascending a long shaft. Our hotels are now using "elevators" for the use of their guests, and the number of hoisting machines in our stores is getting very large. It behooves us then to look carefully to the engines used, and to employ all possible means to prevent the possibility of accidents.

The manufacturers of the machine here

when only one engine is used. Power is transmitted by a beveled gear and pinion and a worm, or endless screw, to the spur-wheel on the winding drum on which the rope is wound. Thus should the engine or gearing break, the drum will be merely stopped and held in place. We might speak at length on several other points, but we think this hardly necessary, as the cut shows the engine clearly enough.

The machine is in a very limited degree liable to derangement when in use, and can be operated by comparatively unskilled attendants, although, in our opinion, none but skilled engineers should be allowed to touch an engine. Patents covering the apparatus have been granted, and the machines, being compact, powerful and economical, are very favorably known in many localities. The agents for the Pacific Coast are Messrs. Wiester & Co., 314 Bush street, San Francisco, and from them any desired information may be obtained.

BACON'S PATENT SAFETY HOISTING MACHINE.

illustrated, claim to have an apparatus which possesses in a high degree the characteristics of simplicity, cheapness and readiness for being set up for work, combined with the strongest safeguards against accidents. The engraving itself shows the machine so that it can be readily understood by any one who is at all conversant with engines of the kind. We can, however, indicate one or two points of importance.

The engine used is of the variety known as the trunk engine, and has, besides the general advantages of this class, several peculiar to itself. The trunk is of oblong form, in horizontal section, instead of being cylindrical, as is usual, and thus a smaller cylinder is required while a greater area of piston is obtained. This greater area of piston gives a proportionately greater stroke, which, in practice, is more than double that obtainable in the ordinary trunk engine.

The connecting-rod is made of strong pipe, and in it is inserted another rod, which is worked by gib and key at the upper end, and serves to tighten simultaneously both the upper and the lower brasses of the connecting rod.

There is an engine of the kind at each end of the driving shaft, thus avoiding all danger of wrenching this shaft, and escaping the liability of stopping at the dead points of the stroke, two sources of trouble

A BUSINESS CHANCE.—We are sorry to learn that Messrs. Faulkenau and Hanks, of the Pacific Chemical Works, have concluded not to continue the manufactory, their term of partnership having expired. Henceforward Mr. Falkenau, who is State Assayer, may be found at 421 Montgomery street, where he has a laboratory and will continue to make assays, analyses, etc., as heretofore. Mr. Hanks is fitting up some large rooms at 649 Clay street, where he has his assay rooms and chemical laboratory. Mr. H. will make the buying and selling of minerals a special branch of his business and will have a room filled with minerals which may be examined by the public. He will make fine chemicals, analyse minerals, give lessons in the determination of minerals, assaying, etc. Both of these gentlemen have excellent and well deserved reputations and we wish for them continued success. We are sorry, however, to have their former business removed from our list of home industries.

COMPLETED.—A telegram from Portland, on the 12th Sept., states that the Oregon Central Military road, commenced in 1864, is now open from Eugene City to Silver City, Idaho, one hundred and sixty miles. Over one hundred and fifty thousand dollars have been expended by the company, which has a grant of land amounting to 300,000 acres in alternate sections.

SNOW PLOW.—The Sacramento Union has been shown a working model of a snow plow recently invented by Mr. T. C. Churchman, of that city. The nature of the invention consists in providing the front part of the railroad track with flat aprons, two perpendicular cylinders, with flanges located back of the apron, and fenders back of the cylinders. With the apron the snow is lifted from the track, when the engine driving the plow is in motion, and carried to the cylinders, which, revolving rapidly by means of usual gearing attached to the engine, throw the snow to the side or sides of the road, as the case may be, from whence it is pressed outwardly by the fenders.

THE MAXWELL LAND GRANT & R. R. Co. The Santa Fe Post, of Aug. 27th, thus speaks of an enterprise, which, if properly managed, bids fair to be of great importance to New Mexico:

Since it became known that Hon. L. R. Maxwell contemplated a sale of his land grant, much interest has been felt in its future, and the people of our Territory have looked forward with hope and anxiety for its speedy development under the management of its new owners. As reported in our columns yesterday, the purchasers, under the title of the Maxwell Land Grant and Railway Co., have perfected their organization and assumed control of the estate. Of their plans we cannot speak in detail as yet. It is known, however, that they are determined to move on energetically in the improvement and development of the estate. The management of the affairs of the company is at present vested in the President, John Collinson, Esq., a gentleman of shrewd business capacities. It is now believed that during the next season a number of immigrants, who come under the auspices of the company, will settle on the grant, and it is proposed to select that class of people who will be at once an advantage to themselves and the community. A portion of them will be practical and skilled miners; mechanics, farmers and laborers will constitute the remainder. No one really interested in the welfare of New Mexico can be disinterested in the success of this company. Their success will attract immigration, capital and railroads and practically prove the wealth of New Mexico.

GRAIN ELEVATOR.—They have grain elevator buildings in Detroit capable of holding seven trains of grain, forty cars to the train. During a busy season it is nothing unusual to receive and ship 30,000 bushels a day, and that, too, with the aid of but 15 men. The two belts which run all the elevating apparatus are each 240 feet long and 30 inches wide, not only scooping 30,000 bushels from the cars, but also lifting this grain (if to be shipped) up more than 130 feet twice during a single day. These belts cost \$5,000 a piece, and it took the combined hides of 1,200 cattle to make them.—Etc.

THE WOODS above Nevada City, on the Washington ridge, have been burning some three or four weeks. It's nobody's business in particular, as the Alta has remarked, to put out this fire, and nobody is going to do it. The State, County, Central Pacific R. R., and individuals all lose immensely. Carelessness occasioned the fire and carelessness will let it burn out.

COLONIZING.—The agent of a colony of Southern and Western families have purchased 3,000 acres of the Juapa grant in San Bernardino county. So we hear, and hearing, rejoice at the prospect of seeing good colonists in our State.

The California Powder Works

No. 614 CALIFORNIA STREET,
SAN FRANCISCO.

Manufacturers and have constantly on hand

SPORTING, I
MINING,
And BLASTING
POWDER,

OF SUPERIOR QUALITY, FRESH FROM THE
MILLS. It being constantly received and transported
into the interior, is delivered to the consumer within a
few days of the time of its manufacture, and is in every
way superior to any other Powder in Market.
We have been awarded successively

Three Gold Medals
By the MECHANICS' INSTITUTE and the STATE AG-
RICULTURAL SOCIETY for the superiority of our
products over all others.
We also call attention to our

HERCULES POWDER,
Which combines all the force of other strong explosives
now in use, and the lifting force of the BEST BLASTING
POWDER, thus making it vastly superior to any other
compound now in use.
A circular containing a full description of this Pow-
der can be obtained on application to our Office.

LEA & PERRINS'

CELEBRATED

Worcestershire Sauce.

Declared by Consola-
ments to be the only good
SAUCE. The success of
this most delicious and
unrivalled Condiment
having caused certain
dealers to apply the
name "Worcestershire
Sauce" to their own
inferior compounds, the public is
hereby informed that the only way to
secure the genuine is to ask FOR LEA &
PERRINS' SAUCE, and see that their names
are upon the wrapper, labels, stopper and
bottle.

Some of the foreign markets having
been supplied with a spurious Worcester-
shire Sauce, upon the wrapper and labels
of which the names of Lea and Perrins have been
forged, L. and P. give notice that they have furnished
their correspondents with power of attorney to take in-
stant proceedings against manufacturers and vendors of
such, or any other imitations by which their right may
be infringed.

Ask for LEA & PERRINS' Sauce and see names on
wrapper, label, bottle and stopper.

ter; Crose and Blackwell, London, &c. &c., and by
Grocers and Oilmen universally. Agents, CROSS &
CO., San Francisco. 1v20-1yoo

The "Pain Killer,"

After thirty years trial, is still receiving the most
unqualified testimonials to its virtues, from persons of
the highest character and responsibility. Physicians
of the first respectability, recommend it as a most effec-
tual preparation for the extinction of pain. It is not
only the best remedy ever known for Bruises, Cuts,
Burns, etc., but for Dysentery or Cholera, or any sort of
bowel complaint, it is a remedy unsurpassed for effec-
cy and rapidity of action. In the great cities of India,
and other hot climates, it has become the Standard
Medicine for all such complaints, as well as for Dys-
pepsia, Liver Complaints, and other kindred disorders.
For Coughs and Colds, Canker, Asthma and Rheumatic
difficulties, it has been proved by the most abundant
and convincing testimony, to be an invaluable medi-
cine. Directions accompany each bottle.

Sold by all Druggists.
Price 25 cts., 60 cts., and \$1 per bottle.

THE EARLIEST WAY IS BEST.—To send fire and sword
through the bowels of the land, would be scarcely more
cruel than it is to tear and wreck the delicate and excu-
sive membranes and tissue of the discharging organs,
with a convulsing purgative. No medicinal preparation
at present known, so completely, permanently, and
painlessly relieves constipation, as TARRANT'S EFFE-
VESCENT SELTZER WATER, and as it simultaneously
invigorates the digestion, regulates the action of the
liver, and refreshes the debilitated system it is justly es-
teemed both by medical men and the public at large, as
an indispensable specific in dyspepsia, bilious attacks,
sick headache, physical prostration, and all complaints
affecting the secretive, assimilating and discharging
organs.

SOLD BY ALL DRUGGISTS.

DESIGNS AND PLANS
—FOR THE—
NEW CITY HALL
—OF—
SAN FRANCISCO.

Office Board of City Hall Commissioners, southeast
corner of Sacramento and Montgomery streets, San
Francisco, June 22, 1870.

The Board of City Hall Commissioners hereby give
notice that they will be prepared to receive at their
office, on or before the FIRST DAY OF NOVEMBER
NEXT, designs and plans for the new City Hall of San
Francisco.

The Commissioners, in order to obtain the very best
design and plan, invite the fullest competition among
architects, and to this end have resolved to offer the fol-
lowing premiums:

First—For the design and plan selected and
adopted..... \$2,500
Second—For the second best design and plan..... 2,000
Third—For the third best design and plan..... 1,500
Fourth—For the fourth best design and plan..... 1,000
Fifth—For the fifth best design and plan..... 500

The premiums payable in City Hall warrants.

As a guide to architects in the preparation of the de-
signs and plans, the Commissioners have prepared a
pamphlet containing full instructions and suggestions,
as well as the terms and conditions upon which the pre-
miums will be awarded.

Pamphlets can be had on application at the office of
the Commissioners.

Any design or plan in which the requirements of the
Board, as set forth in the printed instructions, have not
been reasonably complied with, will be rejected from
the competition.

P. H. CANAVAN, Chairman,
JOS. G. EASTLAND,
CHAS. E. McLANE,
City Hall Commissioners.

Reading for the Hour.

Rail And Wire.

BY THE AUTHOR OF "THE CLOUDS."

Rail and wire, by wheel and fire,
Plying hard their joint vocations,
As they sweep o'er land and deep,
Are bringing close the scattered nations.
Over land the iron steed
Swallows distance up in speed,
And the chariot of the sun
Is by courier wire outrun.
Albion speaks to Hindostan;
She replies, ere dove or swan
Could on swiftest pinion fly
From Isle of Wight to Isle of Skye.
Friction's drag is rent asunder,
Lightnings speak, but not in thunder;
Up they dash the breathless steep,
Down they dive into the deep.
Ocean bars the way no more,
Shore is linked to furthest shore;
And in weather fair or foul,
Talk together cheek by jowl.
Night no longer blocks the way,
Darkness works as well as day;
And while mca and fishes sleep,
O'er the land, and through the deep,
Rush the fiery couriers on,
Swift as thought, and mute as stone:
Let us, then, with plaudits hail
Steam and lightning, wire and rail!

Wheel and wire, by steam and fire,
Are breaking up the whole foundations,
And blotting out the base and doubt
Which kept apart the jealous nations.
Gates and walls are giving way,
Mountain range and briny bay
Ope their bosoms to embrace
Men of every clime and race.
Ancient laws are put to rout,
Which erewhile shut aliens out;
Boa-like, with fold on fold,
Clings the new around the old.
Commerce widens, traffic thickens,
Errors languish, knowledge quickens;
And by every conquest gained,
Other triumphs are attained.
One by one the scattered nations
Join in mutual ministrations—
East and west, and south and north,
Pour their special treasures forth.
Soon from pole to torrid zone
Earth one common board will own,
And Babel's curse be half forgot
When men shall speak in polyglot:
Let us, then, with welcome hail
Steam and lightning, wire and rail!

Rail and wheel, and wire and keel,
Are changing fast the old locations,
Nor will cease till pipes of peace
Are handed round to all the nations.
Men in troops the world are ranging,
Crafts and occupations changing,
Arts advancing, science, learning,
Enterprise new conquests earning;
And as stones by streams are polished,
Old aversions are abolished.
Prejudice is giving way,
Reason reassumes its sway;
Power departs from east and hue,
Customs old give place to new;
Yokes relax and cease to gall;
Fetters from the bondsmen fall.
Forced is pride, as best it can,
To own as man his fellow man;
And the nations strive to find,
Fitting laws to guide mankind.
Bigotry conceals its ire,
Persecution damps his fire;
Truth is finding open door
Where the blind wall frowned before:
Let us, then, with welcome hail,
Steam and lightning, wire and rail!

New Gazetteer and Directory.

The Western Shore Gazetteer and Commercial Directory for the State of California is the title of a work, the first volume of which is now in the hands of the printer. One volume is to be devoted to each county. The scope of the work, as illustrated in this first part, is the widest of any yet undertaken. The history, organization, and thorough description of each county, its towns, roads, lands, resources, financial condition, all will have an ample devoted to them. The names, business, and profession of each inhabitant will be given in a convenient arrangement. Each hoof of stock, each cultivated acre of ground will be enumerated, with its possessor. The quality and value of the land in all parts of the district will be given, and the kind and quantity of crops grown thereon. The merchant will be able to learn the position of his customers, the farmer and the mechanic will know what chances are here open to them. The convenience and importance of the work, if properly managed, will be immense.

Of course, it is necessary that the work should fall into proper hands. We are assured that no pains have been spared, and that the greatest care has been exercised to get the most correct information. The projector of the enterprise is Mr. H. W. Atwell, who is familiar to many as "Bildad the Scribe." This gentleman has traveled over the county of which Volume I. treats, on foot and by horse, and has worked personally for a long time, besides having employed numerous responsible agents. He is connected in the enterprise with Mr. C. P. Sprague, a lawyer of Woodland. The present volume comprises some 3,000 names and makes a book of 600 pages. If there is a fair prospect of success held out, the work will be extended to all the counties of the State, and a new edition will appear each year. Being interested in the progress and development of our Coast, we cannot but give our best wishes for the projected enterprise.

Leather in the Tea-Cup.

Everybody knows, we presume, that leather is made by steeping hides in an infusion of certain vegetable substances which contain a compound called *tannin*. The cheapest source of this tanning principle is oak bark, but it is found in greater or less quantity in many other plants, as in the grape, the hop, coffee, tea, etc., and from these it can be dissolved out with water. The skins of animals consist mainly of albumen and gelatine; indeed these substances are abundant in all animal matter. In the blood and in milk the albumen is merely suspended, as it were, in the water which constitutes by far the larger portion of these fluids. Tannin and albumen have a remarkable affinity for each other, and unite as soon as they are brought in contact. The result of their union is the insoluble, tough material which gives leather its distinctive character. When the hide is steeped in the infusion of oak bark, the albumen of the former thus combines with the tannin of the latter, and the loose, soft tissues of the skin is converted into hard, tough leather.

Now when we pour milk into a cup of tea or coffee, a similar chemical combination occurs. The albumen of the milk and the tannin of the tea instantly unite, and form leather—or minute flakes of the same compound which is produced in the texture of the tanned hide, and which, as we have said, makes it *leather* as distinguished from the original skin.

Tannin has a peculiar taste which is technically called *astringent*. We can detect this flavor in chewing the skin of a grape or the stones of a raisin, and in coffee and before the milk is added. One of the main objects in using the milk is to mitigate this astringent taste, and thus enable us to enjoy more perfectly the true flavor of the tea or coffee. Some people prefer the full astringency of the tannin, unmodified by the milk, and so take the beverage without the leather; but with most of us the tea-cup regularly becomes a miniature tannery.

In the course of a year, a tea-drinker of average habits will have imbibed enough leather to make a pair of shoes, if it could be put into the proper shape for the purpose.

It will be found, upon experiment, that a small quantity of milk produces a much greater opacity with tea than with water which has been made of the same color as the tea by the addition of burnt sugar.

Of course it is the minute particles of leather floating in the liquid in the former case, that causes the difference. If we put the tea into a glass and hold it up to the light, while the milk is dropped in slowly, the chemical action will be very clearly seen.

If we use a very strong infusion of tea, and put in a considerable quantity of milk, we can get a distinct precipitate of the *tannate of albumen*, or solid leather, by letting it stand for an hour or more.

We may add that the presence of tannin in tea is shown by the action of the liquid upon iron. Tannin, in most of its forms, unites instantaneously with this metal to form *ink*; and a drop of tea upon a knife-blade produces that familiar black compound at once. Singularly enough, the tannin in coffee does not unite with iron in this way, so that other tests are necessary to detect it.—*Boston Journal of Chemistry*.

PETRIFIED.—The telegraph said, last week, that a petrified seal and a petrified tree had been found in Volcano District, in Nevada. We might have doubts as to the tree, but the seal is all right; we have one ourselves.

Clothes Sprinkler.

The common method of sprinkling clothes, before ironing, by dipping the hand in a vessel of water, and then shaking it over the article of raiment, is rather an inefficient method. The clothes are unequally moistened and hence, in ironing, some parts are quite dry, while others are too damp.

The way practiced by the Chinese washerman would seem to be superior as far as regards the equal moistening of all parts of the garment. This is however, peculiarly Chinese, and will never be introduced generally in this country; at least, we hope not.

We find in the *Rural New Yorker* an illustration of a simple sprinkler, which we here reproduce. It is of tin, of the form shown, with its lower part perforated with minute holes. This is put in a vessel of water, when to be used, when it fills with water of itself. After the sprinkling of each garment, it is replaced in the water to again fill. Old dipper handles, properly perforated, are said to answer excellently well. The arrangement can also be used for watering delicate plants, sprinkling carpets, etc. The invention is credited to Mr. A. Perry, of Tyrone, New York.

REMARKABLE CREVICE.—At the northern end of Blue Hill, near the Truckee mine, was discovered, not long since, a remarkable crevice in the limestone. It is 10 or 15 feet from the surface and of sufficient width to admit the entrance of a man. Its depth is not known. Our informant states that he descended nearly 200 feet, almost perpendicular, and yet saw no evidence of its termination. The entire crevice is lined with most beautiful stalactites. It is the intention of a party of gentlemen to explore it soon.—*White Pine News*.

IRON CARS.—Cars constructed of iron are fast superseding wooden ones in all our leading mines. Though they may be sufficiently light at first, the wooden ones soon become water-soaked, heavy and clumsy, while the iron ones are always light and strong as when new. A cushion of india rubber is fastened on the end of the car to hold the miner's candle-stick, which is thrust into it as formerly into the body of the wooden car.—*Ter. Enterprise*.

THE MATTESON FURNACES.—The proper hillside site having been selected, the ground was so excavated in benches that the ore landed by teams is moved downward continually; first from the dump level into the roasting furnaces, through these to the mixing floors, thence into the melting furnaces, the metal and slags from these going off into still lower levels. The main furnace building is 189 feet long, and including the fire room, stretches out to 220 feet, all with solid stone walls, roofed with tin. This will inclose three blast furnaces, separating works, office, laboratory, engines and blast. Adjoining this, and on a level with the furnace tunnel heads, are arranged the charcoal buildings. The mixing floors, stretching out one hundred and fifty feet in length and covering an area of 7,500 square feet, are to be roofed, and the dump levels also, so far as may be necessary to protect men in assorting ores during the winter months. Five roasting furnaces for desulphurizing, rise just even with the edge of the dump levels. The three blast furnaces are of the ordinary cupola construction, with certain interior changes and peculiar discharge for slag and metals, the molten metal running into a heated iron box that is so arranged as to skim or collect the oxides that are formed by the atmosphere, leaving only the pure metals to be poured in the moulds. The appliances and machinery for the separating works, already ordered in the East, will soon be on the ground and placed in working order.—*White Pine News*.

LUMBER STATISTICS.—The following statistics, furnished the *Alta* some time ago by "Lumber Dealer," are worth republishing. The annual production in the large mills of Puget Sound, the Columbia River and the coast of California, per record kept in this city, is given as follows: 149,000,000 feet of pine (fir) lumber, of which 15,000,000 feet was dressed; 91,000,000 feet red wood lumber, of which 36,000,000 feet was dressed; 2,000,000 feet pickets dressed and undressed; 4,500,000 feet white cedar; 126,000 feet maple; 177,000 feet oak; 37,000,000 laths; 50,000,000 shingles. In addition to the above about 20,000,000 feet was exported direct from the mills to foreign ports, making in all 266,800,000 feet besides lath and shingles.

We have no reliable statements of the amount of lumber manufactured at this many mills located in the mountains east of Sacramento, none of which comes to this market, other than the sugar pine, but is all consumed in Sacramento, Marysville, Stockton, and the many mining towns and villages scattered throughout the interior portions of California. The yearly production from these various sources is not less than 40,000,000 feet, which is additional to the first estimate. The amount of fir, or spruce, which is manufactured at Humboldt, will exceed 6,000,000 feet yearly. This is embraced in the sum total as it comes under the head of pine lumber. The manufacture of laurel lumber is beginning to attract much attention, and as it is a timber growing only in certain localities, and that not extensive, it should be preserved with the utmost care, as at the last it will be but a few years before this one of the most beautiful woods of California will become extinct in use.

THE SCIENTIFIC PRESS.—To the miner and farmer we consider the *Press* the most valuable publication on the Pacific Coast. Every number contains matter of interest to the farmer and general reader; and to the miner the *Press* is a *sine qua non*.—*Inyo Independent*.

THOMAS O'NEIL, Ornamental Glass Cutter, No. 10 Stevenson street, up stairs. Stained, Ground and Ornamental Cut Glass to order on reasonable terms. 14720

MARAVILLA COCOA.—For Breakfast.—The *Globe* says: "Various importers and manufacturers have attempted to attain a reputation for their prepared Cocoas, but we doubt whether any thorough success has been achieved until Messrs. Taylor Brothers discovered the extraordinary qualities of 'Maravilla' Cocoa. Adapting their perfect system of preparation to this finest of all species of the Theobroma they have produced an article which supercedes every other Cocoa in the market. Entire solubility, a delicate aroma, and a rare concentration of the purest elements of nutrition, distinguish the Maravilla Cocoa above all others. For homeopaths and invalids we could not recommend a more agreeable or valuable beverage." Sold in packets only by all grocers, of whom also may be had Taylor Brothers' Original Non-Cathartic Cocoa and Soluble Chocolate. Steam Mills—Brick Lanes, London. 6720-ly

AN OVER-DOCTORED WORLD.—All great physicians admit that the world is over-doctored with violent drugs. In cases of indigestion, biliousness, constipation, wind colic, diarrhoea, and other casual or even chronic affections of the stomach, liver, and bowels, all that is needed to restore the regular action of this disordered organ, is a dose or two of TARRANT'S EFFERVESCENT SELTZER. APERIENT, the most delicious and harmless of all laxatives, and alterative, in the whole range of medicinal remedies. It is sufficient for the strongest, cannot harm the feeblest, and immediately relieves the nausea which ordinary cathartics aggravate.

A NEW BOOK FOR MINERS.—We have received, from the publishers, in San Francisco, a new book entitled, "Roasting of gold and silver ores, and the extraction of these respective metals without the use of quicksilver." This is a handsome little volume of 140 pages, treating on the subject quoted, and is a book that should be in the hands of every intelligent quartz miner, mill owner, and owner of quartz in this Territory. It contains an immense amount of useful information, is well gotten up, and is deserving of public patronage in all mining countries. Its author is G. Kustel, mining engineer and metallurgist, author of "Nevada and San Francisco Processes of Silver and Gold Extraction," and "Concentration of all kinds of Ores." Published and sold by Dewey & Co., proprietors SCIENTIFIC PRESS, San Francisco, California. The *Press*, by the way, is one of the best and most ably edited papers we receive, and we recommend it to intelligent readers as a journal well worthy of their patronage.—*Helenia Gazette*.

A VALUABLE BOOK FOR INVENTORS AND ARTISANS.—Dewey & Co., publishers of the SCIENTIFIC PRESS and Patent Agents, have just issued a neat little volume of over five hundred well executed cuts of the principal mechanical movements known. These useful representations of the various appliances of power are printed side by side with explanatory notes, which makes the subject clear to every reader. Such a book should be in the hands of every mechanic, and form part of every public school library. It is a handy book, and cheap enough for every farm, shop and factory. Sent by any address from the SCIENTIFIC PRESS office, postpaid, for \$1.—*New Age*.

PHOTOGRAPHY.—FOR CABINET PHOTOGRAPHS, or Enamelled Cards, of the very best quality, you must go to the NEW YORK GALLERY, Nos. 25 and 27 Third street, San Francisco. Every picture warranted to give satisfaction. 10418 6m B. F. HOWLAND.

BOILER FELTS saves twenty-five per cent. of fuel. BERRY & PLACE'S MACHINERY DEPOT, No. 114 California street. 1v21-3m

BLOCK TIN AND SOLDER WIRE, broom wire, piano covering wire, etc., manufactured by Joshua Gray, 437 Brannan street. 2v19-3m

HAVING had numerous applications to purchase the right to manufacture CHAMPAGNE MEAD (the great temperance drink), we will state that we are now prepared to sell State and County Rights on reasonable terms. KENTON, GARR & CO. 2v21-3m

San Francisco, July 10, 1870
The Scientific Press is devoted specially to matters of machinery, inventions and processes pertaining to the development of mines, and gives free and full discussions of such matters. Terms, \$4 per year.—*White Pine News*, May 40.

The Northern District Fair.

Our special correspondent has furnished us with a large mass of notes from the Northern District Fair, held last week at Marysville, which we are compelled, for want of space, to greatly condense.

Notwithstanding the lengthy notice given and ample space provided by the managers, many things were lacking on the part of the exhibitors to make the Fair what it should have been. It is really provoking and to be deplored that no more interest is taken in such matters here in California, where there is so much need of enterprise, intelligence and improvement in everything pertaining to agriculture.

The weather was very fine during the week, the days delightful, and the nights cool and refreshing. The hotels and carriages were reasonable in charges and accommodating; the regulations in the city and in the Fair were without fault. The pavilion was simply, but beautifully, decorated with evergreens and such ornaments as the ladies who had charge of it know how to arrange. At the race track decorations, with slight exceptions, ruled; and the management and display of stock was good. The management generally reflects credit upon the people of Marysville.

The Exhibition of Fruits

Was good, so far as it went. The show of grapes by H. T. Hutchinson and J. R. Nickerson could scarcely be excelled in any part of the world. The Grass Brothers also made a fine display of leading varieties. Meehan & Tremble exhibited fine specimens of California and Black Hamburg grapes and 15 varieties of peaches.—Mr. Hutchins exhibits 25 varieties. Mr. Nickerson, Mr. Johnson and Mr. J. A. Hall were not much behind. The mountains can beat the valleys in color and flavor, if not in size, of peaches.

PEARS.—California can beat the world in this fruit, of which there were five different displays, containing over 20 varieties.

THE APPLE is a fruit which everybody must have, and there was a great variety on exhibition. Our fruit growers have been trying the different varieties, and are now selecting the best standard sorts, as proven so by experience and comparison. The importance of such selection cannot be over-estimated.

PLUMS.—No country can excel California in growing plums. No eurolio destroys our plum crop, neither does any other insect interfere. The present is the season of the full glory of this fruit, and very good use was made of it. Several varieties of magnificent fresh figs lent their richness to this portion of the exhibition, also sundry plates of delicious pomegranates.

Dried and Preserved Fruits.

This portion of the exhibition was faultless in quality, though less than it should have been in quantity. It is one of the most astonishing things in the world that such quantities of delicious fruit should be suffered to rot upon the ground in this State, while we are sending thousands of miles away to get dried and preserved fruits far inferior in quality to what we might obtain at our very doors.

Miscellaneous.

The display of vegetables was small, but good. Dr. McDaniel, of Marysville, exhibited samples of castor oil, and Mr. Purdy, of Monterey, of sorghum sugar and eyrup. Grain and wool sacks were also shown from the Oakland factory. There was also a small show of nuts, a product which is deserving of far more attention than it is receiving, not so much for the fruit as for the hard wood timber upon which they must be produced. There were several exhibits of silk cocoons, raw and spun silk, and eggs. It is gratifying to see the constantly growing interest that is being taken in this branch of industry.

The display of agricultural implements was quite good and varied; but we have no space to particularize, at this time.

The exhibit of stock was good and well worth examining. The show of blooded sheep was quite full. Some China and Berkshire hogs were also exhibited.

Mining and Company Advt's.

Eagle Quicksilver Mining Co.—Location of Works: Santa Barbara County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 27th day of July, 1870, an assessment of twenty dollars (\$20) per share was levied upon the mines of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at his Office, room No. 26, Haywood's Building, No. 419 California street, San Francisco, California.

Any share upon which said assessment shall remain unpaid on Monday, the 19th day of September, 1870, shall be deemed delinquent, and will be duly advertised on September 24th, for sale at public auction, and unless payment shall be made before, will be sold on Monday, the 26th day of September, 1870, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

T. W. COLBURN, Secretary.

Office, Room No. 26, Haywood's Building, 419 California St., San Francisco, California. July 30.

Owing to the resignation of T. W. Colburn, and election of Wm. H. Watson, as Secretary of said Eagle Quicksilver Mining Company, and the change of the Office of said Company to Room 5, No. 302 Montgomery Street, the above mentioned assessment must hereafter be paid to the said Wm. H. Watson, at the present office of said Company, above stated.

By order of the Board of Trustees.

WM. H. WATSON, Secretary, Office, Room 5, Building No. 302 Montgomery Street, San Francisco, Cal. September 10th, 1870.

Latawana Mining Company—Near Hamilton City, White Pine County, State of Nevada.

NOTICE.—There are delinquent upon the following described stock, on account of assessment levied on the fifteenth day of August, 1870, the several amounts set opposite the names of the respective shareholders, as follows:

E. A. FRIEND & CO. 601 California Street.

Silver Sprout Mining Company.—Location of Works and Mines: Kearsarge District, Inyo County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 29th day of August, 1870, an assessment of twenty-five (25) cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary, at the office of the Company, No. 408 California street, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on the eighteenth day of October, 1870, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Thursday, the first (1st) day of December, 1870, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

T. B. WINGARD, Secretary, Office, 408 California street, San Francisco, Cal.

A NEW BOOK FOR MINERS.

[Issued July 1870.]

ROASTING OF GOLD AND SILVER ORES AND THE EXTRACTION OF THEIR RESPECTIVE METALS WITHOUT QUICKSILVER.

BY G. KUSTEL,

MINING ENGINEER AND METALLURGIST, Author of "Nevada and California Processes of Silver and Gold Extraction," and "Concentration of all kinds of Ores."

CONTENTS:

I. INTRODUCTION. Classification of Ores; Important Silver Ores; Difference between Real Silver Ores and Argentiferous Ores; Important Combinations; Means of Desulphurization; Means of Reduction; Desulphurization of Ores Not Efficient; What a Chloride is, and How Chlorination is Effected; Means of Separating the Metals from Chlorine.

II. ROASTING OF ORES. A. Chloridizing Roasting; Necessary Amounts of Sulphureta; Amount of Salt Used; Permanent Stirring Not Essential; Signs of a Good Chloridizing Roasting; Means of Destroying Base Metal Chlorides; Steam decompose Base Metal Chlorides; Application of Steam in Roasting; Lead has a Bad Influence; Difference in Roasting Processes; In what condition the Metals are after Roasting; Charges in Roasting. B. Oxidizing Roasting; Chemical Changes in Roasting; What Process requires Oxidizing Roasting; Roasting Furnaces; Furnaces managed by Handwork; Reverberatory Furnaces; Single Roasting Furnace; Double Roasting Furnace; Long Roasting Furnace; Muffle Furnace; Furnaces with Mechanical Apparatus; Revolving Hearth Furnace; Ernst's Rotary Furnace; Parke's Furnace; Buckner's Furnace; O'Hara's Chain Furnace; Stetefeldt's Furnace; Chimney and Flues.

III. EXTRACTION OF SILVER BY LIXIVIATION. O. Solving Process; Extraction of Silver; Precipitation of the Silver; Treatment of the Precipitated Silver; Precipitation of Copper; Quality of Ores fit for the Solving Process; Sulphide of Calcium; Hypoaliphite of Lime; Patena Process; Kiss Process; Patena and Roszner Process; Kustel and Hoffmann Process; Angustin Process; Ziervogel Process; The Leaching Process.

IV. EXTRACTION OF GOLD. D. The Chlorination Process (Plattner's); Chlorination of Sulphureta and Arsenureta. This new book on the treatment of gold and silver ores without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of the various processes and apparatus employed in this country and in Europe, and explains the why and wherefore. It contains 142 pages embracing illustrations of furnaces, implements and working apparatus. It is a work of great merit by an author whose reputation is unsurpassed in his speciality. Its price, considering its special character and value, is reasonable and small in comparison to the information so well rendered in its crowded pages. Price \$2.50 coin or \$3 currency, postage free. Printed and Sold by DEWEY & CO., Publishers and Patent Agents, Scientific Press Office, San Francisco.

NEVADA AND CALIFORNIA PROCESSES OF SILVER AND GOLD EXTRACTION, FOR GENERAL USE, AND ESPECIALLY FOR THE MINING PUBLIC OF CALIFORNIA AND NEVADA, With full explanations and directions for all metallurgical operations connected with silver and gold from a preliminary examination of the ores to the final casting of the ingot. Also, a description of the general metallurgy of silver ores.

BY GUIDO KUSTEL, Mining Engineer and Metallurgist, former manager of the Obfir Works, etc.

Containing 350 quarto pages, and illustrated with accurate Lithographic Engravings. 1863, Sold by DEWEY & CO., Publishers SCIENTIFIC PRESS, San Francisco.

As its title indicates, this work gives a wide range of information, applicable to all vein miners and workers in precious metals, affording hints and assistance of exceeding value to both the moderately informed and the most expert operator. Once in hand it is held for trusty reference by the owner and highly recommended to others who do not possess it. Price \$5 (coin) bound in cloth, \$6 bound in leather. Address DEWEY & CO., SCIENTIFIC PRESS Office, San Francisco.

The Best Treatise Published. Concentration of Ores (OF ALL KINDS,) INCLUDING THE CHLORINATION PROCESS FOR GOLD-BEARING SULPHURETS, ARSENURETS, AND GOLD AND SILVER ORES GENERALLY.

By GUIDO KUSTEL, MINING ENGINEER AND METALLURGIST, Author of "Nevada and California Process of Silver and Gold Extraction."

With 120 Lithographic Diagrams.

Published and sold by DEWEY & CO., Publishers SCIENTIFIC PRESS, San Francisco, 1868.

Heads of Table of Contents.

I. INTRODUCTION.—The Dressing; The Separation; Cleansing and sizing Contrivances; Rotary Sizers, etc. II. EXTRACTION.—Reduction of Ores; Description of Batteries; Details of a Battery; Speed, Curves and Order of Lifts; The Discharge of Batteries; The Feeding of Batteries; Reduction by Rolling Mills; Grinding; Pans with Plane Mullers; Pans with Conical Mullers; Pans with Tractory-Conical Mullers; Pans with Perpendicular Mullers. III. CONCENTRATION.—Concentration of Reduced Ores; A Concentration of Ores (Jigging, Stamping, Movable Jiggers; Stationary Jiggers; Continual Jiggers; Rotary Machines; Concentration of Ore Sands; Assorting of Sands; Feeding of Concentrator; Stationary Concentrators; Percussion Table; Oscillating and Shaking Tables; Steady Moving Concentrators. IV. SPECIAL CONCENTRATION.—Concentration of Gold Ores; Concentration of silver Ores; Concentration of Lead and other Ores. V. CHLORINATION.—Extraction of Gold from Sulphureta by chlorination; Assay ditto; Loss of Gold in Roasting; Roasting Furnaces and Operation; Roasting with Salt; Dampening of Roasted ores; Sifting; Production of Chlorine Gas; Lixivation; Precipitating; Precipitation; cost of Process; Remarks; Other methods of Dissolving and Precipitating the Gold from Sulphureta, etc. This work is unequalled by any other published, embracing the subjects treated. Its authority is highly esteemed and regarded by its readers. Containing as it does, much essential information to the Miner, Millman, Metallurgist, and other professional workers in ore and minerals, which cannot be found elsewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. Price, postage paid, \$7.50, in gold or its equivalent.

THE ORDER OF THE DAY.—A general order for Sodom. In the teeth of ALL OPPOSITION it has become the supreme doctrine of the age. No impurity can infect the teeth cleaned daily with SODOMONT. QUILLEY, the bark of the Chilean Soap Tree, an article which possesses cleansing properties superior to those of any other known substance, is one of the ingredients of this peerless compound. SODOMONT is the only dentifrice in existence in which this salubrious botanical product is incorporated.

San Francisco Metal Market.

PRICES FOR INVOICES

ROOT'S PATENT FORCE BLAST ROTARY BLOWER.

MANUFACTURED BY KEEP & BARGION,

At the Globe Iron Works, Stockton, California.

Patented Nov. 1st, 1864; July 24, 1866; and Oct. 9, 1866.

Awarded the First Premium at the Paris Exposition.

ADAPTED FOR Smelting, Foundry, Mining and Steamships.

REQUIRES Fifty Per Cent. LESS POWER Than any Blower Now in use.

One of these Blowers may be seen on exhibition at W. T. Garratt's Brass Foundry, corner of Mission and Fremont street. They are also in use at the Almaden Quicksilver Mine; Gridley's Foundry, Gold Hill, Nevada; Aina Iron Works, San Francisco, and many other places.

CAUTION.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirement of the genuine article.

Quartz, Saw and Grist Mill Irons, Steam Engines, Horse Powers, High and Low Pressure Steam Engines, Steamboats and Propellers, made at short notice.

—SUCH AS—

Lathes, Planers, Drills, Boring Mills, Milling Machines, Etc.,

Which I will offer at very low rates. Also,

MORSE'S TWIST DRILLS, AND CHUCKS OF ALL KINDS.

MANUFACTURER OF

Steam Engines, and Mill Work Generally.

Sole Agent for TAFT'S PATENT SHEARS AND PUNCHES.

ENCOURAGING REMARKS.—One of our readers writes: "Incorporating an agricultural department into your paper has made it acceptable and really useful all over the country west of the Rocky Mountains, and probably further; and for my part I do not see how an intelligent farmer, miner or mechanic can do without it."

IMPORTANT TO CHIEF AND VINEGAR MAKERS.—Wines and Champagne manufacturers, Merchants and Families. Valuable information imparted relative to machinery, improved process for making Wine, Champagne, Cider, Vinegar, etc., also for refining, fermenting, oxygenating, compounding, etc., fully explained in the Cider Maker's Manual and sent free by mail for \$1.50. Address J. S. BUELL, Buffalo, N. Y.

N. B.—Illustrated Circular of Cider Mill Machinery sent free.

10-21-7f

McAFEE, SPIERS & CO., BOILER MAKERS AND GENERAL MACHINISTS,

Howard st, between Fremont and Beale, San Francisco.

Fire or Tubular Boilers, with plain circular or spiral courses. Upright Fire or Tubular Boilers, Locomotive and Marine Boilers, and Wrought Iron Tanks of every description.

Hydraulic Pipe supplied at reasonable rates. In ordering, give the quantity of water to be supplied, height of the fall, and total length of pipe, so as to enable the firm to determine the diameter of the pipe and thickness of iron to be used.

Repairs.—Boilers, Smoke Stacks, Pipes, etc., put in repair with promptness.

To Boiler Makers and Machinists in the Interior.—The firm is prepared to furnish estimates of Boilers, supply new Heads, drilled and punched, and attend to the selection and forwarding of Iron for Boilers, Pipes and other purposes.

Plans, Drawings and Specifications.—The firm is prepared to make out Plans and Specifications, receive estimates, and superintend the Erection of any Machinery that may be entrusted to their care.

To Inventors.—The firm is prepared to assist in developing the plans of those who have the ideas but not the practical experience necessary to put the same in form, by making Drawings of their Inventions, giving them the benefit of their practical knowledge in the construction of Machinery, and attending to the manufacture and introduction of their Inventions.

Sheffield Scientific School

Of Yale College, New Haven, Conn.

This department of Yale College, instituted in 1840, and endowed with the National Land Grant in 1866, furnishes advanced instruction in the various branches of Mathematical, Physical, and Natural Science.

The School is under the direction of the President of the College, a Board of thirteen Professors in different specialities, and six assistant instructors. Regular courses of study, leading to the degree of Bachelor of Philosophy, conferred by Yale College, are arranged as follows: 1—CHEMISTRY and MINERALOGY. 2—CIVIL ENGINEERING. 3—MECHANICAL ENGINEERING. 4—MINING ENGINEERING and METALLURGY. 5—AGRICULTURE. 6—NATURAL HISTORY and GEOLOGY. and 7—SPECIAL COURSE. Advanced students are also admitted to optional courses, and if already College graduates, are received as candidates for the degree of Doctor of Philosophy. Tuition, \$125 per year of forty weeks. The Libraries, Museums, Laboratories and Apparatus accessible to students, are varied and extensive. For copies of the Annual Circular and Report, letters may be addressed to the "Secretary of the Sheffield Scientific School," New Haven, Conn. 7v16-1y16p

VOLUME XXI.
Number 13.

A New Thimble.

We address ourselves more particularly in this article to our lady readers, and we think we have something of interest to show them. We are particularly desirous of pleasing the gentle sex, and like to have them pleased with our modest selves.

When the sewing machins came into vogue, it was expected that the device would lessen to a great degree the work of our female relatives. This expectation, as far as our personal experiences goes, has not been realized. We do not see but what our mothers, wives, sisters and daughters

(it takes the collective editorial force to say all this) are as busy as ever. No doubt very much more is accomplished than was done previously, but there seems to be always as much as ever to do.

The thimble has by no means lost its vocation. It is as indispensable as ever. But "there's odds" in thimbles. They have a good side, but also a dark one. The ordinary article forms a continuous cap for the end of the finger and, when worn a considerable length of time, heats the finger and renders it tender. Indeed, by constant usage, hang-nails are formed, which tear down into the flesh and form bad sores. Our gentle readers will then readily appreciate the benefits of any invention which obviates this difficulty.

Mr. Law, in his thimble here illustrated, cuts away that portion of this article which would otherwise cover the lower part of the finger-nail, where the nail and flesh unite and where hang-nails are apt to be caused to occur. Around the lower rim or open end of the thimble is a clasp spring which is extensible and which clasps the finger below the nail and holds it firmly in place without undue pressure.

Now we think our friends of the needle will find this a preventative for the ills spoken of above, and we recommend them to try it; and if they address themselves, through proper channels, to Mr. Albert H. Law of this city, this patentee, they can obtain as many thimbles as they desire.

A SERIOUS FIRE.—We are sorry to be obliged to record another disastrous fire, at Grass Valley, on the 20th inst. The mill, hoisting works, store houses and some two or three thousand cords of wood, the property of the Empire company on Ophir Hill, were entirely consumed. The powder magazine, containing 150 kegs of powder, was exploded. This is a serious blow to the mining interests of Grass Valley. About 150 men are thus thrown out of employ, and a loss of some \$150,000 results. The insurance is given as for \$80,000.

IMPROVED CARRYING FACILITIES.—It is represented to us that the facilities for transporting bullion, etc., to the interior of Arizona, are entirely inadequate to the demands of the country. Wells, Fargo & Co. carry only to Fort Yuma and La Paz, and from these points people must make the best terms they can with the most reliable parties they can find; and this is not always easy nor safe. While greenbacks are nominally the currency of Arizona, there is not a sufficient supply of these, and it is very inconvenient to parties trading this way to deal in a currency subject to such fluctuations. Many of the miners and millmen are paid in crude bullion which is not convertible

Tilting-Stand for Ice-Pitchers.

To the luxurious American iced water is, at least in many parts of the United States, almost a necessity. While the Englishman is contented with its use in hot weather, and the people of the Continent partake of it only on exceptional occasions, our people regard it as an article to be had the whole year.

But the ice-pitcher, filled with its cool beverage, is so heavy that it is quite an exertion for ladies and children to lift it, and of these the exertion is required the oftenest. Devices for tilting, without lifting, the pitcher have previously been

GIBSON'S PATENT TILTING-STAND FOR ICE-PITCHERS.

into coin, (a rare article there,) and the value of which is, at least, uncertain. We are informed from several parties that at present there is much trouble experienced in the interior of the country on this account. It would certainly appear that the business would pay Wells, Fargo & Co. to extend their lines, and we respectfully submit the matter to that firm for their consideration.

MINERAL LAND SURVEYS.—Parties are already making surveys and subdivisions of mineral lands in Nevada county, under the direction of the U. S. Surveyor General for California. There is quite a general disposition among the miners, it is stated, to avail themselves of the provisions of this law.

THE RAILROAD PARTY.—On Sunday the representatives, eighty in number we are told, of Eastern railroads, arrived in this city. It is hoped that their visit will result beneficially to the interests of both east and west. On their return, they are to attend the Railroad Convention to be held at Chicago.

known, but these all demand that the pitcher should be made expressly to fit the stand. We illustrate to-day a new invention which can be used with vessels of any common form or material.

The base of the stand is of the form shown in the cut, and has, at one end, a recess for the reception of the goblet, and, at the other, one to hold a bowl wherein is caught any water which may drip from the tilted pitcher. On the opposite sides of the central part are standards, to the top of which are pivoted the side-pieces of the frame or basket which holds the pitcher. The bottom of this frame is circular, and in it is placed the pitcher which is securely held in place by a spring-catch acting in conjunction with the projecting rim of the bottom piece. It will be readily understood that very differently shaped vessels for holding water, coffee, tea, etc., etc., may all be used in this stand.

Of course, there is room for an indefinite amount of ornamentation, and where the pitcher is made to match the stand, the whole forms a very handsome article.

By means of this any person may pour out water without an effort and without spilling the liquid on the table or other articles of furniture on which the device may stand. And for pouring out tea or coffee at meals, this will be found very useful and convenient.

Patents for this invention have been granted, in the United States and Europe, to Mr. John Gibson Jr., of New York. Letters for further information will reach this gentleman, if addressed him at to 711 Broadway, Albany, N. Y.

The State University.

The examination of applicants for admission to the University commenced on Wednesday. How many have applied for admission, we know not at the time of writing, but the majority wish to enter the fifth class. We see it stated that probably some 150 students will attend the University next term.

This fifth class is a new thing and is intended as preparatory to the regular course of studies. Candidates for this class must be at least fourteen years of age and pass a satisfactory examination in English Grammar, History of the U. S., Arithmetic and Geography. The Board of Regents, moreover, have passed a resolution looking to the establishment of branches of the class at various localities in the State. As there are no funds on hand to be used for this purpose, all that can be done is to exercise some supervision over such branches, wherever they may be organized by other parties, and give the students thereof some advantages with respect to their admission to the University.

The establishment of this class has provoked some discussion. For our part, we see but little in its favor. We have good preparatory schools, without having a new class incorporated as a part of the University, which is not, or ought not to be, a grammar school for children. We believe in raising, not lowering the standard of such an institution. We believe, moreover, that many of those who enter this class will not continue in the higher classes. Boys of fourteen are not generally able to decide as to their future, and while we think that the greatest amount of education possible should be given to our youth, we do not consider it proper to incorporate such instruction as this, which belongs to this grammar and high schools, in a University. If the Regents are desirous of making the establishment meet the requirements of the State, they will have no trouble in finding a hundred different and better ways. We may add that the Faculty of the University, if our information is correct, objected to this class from the beginning, and even went so far as to send a written protest to the Regents.

The competitive examinations for scholarships are to commence on Friday, after our paper has gone to press. We shall probably have more to say on the subject in our next issue.

Communications.

IN THIS DEPARTMENT we invite the FREE DISCUSSION of all proper subjects—correspondents alone being responsible for the ideas they advance.

Notes of Travel in Placer County.

[CONTINUED FROM PAGE 202.]

The Craig Nozzle.

The Messrs. Craig have been engaged for the past three years in perfecting this invention, and their efforts have resulted in the production of an apparatus for hydraulic mining that, after thorough trial in over a hundred of the most extensive and prominent mines in the State, has received the highest recommendations of experienced miners. The invention consists of a hollow globe or reservoir, in which fits a ball or socket which is provided with an elbow, the globe being cut open on top. The ball revolves entirely round horizontally, and up or down at an angle of about 40 degrees. This play has been found amply sufficient for all ordinary mining purposes and the water, being fed to the discharge pipe from the globe or reservoir, has not the bad effect caused by a short turn in the pipe, like that produced by a common elbow, but causes a perfect stream to emerge at any point to which the nozzle may be directed. As a matter of economy, it not only places the water of 7 or 8 ordinary hose pipes under the control of one man, but its durability is so great (one lasting a life time) that its extra first cost is seldom noticed, it being in convenience alone worth more to the miner than the difference of cost of canvass hose. No canvass being used, it is not liable to breakage under heavy pressure, and saves the annual outlay for canvass, while the concentration of a larger body of water in one column has been found to nearly treble the amount of execution in comparison with ordinary expenses. The Globe Nozzle and its improvements are covered by three different patents, owned by Messrs. Craig, who now have two suits pending in the U. S. Circuit Court against manufacturers and users of alleged infringements thereon. The address of the owners is R. R. & J. Craig, Nevada City, Cal.

Hydraulic Claims.

Messrs. Brogan & Co. cleaned up in 15 days run (just past) \$3,500. The pay dirt here is very easily managed, there being little or no large rock in it. This pay channel extends from Bear river, above Dutch Flat, to the north fork of the American river, below Gold Run, a distance of 5 miles. It is from $\frac{1}{2}$ to 1 mile wide and from 50 to 500 feet deep. Just below the Indiana Hill claims, and next adjoining, are the Indiana Hill Cement Mill Co.'s diggings. They run an 8-stamp mill, and with it crush 35 tons of pay cement per day (24 hours). Alvin Gentry is foreman. Eight men are interested, and they work an average of 20 men; their claim is from 200 to 400 feet wide and 1,600 feet long; the pay about 10 feet deep. In 22 days run, just past, they cleaned up \$2,800 clear of expenses. They have a system of under currents here for saving gold, which I will fully explain hereafter.

Dutch Flat.

Dutch Flat proper is one-half mile east of the railroad station of the same name, and 3 miles east of Gold Run. This district was discovered as far back as 1849 as a placer mining camp. Tunneling was first commenced in 1852, and hydraulic mining first introduced here in 1857. This lead is a portion of the same that extends through several counties east and west. The main lead is about 2,000 feet wide, until it reaches the Dutch Flat Ravine, when it widens (as before mentioned at Gold Run). It averages 300 feet deep to the bed rock, from 70 to 100 feet of which have already been mined off; but in no place has the bed rock been reached (save by shaft) except a small portion of Thompson Hill, which has been drilled to bed rock, and which is the extreme west portion of the lead. The channel lies in the shape of a horse shoe. The principal owners of these claims are: James Teaff, who owns about 40 acres; J. S. Colgrove & Co., who own from 40 to 45 acres, and Bradley & Kelsey, owning from 20 to 30 acres of the main lead. The latter only are at present working. The portion they are on is very strongly cemented. They drift or tunnel into a bank—200 feet high—some 75 or 100 feet, then cut chambers right and left, fill the cavity with from 50 to 100 kegs of powder, and then throw it off. The result is that an immense bank of pay-dirt is thrown down, thoroughly broken up, so as to be easily washed. In the claims of Jas. Teaff, one shaft is sunk to bed rock, 220 feet from the original surface, and prospects from 2 to 3 cents to the pan from the top down; he also has a very extensive tunnel (the longest sluice tunnel in the State, 2,200 feet, cost \$50,000,) which drains the claims as far down as worked. I understand that this claim is now in the English market for sale and is held at fabulous figures; something like a quarter of a million dollars. J. S. Colgrove & Co. have a shaft down to the bed rock in their claims, 196 feet from the present surface, and about 275 feet from the original. To give an idea of the amount of work that has been done here, you can look over an area of 2,000 acres that has been washed down from 50 to 75 feet over its entire face; and in no instance, I am informed, has it failed to pay wages. Capital is necessary to run bed rock tun-

nels and otherwise successfully work these claims, which the present proprietors (at least a majority of them) have not got. Their water privileges are very good;—3 large ditches, of the South Yuba Co., the Dutch Flat Co., and the Miners Ditch Co. These furnish about 7,000 inches of water at present, and have a capacity of furnishing about twice that amount by the system of reservoirs. The average pay of these hydraulic claims was, when working from 5 to 7 men, with from 200 to 400 inches of water, from \$100 to \$300 per day, or about \$140 per day clear of expenses, or about \$20 per day clear to the man.

The Eureka Hair Co.

This manufactory, the only one of the kind on the Coast, I believe, is situated $\frac{1}{2}$ miles from Dutch Flat. The hair is made from "Soap Root," gathered by Chinamen, under contract, for from \$30 to \$35 per ton delivered. To give a minute description of this Company's works and the process of manufacturing would require a full column article. I will state, however, that the machinery is run by water power, was first built in 1866, burnt down last Fall, and was immediately re-built at a cost of about \$6,000. About 360 tons of the raw material are used up annually—yielding 240 tons of a 2nd quality of hair, worth 9 cents per lb.; or, by extra washing, a first quality of hair is produced, which, from 360 tons, would net about 200 tons, worth 13 cents per lb. The process was patented Jan. 15th, 1867. L. P. Mc.

From Utah Territory.

[Continued from page 202.]
President Brigham Young.

The private residence of most interest to the stranger is that of President Brigham Young. This is on the square next to Temple square and is surrounded on all sides by a high crenel wall. In this area of about ten acres, where the emblem of the eagle and the bee-hive is to be seen, are, besides the President's home and private school house for the family, all the central business offices of the church and state, the stables and warehouses of the establishment, and gardens rich with fruits and flowers.

I had the pleasure of meeting and enjoying the hospitality of this remarkable man. He was born, I believe, in Vermont, in 1801, and is now in his 70th year. Although he has passed through and held a prominent part in so many scenes, he is still hale and hearty. In 1847, he led the pioneer band of 143 from the Missouri to the Rocky mountains and brought them to this place to settle. There being then no organized government in this territory, which belonged to Mexico, a provisional government was formed, with the title of Desert, and he was elected governor. When the land was ceded to the U. S. in October, 1850, Mr. Young was appointed governor of the territory.

That President Young has been the leading spirit in this territory, is everywhere known. He has taken part in all public improvements, not refusing to work often with his own hands. He has been active in opening communications to the east and west, formed express companies and stage lines, built some few hundred miles of the Western Union Telegraph, graded 450 miles of the U. P. R. R., is President of the Utah Central, and has done manifold extra duties in addition to those devolving on him as head of the Church. He receives many visitors and is quiet, gentlemanly and hospitable in his deportment. He still shows a most energetic spirit, notwithstanding his years, and is deservedly one of the most prominent men of the age.

The Mines.

Utah makes quite a show in the way of minerals. Iron ore is known to exist in several places in large amounts. In Iron county, works were built in 1852 and a small quantity of ore was smelted, but want of proper fuel compelled a suspension of operations. The Union Iron company, previously spoken of, had two furnaces in operation in January, 1869, and one in the course of construction. Coal has been found in quite extensive beds, but principally in the neighborhood of Chalville, Summit county. Copper, lead, silver, zinc and sulphur occur, and different sorts of building stone abound.

The mines at the Little and the Big Cottonwood cañons, 28 miles southeast of Salt Lake City, are the centre of the present mining excitement. Communication is had with these places by a stage which runs three times a week.

The largest mine at Little Cottonwood is the Emma ledge, located in August, 1868, and owned by the Walter Bros., J. F. Woodman and others. In July, 31 car loads of ore were shipped from the ledge, and that month upwards of \$3,000 were paid for haulage. The cost of transportation (by team to Salt Lake City and thence by rail) to New Jersey and the expenses of treatment amount to \$90 per ton, but the ore sent averages, I am told, nearly \$2.00 per ton. There are 20 men employed here extracting the rock, of which some 15 tons are obtained daily. A tunnel is being run in to tap the main shaft, which is down about two hundred feet. I send you a specimen of the ore. There are other promising locations here, as the North Star, owned by Bruno & Co., and the Western State, which takes out some twenty tons weekly.

Not far off, over the ridge, is Big Cottonwood-

cañon. Here the Empire Tunnel company propose to run a tunnel in towards Little Cottonwood. Here are also the Wellington, Theresa, Davenport and other leads. The general formation is limestone.

Mr. C. L. Stevenson, who has lately visited the various mining districts, gives me the following approximate product of the different mining localities during the month of July. The average value of ore exported was about \$105 per ton.

Little Cottonwood,	314 tons,
Bingham,	6 "
Parley's Park,	40 "
Brush Valley,	70 "
Deep Creek,	10 "
Tintic,	30 "
Total,	470 tons.

Smelting Works.

Messrs. Woodhull Brothers have built a furnace here and have made the first run of this territory. This run created, naturally, considerable excitement here. The result was a production of five thousand pounds of bullion in 36 hours. This assays about \$500 to the ton in silver. The metal was hauled to town and stocked up in front of the Elephant store, where it attracted large numbers of people who were curious to see the pioneer bars of Utah. The Woodhull works are capable of working about ten tons daily.

Mr. Milton Robbins is about to put up smelting works. He will have the able assistance of Mr. Chas. C. Ruegar, who will take the active management and the construction of the furnaces in hand. Mr. Ruegar has studied in Germany and has spent considerable time among the mines of California. He appears to be well fitted for his work.

Mr. Leopold Balbach, a cousin of the Balbach Brothers of Newark, N. J., has been visiting the mines of Utah and was so impressed with their extent and richness that he telegraphed to parties East, (he tells me) that he thinks best to erect smelting works in the Valley; and these are to be put up.

There are others here who engage in buying ores, and the mines are attracting persons from different quarters. There seems to be every reason to suppose that Utah contains valuable mineral deposits, and probably these will be developed quite extensively henceforth.

W. H. M.

Salt Lake City, August, 1870.

The Auburn Mill, Reno, Nev.

[Written for the Scientific Press.]

Your correspondent visited the Auburn Mill, located about $\frac{1}{2}$ miles from the C. P. R. R. depot at Reno, Nevada. This was originally built to work rock from a lead near by, which did not prove profitable, however, and was abandoned. It is being run at present on rock received from various points on the line of the railroad. The proprietors are purchasing large quantities of ore. A large ditch, three miles in length, conducts water from the Truckee river to an overshot wheel, 32 feet in diameter by 18 feet breast, which drives all the machinery. Mr. J. J. Danno, the manager, kindly conducted me through the works.

The mill is situated on the side of a hill which gives sufficient fall for one set of machinery to discharge into the other. A rock crusher discharges the ore upon plates, (warmed by waste heat from the furnace) where it is mixed with a proper quantity of salt and dried. It is then fed into a battery of twenty stamps and crushed dry. The dust is conducted from below the screens by an endless chain apparatus to elevators that discharge it into a perforated plate on the top of a stack or chimney 30 feet high by 5 feet square at the bottom,—the shaft of a Steffelt furnace which has been fully described in the PRESS of Dec. 11, 1869. The heated air from the furnace passes under the plates below the rock breaker, thence through an inclined dust chamber, five feet square, up the hill perhaps 75 feet, and terminates in a chimney whose top is 25 feet above the top of the furnace shaft. The chloridized ore is amalgamated in 12 Wheeler pans, whose sides are lined with $\frac{1}{2}$ inch wooden staves, to prevent the iron from being eaten up by the pulp; the miller is not let down heavy on the dies, it not being necessary to grind after roasting. The pans discharge into six separators. The company have rooms fitted up in the most complete manner for retorting, assaying, etc. They design constructing a side track from the C. P. R. R., in a short time, which will enable them to run the cars into the mill. Mr. Brown, the Supt. of the works, claims that this furnace saves 4 per cent of salt, and that the amount of work that required 36 men and 12 cords of wood by the old process, is done by this with 8 men and $2\frac{1}{2}$ cords of wood.

I have met quite a number of miners and millmen, who speak very favorably of the results from ores worked at this establishment,—among others, Mr. D. R. Stewart, Superintendent of one of the silver mines of Unionville, Humboldt Co., Nev. Several tell me that they have previously shipped their high grade ores to San Francisco but of late they have had considerable work at Reno and have obtained decidedly better results; and hence have determined to have all their high grade rock worked there. The San Francisco dealers will have to look out or they will lose this tough ore trade.

L. M.

The White Pine Smelters and the Mining Interest.

Editors Press:—Since my last communication, regarding the smelting business here, a great change has taken place, one detrimental to the prosperity and permanency of this camp—more especially that portion of it called the Base Range. Every furnace in the district has ceased operations, and there is no certainty of a resumption of work by any of them. To what causes can be assigned this sudden stoppage? Plainly enough to those who are here, but one cause is prominent, namely, a lack of capital to carry on the business even long enough to allow time for returns from bullion to arrive. Only three furnace proprietors out of more than twenty that have operated, have even paid for the ore which they have received from the miners. Some of the furnace men, after accumulating large stocks of silver-lead bars, have shipped them away to Newark or San Francisco, and then followed them to obtain the returns, leaving the miners and operatives to whistle for their pay and keep their courage up in the same manner.

The prices paid for ore have always been low enough in all conscience, leaving a large margin of profit to the smelter, without the necessity of running away with all the proceeds. Indeed, as I wrote you in my last, so little inducements have the miners received to work their mines, that the Base Range has been and is now almost wholly deserted. Yet it is not by any means unprofitable to the smelter to work these ores, even after paying fair prices to the miners. The fact that so many have rushed into it, and built furnaces of varying capacity and cost, shows that large profits were expected. Even now, the largest enterprise of the kind yet attempted is being effected at Hamilton by Ex-Governor Matteson, of Illinois, and his associates. Three large cupolas are being erected, with a forced blast by means of an engine of 40 horse power; and five roasting kilns also, to prepare the ores for the furnaces. The boilers, engine, blower, and refining furnaces, are all of Chicago manufacture. The works are all enclosed in a substantial stone building. Separation will be performed here, both of the metal produced, and of all that may be brought from other furnaces. The works occupy a whole block of ground, and there are four blocks in all belonging to the Company. A never-failing spring upon the property has been converted into a reservoir which supplies the building and boilers with an abundance of water. The total cost of these smelting and refining works cannot be much short of \$50,000. The Company have a large capital and it seems to be their determination to "push things." All which will be very acceptable to the mining interest, if they do not push the miner to the wall.

As to this latter contingency, although there are but few left to be the subjects of it, I must say that the managers have made a bad beginning. They insist upon the delivery of ore at the furnaces by the miners, at their own cost. The managers then procure an assay to be made of samples of the ore and afterwards affix their own valuation upon the various lots so brought to them. If the miner is not satisfied, he has the alternative of earling away his ore again at his own expense. All this is very vexatious, and the miners are already making up their minds to abandon the district, unless there is a change. About one thousand tons of ore have so far been thus purchased from them, and the proprietors have now resorted to advertising for more.

MINER.

[TO BE CONTINUED.]

Good.—The Vallejo Recorder says that the employés of the Central Pacific Railroad, who become sick or crippled, have all the comforts of a home in an asylum at Sacramento, in which they have a share. It is conducted thus: Each employé of the company pays into the Asylum Fund fifty cents per month, and if he is disabled so as to be unable to work, he is cared for as well as if at home—enjoying luxuries and comforts. A movement, we believe, is on foot among the mechanics of this region to establish a similar institution. We learn there is from time to time quite a drain on the pockets of the employés of Mare Island for charitable purposes, and it would, no doubt, be to their advantage, in every respect, to encourage this project. Probably a lot would be donated, and then it would cost but little for a house and outfit for disabled mechanics.

PREVENTION OF BOILER INCORUSTATION.—A very simple mode of preventing boiler incrustation is in general use at the Darmstadt Gas Works. The engine has worked night and day since 1854, almost without interruption, and the formation of calcareous deposits has been entirely prevented by the use of crude pyrolineous acid, combined with tar; it is either introduced into the boiler or mixed with the feed water. Since this mixture has been in use they have never had to use a hammer to remove scale. Each year, during the summer, when less gas is required, the boiler is opened, and perhaps a couple of handfulls of loose sediment taken from the bottom. The quantity employed is very small—just enough to redden litmus paper; consequently the iron is not attacked, as indeed is apparent from the fact that the boiler has been but twice under repair.—*Gas Light Journal.*

Mechanical Progress.

THE TROY BESSEMER WORKS.—The N. Y. *Engineering and Mining Journal* has an interesting account of a Bessemer "heat," recently witnessed by the editor at the Works in Troy, N. Y. We give a brief abstract. This Bessemer product is really not steel at all, but "a very pure homogeneous, somewhat highly carbonized wrought iron." It is true that the introduction of ferro-manganese, or *spiegeleisen*, at the conclusion of the heat, does re-introduce a small amount of carbon, but not enough to entitle the product to the name of steel. It is, however, far better than steel, for many purposes, and especially for rails. The process does not differ essentially in chemical reactions, from the puddling process. But in the latter, the fluidity of the metal decreases as the carbon burns out of it; it coagulates in lumps "like butter in a churn;" homogeneity is impossible. "The Bessemer process effects both mechanical stirring, and the chemical purification, by the agency of a powerful blast of air through numerous small perforations in the bottom of the converter;" maintaining also thereby a temperature (sometimes as high as 5000 Fah.) which secures extreme fluidity throughout. The converter is a huge pear shaped iron vessel, 14½ feet high and 9 feet in diameter at the middle, lined with refractory material a foot thick, and supported by trunnions upon which it can be revolved by hydraulic power. The trunnions are hollow, for the introduction of the blast, which is led downward by a rib-like passage outside, and escapes inside by ten dozen ¾ inch holes, arranged in groups. This converter, having been heated up by a fire within, is tilted, emptied, and turned upon its side. The open mouth in its sidewise neck is thus presented to a trough leading from the cupola furnace, and five tons of melted pig-iron run into it. The blast is then let on, and the vessel is swung back to a vertical position. For fifteen or twenty minutes the flames roar and dazzle. This suddenly ceases; why, is yet a puzzle to chemists, for there is still more or less carbon left for fuel. The blast is stopped, the vessel is turned upon its side, and six hundred pounds of melted *spiegeleisen* poured in. "The reaction is instant and violent. The manganese of the *spiegeleisen* combines with any sulphur that may remain in the bath, forming compounds which pass into the slag. It also decomposes in the slag silicates of iron, taking the place of the iron, and returning it to the bath. Finally the carbon and manganese together reduce the oxide of iron which is formed during blowing, and which would destroy the malleability of the product." This takes but a moment. The "heat" is over. The converter is again tilted and discharged into an immense ladle, brought into place by a gigantic crane. This is then swung over the moulds, into which its contents are drawn off through a tap-hole in the bottom. The works produce from ten to twelve hundred tons of ingots per month; nearly twice as much as an English plant of the same size, owing to the improvements and improved arrangements planned by Mr. Holley the manager.

PORT LEYDEN IRON WORKS.—The *Tribune* of Sept. 5th says:—These works were started a few years ago in Lewis county above Utica, on some \$500,000 invested, and were a failure, as pig iron could not be produced from the ore. "Professor Seymour" has recently taken hold of the matter, and now produces steel at one fusion. "The ore is crushed to the fineness of rifle powder. It is then thrown into a revolving cylinder, in which are set numerous magnets. The ore is 'magnetic.' By an arrangement of small brushes, the metallic particles are separated from the refuse. The application of certain chemicals and fusion by charcoal are the next steps, and the product is pure steel, ready for moulding into 'ingots.' Specimens manufactured into finely tempered table cutlery, and the certificate of a well known cutler of Brooklyn, who made the articles, that it is as good steel as he ever worked, have been exhibited. The estimated cost of this steel is less than four cents per pound."

NOTE FOR PHOTOGRAPHERS.—The drying of the collodion film often causes great inconvenience. "I avoid this difficulty," says M. Lecourt, "by placing a very little distance before the sensitized plate a second plate, thin, and perfectly clean; I thus maintain the moisture during a sufficient space of time for any exposure whatever, be it an hour or more, without any apparent drying."

CENTRALIZING MOTIVE POWER.—J. Richards, M. E., in the Sept. number of the *Journal of the Franklin Institute* says:—"May we not look for the next great innovation in motive power to consist in centralizing it and distributing it by means of pneumatic apparatus? The difference in cost of generating 1000 horse-power by a single condensing engine, favorably located, when contrasted with the cost of producing the same power with forty non-condensing engines with 25 horse-power each, is as two to one. * * With a 'pneumatic main' laid through the streets of our manufacturing districts, and each manufacturer taking off his power through a meter, we would gain not only in economy and convenience over local steam power, but obviate nearly all that is objectionable in it. The danger from boiler explosions would be gone. The smoke from steam furnaces would be avoided, the heat and danger from fire would be avoided. The room would be saved, the water rate would be saved. The engine would not freeze in the winter. The cost would be as the amount of power used, which could be varied with the state of business; or a change in the capacity of the motive power could be made at a trifling cost."

ANOTHER MITRAILLER.—The English Government is experimenting at Shoeburyness with a gun of this kind, invented by Major Fosberry, which consists of a compound barrel, composed of thirty-seven rifled tubes of the size of Enfield rifle barrel, hexagonal on the outside, and thus closely fitted together, the whole being enclosed in an iron cylinder. The breech block, containing 37 strikers, each actuated by a spiral spring, is drawn back for loading, and a plate containing the cartridges is inserted vertically. The block is then pressed forward by a lever, forcing the cartridges into the barrels, and at the same time putting the springs in tension. In firing, these springs are released by a lever. The machine is mounted on a field carriage.

IRREGULAR MOLDING MACHINE.—The *Iron Age* says that A. S. & J. Gear & Co., of Boston, have brought out a new machine, that moulds, planes and panels all kinds of irregular finish on the face of lumber. It also does all kinds of dovetailing. It makes both mortise and tenon at one operation. The Messrs. Gear completely revolutionized the manufacture of furniture with their variety machine, and every kind of molded crook and sweep seen upon the edges of lumber—on furniture, sewing machine cases, railroad cars, and house finish—has been done by it.

PROPORTIONAL COMPASSES.—An exchange describes a compass with two long and two short arms, so proportioned to each other that the distance between the former gives the length of the circumference of the circle whose diameter is measured by the distance between the latter. This is an instrument useful to many artisans. Thus, to mark the width of tin plate necessary for a tube of a given diameter, it is only necessary to lay off that diameter with the short arms, and the long ones give the width of plate desired.

THE BROWN PROCESS OF GAS-MANUFACTURE.—This converts hydrocarbons into a fixed gas by a new method—that is, the naphtha is placed in a still where a low heat is applied, until it is converted into a vapor. This vapor is introduced through pipes into a retort, heated to a red heat; where it is entirely and instantly converted into a fixed gas, of remarkable purity and high candle power. Other materials can be used besides naphtha. Any oily or fatty matter may be used. It is necessary, where the materials do not vaporize by the application of a steam coil, to apply heat through a furnace.—*Gas-Light Journal*.

NEW POWER.—"Two Cincinnati machinists have patented a new power in mechanics. A furnace is placed at end of a heavy iron tube, which acts as a flue, and is expanded by the heat. The expansion acts upon a lever of heavier metal than the tube, and as the latter becomes heated, the lever moves slowly but powerfully backward and forward, and this motion, once secured, is repeated at will by the application of cog wheels. The supply of heat to the tube is regulated by side flues, which carry off superfluous heat, or leave all the furnace produces for application to the generating tube, at the will of the operator."—*Iron Age*.

Scientific Progress.

NEW CHEMICAL RELATIONS OF SILICA.—Fidel and Laeburg recently announced to the Academy certain new organic compounds containing silicon, among which was what they called *silicopropionic acid*, containing in its constitution, with silicon and hydrogen, the organic radical *ethyle*. They say it "much resembles silicic acid, but is easily distinguished by its combustibility, burning like tinder when heated." It is insoluble in water, but readily soluble in warm concentrated potash. It appears to be a feeble acid analogous to silicic acid, and "is in fact, the first carburetted silicic acid." The authors say that "it constitutes one term of a series of homologous acids," of which others will be obtainable by like processes. Dumas, in commenting on this paper, throw out the conjecture that as "there are so often found in nature silicious matters, containing traces more or less visible, of organic matter, it would not be surprising that, just as at times natural compound ammonias have been confounded with ordinary ammonia, so compound silicas, in nature, may have been regarded as ordinary silica. In response to this came a communication from PAUL THENARD, of a most striking character, being the announcement of the discovery that certain modifications of the substances of the humic acid group have the power to dissolve silica in large quantity. These new silicious solvents are produced by fixing ammonia upon the humic matters, in ways not yet explained, by which the ammonia is not merely combined as a salt, but enters into the molecular constitution. He has thus formed four distinct derivatives of the humic type, which are not alkaline but acid, and he calls them *acides azhumiques*, which we must render into English as *nitrohumic acids*. Their fixity is remarkable, as they do not wholly lose their nitrogen at 1000 deg. to 1200 deg. They combine with silica to new acids, *siliconitrohumic acids*, which are instantly dissolved by alkalies, including ammonia, even when very weak, forming salts, from which the siliconitrohumic acids may be recovered in all this integrity. The proportion of silica taken up is in proportion to the amount of nitrogen present, varying from 7.5 to 24 per cent. A new relation is here indicated between silicon and nitrogen. THENARD finds these nitrohumic acids in soils, and attributes the silica always found in solutions of the acids of soils to this cause.

Prof. Henry Wurtz, from whose *Chemical Experiments* we take the above, remarks upon it as follows:—"We have demonstrated thus, at once, a theory, not only of new relations of plant decay to plant nutrition, but also of the far broader subject of the transformation and migration of silica throughout all past geological ages, and of the continual, and (as the writer of this abstract has long believed) sole agency of LIFE in these, as in the past and present migrations and transformations of carbon."

POST-TERTIARY IN MICHIGAN.—Prof. Winchell, State Geologist of Michigan, read a paper upon this subject at the late meeting of the American Association for the Advancement of Science. He showed that the peat-beds are the sediment of ancient lakelets. This sediment encloses vast mastodon and mammoth remains, found so near the surface, that it would seem that they must have been buried there within five hundred years. The remains of the gigantic extinct beaver of North America have, within a short time, been unearthed in Michigan. The flint arrow head discovery was made in Washtenaw county, within seven feet of the surface, and the mastodon remains were found near Tecumseh, a few miles distant, but two and a half feet from the surface; the Adrian mastodon, but three feet deep. The bog iron ore in one county covers several townships and penetrates to an undiscovered depth. It is of remarkable purity and lies directly in the projected line of the Northern Pacific Railroad. This prodigious deposit is derived from the disintegration of the hematites and magnetites of the West.

MOUNT WASHINGTON IN THE WINTER.—Prof. Huntington, Assistant State Geologist of New Hampshire, proposes to spend the next winter upon the summit of Mt. Washington. The party will be furnished with instruments for scientific observations, and will be connected with the rest of the world by a telegraphic cable.

HETEROGENY.—The following is an extract from an article by G. Bentham, in *Nature*, on "The Progress of Botany in 1869":—"In all organized beings which in their earlier stages are appreciable through our instruments, every individual has been proven to have proceeded in some stage or another from a similarly organized parent. But there are cases where living beings, Vibrios, Bacteria, &c., first appear under the microscope in a fully formed state, in decaying organic substances in which no presence of a parent could be detected or supposed. Three different theories have been put forward to account for their presence: first, that they are suddenly created out of nothing, or out of purely inorganic elements, which is perhaps the true meaning disguised under the name of spontaneous generation, a theory not susceptible of argument, and therefore rejected by most naturalists as absurd; secondly, that they are the result of the transformation of the particles of the organic substances in which they are found, without any action of parent Vibrios or Bacteria; and this appears to be what is specially termed Heterogeny; thirdly, that there existed in these organic substances germs which had proceeded from parent Vibrios and Bacteria, but too minute for optical appreciation, and that their generation was therefore normal. The supporters of Heterogeny rely upon the impossibility of accounting for the appearance of the Vibrios and Bacteria in any other manner; for they say that although you treat the medium by heat in a hermetically closed vessel in such a manner as to destroy all germs and to intercept all access, still these beings appear. Their opponents deny, if the experiments are conducted with proper care. So it was seven years ago, and so it is still, although the experiments have been frequently repeated in this country, in France, and in North America, almost always with varying results. All reasoning by analogy is still in favor of reproduction from a parent; but Heterogeny has of late acquired partisans, especially in Germany, among those who are prepared to break down the barriers which separate living beings from inorganic bodies."

ALL FORCE IS WILL FORCE.—"If, therefore, we have traced one force, however minute, to an origin in our own WILL, while we have no knowledge of any other primary cause of force, it does not seem an improbable conclusion that all force may be will force; and thus, that the whole universe is not merely dependent on, but actually is, the WILL of higher intelligences or of one Supreme Intelligence."—Wallace on Nat. Selection.

CHLOROFORMING PLANTS.—According to Jourdain, the irritability of the stems in the barberry is suspended by chloroform. A hit of cotton sprinkled with chloroform, and introduced into the glass bell-glass which covered the plant operated on, produced tetanic rigidity of the filaments in one minute; but exposure to the air soon restored the irritability, unless the action of the chloroform had been continued ten or twelve minutes, in which case the vitality of the flowers was greatly impaired or destroyed.—*Academy*.

FOSSIL TOOTH FROM TABLE MOUNTAIN.—Prof. Wm. P. Blske, in a communication to the *American Journal of Science and Arts*, which appears in the September number, says he has compared the fossil tooth found by Mr. Hughes in Table Mountain, with specimens in the Smithsonian Institution, and finds it to be a molar of an animal of the genus *Hipparion*, one of the links between the *Paleotherium* and the horse. He remarks:—"This fossil is the first of the kind discovered west of the Rocky Mountains. It adds to the list of the fauna of the period antedating Table Mountain—a list which includes the mammoth (*Elephas*, from Knight's Ferry), the rhinoceros, and an animal allied to the elk. I have believed that remains of man were also found under the lava; but upon this point, after diligent inquiry, I am satisfied that the evidence is insufficient. But we now add this fossil allied to *Hipparion*, and I regard it as another indication that the Table Mountain beds are Pliocene, and homotaxial with those of the Bad Lands of Nebraska."

A NEW ASTEROID.—Dr. C. H. F. Peters sends the editors of *Silliman's Journal* the notes of the first observations made upon an asteroid discovered by him at the Litchfield Observatory of Hamilton College, Clinton, N. Y., Aug. 14th. This is the 111th of the group.

Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

California.

ALPINE COUNTY.

TARSHISH.—*Miner*, Sept. 10th: A body of very rich ore was struck in the lower tunnel on Wednesday. Guns were fired, the town flag was hoisted, and lager was free. This soft ore is easily concentrated into "sack sulphurets" worth 75 cents per pound.

LEVIATHAN.—For supplying Birdsall & Co. of Dayton with three hundred tons ore, a road survey will be made. It is said the ore will net \$50 per ton on the dump.

AIR PIPE has been put in the No. 3 tunnel of the M. & N. W. Co., and running along the casing commenced. Prospects are favorable.

BUTTE COUNTY.

WHITE ROCK.—*Oroville Record*, 17th: The wing dam of Nisson & Co., is paying well. On Sunday they took out 26 ounces. The have but a small claim dried, but their dirt is very rich.

CALAVERAS COUNTY.

GRAVEL MINING.—*Chronicle*, Sept. 17th: Paul & Co., near the Junction, have struck very rich gravel. A recent clean up, of five days' work, resulted in fifty ounces of dust. The Harkins mine near Central Hill, the richest in the county, continues to pay as well as formerly. Incline Tunnel is in three hundred and sixty feet and expects to reach the lead in a few days. In Chili Gulch the hydraulic claim owned by Mr. Shaw is the most notable. Operations are on an extended scale and the product of gold is large. Brackett & Co. are doing well. The gold is principally in cement, extremely hard, which has to be crushed before washing. A battery of five stamps is constantly running. At Sport Hill and Tunnel Ridge, Johnson, Wolters & Co., Blake & Co., Moser & Fields and others are employed with fair results. The Union Shaft boys continue to make the old diggings pay. Corral Flat isn't fairly prospected yet. Kelton's river claim, at Big Bar, shows \$100 per day average yield. In the Buckeye district, Markwood & Co., Smith & Co. and others are making good wages.

INYO COUNTY.
CERRO GORDO.—*Independent*, 12th: On the 7th, the new smelting works of V. Baudey, at Cerro Gordo, fired up. About five tons of lead ore to one of rich silver ore charged per 24 hours. The cupola will be ready when the castings arrive.

DEEP SPRING VALLEY.—The Co. are settling up their affairs preparatory to resuming business as soon as machinery belonging to Paul's process arrives. Judge Wayland is working ore by the patio process. S. P. Davis is working rich ore by nearly the same process, making use of Indians to tramp the pulp. Mr. Gilmore, of the Chrysopolis mines, has made extensive purchases of mining property from the Berger Bros.

KERN COUNTY.
JOE WALKER MINE.—*Los Angeles News*, 17th: A clean up, after twenty days' run of the mill, was made last week. The result was \$7,000 of retorted gold.

LASSEN COUNTY.
BIG VALLEY.—*Yreka Journal*, 14th: The claim of Ehlers, Haskin & Co. pays about \$250 per day. Dr. Moore saw them take out \$400 in one day, and as much as \$100 to \$175 in a single pan of dirt. Owing to the great scarcity of water, it is hard work to mine either with a rocker or any other apparatus, and as for prospecting, it is useless to try it except in winter.

NEVADA COUNTY.
STILES.—*Gazette*, 16th: W. C. Stiles will commence crushing rock from the ledge at his hoisting works next week. From this date he can take out twenty tons daily—enough to keep his mill running night and day.

MEADOW LAKE.—*Transcript*, 14th: The mining prospects are more encouraging than at any time since Summit City was in full blast. At Carlile, J. E. Squire is getting along well with the new works on the Grant mine. The foundations are laid for a fifteen stamp mill, which will be running in a month. Mr. Culverson has charge of the Reduction Works mill at Ossaville. He will begin in a week to work ore from the Excelsior lode, formerly called the Dutch Flat claims. The Excelsior mill is being hauled out to be stored at Alta. A considerable amount of prospecting is being done.

EUREKA MINE.—*Grass Valley Union*, 15th: The sixth level is 730 feet down, and running in splendid rock. The same drift to the east is also in greatly improved

rock. The clean up of the amalgamators, for twelve days ending Saturday, gave a trifle over \$28,000. This includes nothing from the sulphurets.

STRUCK IT AGAIN.—Same of 18th: About the first of March, Webster & Co., on Randolph Hill, struck a crevice of very rich gravel. The crevice proved small, and was soon exhausted. The Co. then commenced to drift for the regular channel. A tunnel was run on the bed rock 300 feet. The rock then began to dip, the tunnel keeping on. On Friday a shaft was sunk to the rock and a splendid prospect found.

PLACER COUNTY.

RICH.—*Herald*, 17th: Within a few days a Mr. Graves purchased an interest in the old Peterman claims, about a mile from here and went to work. On Wednesday Graves struck some quartz, which has rather waked up our town. A gentleman tells us that the ledge has been opened on the surface for fifty feet, and shows equally rich for the whole distance. Our informant says that with a hand-mortal he could take out big money at any point opened. Some of the quartz has been brought to town which would yield fully \$10 to the pound.

SHIPLEY LEDGE.—The Westchester mill is being moved to this ledge from Brnshy Cañon, near Forest Hill, where it has stood idle for some years. It will be run by water power. The ledge is opening finely. Half the mill is given by Mr. Sears, the owner, for half the mine.

SAN BERNARDINO COUNTY.

CLARKE AND YELLOW PINE.—*Guardian*, Sept. 10th: On Tuesday I. H. Levy, agent for mining companies in Clarke and Yellow Pine Districts, received forty one sacks of rich ore, and forwarded the same to San Francisco.

Messrs. Thompson & Short have brought in specimens of silver ore from a point some 75 miles from here, which looks richer even than that from Yellow Pine. They report large veins, and plenty of wood and water. They found also a large vein of anthracite coal.

SAN DIEGO COUNTY.

THE STONEWALL JACKSON.—*Union*, 15th: Capt. Frary is getting on with the mill, and it will be running in fifteen days. The Company have 100 tons of rock on top of the ground that will pay \$30 to the ton.

BULLION.—A. Pauly & Sons have received one hundred and fifty-five ounces of gold bullion from the mills of Julian District during the week.

SHASTA COUNTY.

SALE OF THE CHICAGO.—*Courier*, 17th: We learn that a company of new comers have purchased the Chicago mine near Piety Hill, and gone to work upon it in earnest. Undoubtedly the developments will induce a general resumption of work on the ledges of South Fork.

SIERRA COUNTY.

SIERRA CITY.—*Messenger*, 17th: The Phoenix Mill is running. The rock is thickly streaked with gold, yielding \$30 per ton. It costs two dollars per ton to haul the ore, and four for crushing. This is a fair stamp mill.

Parties prospecting on the South Fork, above the city have struck good pay gravel. They have a tunnel one hundred feet into blue cement. In a shaft about a mile away, 90 feet deep, 30 feet is in similar cement.

ITEMS.—Part of the Alaska Mine at Pike City has changed hands, and a mill will probably be erected. H. Taher at Gibeonville has completed his air shaft, and the prospects are good. The Bald Mountain tunnel, at Forest City makes twenty feet a week, in hard rock. Mr. Hibbard and others have struck a rich quartz ledge two miles up the East Fork. They brought to town some fine specimens. J. White & Co. at Goodyear's Bar, took out \$1,500 last week.

INDIAN HILL.—Cor. of same: Our gold product has been more than usually good. Jones & Co. made two runs, and are now cleaning up the ravine. The grin that Bill wears shows that his pockets are not empty. Charlton's old Co. have very rich gravel in the centre of their claims. Andrews & Peterson made a successful season; the two taking out \$40 per day on an average. Bliss & Co., have two strata of paying gravel.

TRINITY COUNTY.

THE TRIAL SHAFT.—*Journal*, 17th: The shaft to prospect the bottom, is down twenty-five feet in granite containing boulders.

NORTH FORK.—The quartz prospecting has resulted in the discovery of a number of ledges. The ridge near Rich Gulch is said to contain a series of gold and silver veins. Some of the quartz will be brought to town for shipment below. The vein Mr.

Engel has been working has developed into a large ledge. B. C. Wattles last week discovered a ledge back of McGillivray's ten feet wide, containing native silver, and free gold.

INDIAN CREEK.—We visited the quartz ledge Wednesday. Silcox & Smith were down forty-one feet, the vein baving a width of between five and six feet. The quartz will pay to work. The question is, whether there is much of it.

Jessop & Ralph are doing well in Trinity at the foot of the island below the mouth of Grass Valley Creek. We are informed that their diggings pay half an ounce per day to the man.

Nevada.

COPE DISTRICT.

BALD MOUNTAIN.—*Elko Independent*, 17th: Dr. Bailey reports new and rich discoveries. He brought choice samples of copper-silver glance from the Blue Bell ledge. The Bailey mine shows well in sulphuret and chloride ore, and the Hartford in antimonial ores. Among the older locations attracting attention is the Mountain King.

ESMERALDA.

MONO.—*Cor. Inyo Independent*, 12th: The great Dunderberg mine at Castle Peak will soon astonish the country. The vein is said to be giving out vast quantities of rich decomposed ore, and there appears to be an inexhaustible supply in sight. Dagne's mill is being pushed to completion with energy.

AURORA.—Cor. of same: At Pine Grove the Wheeler Co.'s prospects are said to be good. Wilson has at last struck an abundant supply of water for his mill and has rich ore in sight. The Kean mine at Rockland has been opened for nearly a thousand feet, and every foot shows good ore. Kean's mill will soon commence crushing. The mines of Silver Peak hold their reputation for richness. Columbus is rapidly becoming a centre of attraction. Wetherill's camp in the White Mountains is very rich, the ore assaying \$300 to \$5,000 per ton. Four or five tons at Reno averaged \$500 per ton. The Wide West mill is in full blast. At Bodie, Walker, Lockburg & Co. cleaned up 130 tons rock in an ar at which paid \$33 per ton.

HUMBOLDT.

RAILROAD DISTRICT.—*Elko Independent*, 14th: Firestone from Pancake is coming for the Bullion City furnace. The Grant Co. burn coal. Col. Buel arrived from the East yesterday, and will take hold of the mines here in earnest.

ITEMS.—*Silver State*, 16th: The Original and South Arizona mines are taking out 70 tons per day. A large portion is shipped to San Francisco, and yields \$200 to \$400 to the ton. The mills are all running and the mines never looked better. We hear of activity in outside districts, especially Alpha, Oreana Central and Battle Mountain. The Harris mine, eight miles east of Oreana, was sold on Monday to Eneas Smith, agent of the old Rochester Mining Co. of Batavia, N. Y. We learn that some of the Hard Cash ore tested at Reno went over \$800 the ton.

REESE RIVER.

SILVER BEND ORE.—*Renaville*, 12th: At the Manhattan mill last week 6½ tons from the Arizona mine, Silver Bend, gave \$636 of silver to the ton.

BULLION.—Yesterday the Manhattan Co. shipped nine bars of bullion, weighing 865 pounds and valued at \$14,636.

LANDER HILL ORE.—Same of 17th: Five tons gave \$1,100 at Manhattan this week. We were told of another lot of about a ton which produced \$1,600. This last was chloride ore.

WHITE PINE.

REVIEW.—*News*, Sept. 18th: The mills are working steadily, and most of the leading mines are turning out ores of fair quality.

Gov. Matteson is pushing his smelting works toward completion. One furnace has been in blast for a week, and is working admirably. The result of the week's run is about 30 tons of bullion, assaying \$180 per ton in silver. For the last two days the work has been gradually increased toward full capacity. The result of the last twenty four hours' run was 170 bars of bullion, weighing about 8 tons—giving an average assay of \$186 per ton. The second furnace will be ready to receive ore by Wednesday, and a third the last of the week.

SOUTH AURORA never looked better. There are 80 men employed. 50 tons of ore are shipped daily. The last 3,000 tons had an average assay value of \$46 per ton.

WARD BEECHER is still looking well; 15 to 20 tons of ore are daily sent to the mill at Swansea. The pulp assays as high as \$50 per ton, giving an average of \$35.

O. H. TREASURE.—Is still a 'sealed book' to the outside world—all sort of rumors about rich strikes being heard on the street.

SILVER WAVE.—This continues to improve. Fifty tons ore from Shaft No. 4, was milled during the week, giving an assay value of \$72 per ton.

AURORA CONSOLIDATED.—Is closed for the present. The English Co., owning this and the Eberhardt mine have broken at Eberhardt City for the foundation 60-stamp mill.

BULLION SHIPMENTS FOR SIX MONTHS.—From Wells, Fargo & Co.'s office in this city: 789 bars, valued at \$1,006,755.26, of which \$519,495.47 went West, and \$487,259.80 went East. And this is exclusive of base bullion.

POCHE.—Cor. of same: Ely & Raymond's mill is turning out plenty of bullion. The new mill is pushed on as fast as possible. This machinery is on the ground. The grading and masonry are complete.

So far, the leading mines, the Ely & Raymond, Meadow Valley and Rutherford & Co.'s are all turning out good ore in large quantities.

A Hamilton telegram of 19th says: Eighteen bars of bullion, valued at \$19,142, arrived to-day from the Meadow Valley mine.

REVELLE DISTRICT.—The 10-stamp mill will be started in ten days upon ore from the Spy, Sweepstakes, Mediterranean, Atlantic, and other mines of the Co., of which there is on the dump—at least 250 tons of milling rock which will work near \$100 a ton. H. B. Hawkins, the managing agent, had just arrived.

EUREKA.—*Sentinel*, 17th: The new furnace of the Consolidated Co. will be running next week. The Bevan & Wallace furnace is lined with fire-proof stone, and will soon start. Col. Robbins' is closed for the present. The McCoy is nearly ready. The Geowey & Hurlburt is waiting for the collection of ore before commencing. The Jackson Co.'s new furnace will be running next week. The Co. now ships 20 tons per week worth \$340 per ton. McNevin & Dunne's reduction works are progressing. The Roslin is nearly ready. In 12 months this will be the richest and largest camp in the State. Virgin & Hines have sold the White Star mine for \$1,000. Mr. Music has struck it rich in a location south of the Patje & Corwin. Dimond & Co., west of the Empire, have a 10-foot ledge of \$120-ore. Last week the sum of \$45,000 in gold was paid for certain claims at Mineral Hill.

WASHOE.

SAVAGE.—*Gold Hill News*, Sept. 17th: The drift north at D street level, cut the good streak of ore in the Gould of Curry. Next week 30 to 50 tons per day will probably be extracted from this, milling from \$30 to \$50 per ton.

The yield from the eighth level nearly pays the expense of running the mine. August receipts, \$32,300.

IMPERIAL-EMPIRE.—The shaft is now 1,300 feet deep—the deepest perpendicular shaft in the State. The old upper Imperial mine continues to yield 40 tons of low grade ore daily.

VIRGINIA CONSOLIDATED.—A few tons of good ore daily from the old upper mine. Drift west from the 500-foot station of the new shaft energetically driven ahead.

OVERMAN.—Daily yield, 50 tons, average assays \$47. The body of ore recently developed at the 400-foot level has improved beyond expectation. Several tons of high grade ore have been taken from it, some of which yielded at Dall's mill, \$630 per ton.

GOULD & CURRY.—The body recently developed near the Savage line, is yielding several tons per day of rich sack ore, which is shipped to Reno. The daily yield of the mine is 100 tons.

YELLOW JACKET.—Daily yield 200 tons, from the section between the 800 and 900-foot levels, which shows an improvement.

HALE & NOBECROSS.—Daily yield 170 tons, principally from the seventh level. The 300-foot level yields 26 tons and a few tons come from the 175-foot.

BELCHER.—The raise from the 200-foot level shows good indications, and at the 152-foot level a body of fine grade ore, five feet wide, yields 12 or 15 tons daily.

SACRAMENTO & MEREDITH.—Some improvement in the upper workings. The new mill operates well.

CROWN POINT.—Incline down 50 feet below the 1,100-foot level; bottom still hard. Daily yield of the mine 40 tons of fair ore from the upper levels. August receipts, \$16,473.

CHOLLAR-POTOSI.—Daily yields 280 tons, in quality.

principally from the Belvidere section, which shows better and better.

SIEIRA NEVADA.—The mill runs steadily, with good results. Receipts for August reported at \$28,000.

ORISK.—The streak in the upper workings still yields a few tons of excellent ore daily.

HOPE.—Yielding 45 tons per day of ore that mills \$23 on the average.

COLE.—Considerable good milling ore, rich in gold, is being taken from the old upper tunnel.

REMOVAL.—The Rigby mill, at American Flat, has been removed to a point near the Six-mile House, where it is being set up. It will contain twenty stamps and will be used in crushing ore from three leads owned by General Williams and others. These leads are gold-bearing.

SHUT DOWN.—The Summit Mill has been shut down for want of rock to crush.

Arizona.

A Los Angeles telegram of 18th says:—News from Prescott to September 10th is received. Local excitement rages over rich discoveries in Bradshaw mountain, and astampede has taken place. Two prospectors brought in \$1,000.

Colorado.

BULLION FOR AUGUST.—*Central City Register*, 14th: Total coin value of gold, \$125,000; of silver, \$129,300.

GRAND ISLAND.—It is thought that the Cariboo mine will change owners before the time expires (18th) for which it was bonded to Cutler & Co., for \$125,000. The product during the past three months has been fifteen tons per week, which has been sold at \$25 per ton. The Idaho shaft is sunk scarcely 15 feet below the top of the crevice, nevertheless the value of the ore already raised exceeds \$5,000. The pay streak is three feet thick in the bottom. Should the present promise stand the test of development it will surpass any silver mine in Colorado.

SUMMIT COUNTY.—*Herald* 14th: Mann, Lovell & Co., Galena Gulch, have 800 feet of flume, work ten men, and take out 65 ounces of gold (\$1200) per week. The last week of August \$1620 was obtained. In Gold Run, Peahody is working 1200 feet, with 12 men, an average production of 50 ounces per week; Mumford is taking out \$300 with 7 men from a 600 foot claim. French Gulch probably exceeds all others at this time in its yield. Carter & Page, have struck the regular old "Humburg" streak. Georgia Gulch is mined by several companies. Young & Co. recently took out a nugget weighing over nine ounces. They are putting a flume into the "Swan," where they have a claim of 7,000 feet. John Sanlerson, Supt of the Boston Co., in Mayo Gulch, is working one of the best claims in the county, (2,100 feet). Two weeks ago he took out 30 ounces of gold from a round sluiced down, without shovelling. This company employ eight men, and take out an ounce to the man per diem. The water used is collected in a reservoir, and discharged in large bodies, and with great force, on to the hillside—a method that the miners term "bumming." Wm. McFadden in Illinois Gulch, using a flume, gets an ounce daily to the man. In Soda Gulch, Marksby & Clark are working five men and obtaining \$6 to the man. They are on a rich pay streak unknown until this season. They have 27,000 feet of ground. Jamez McFadden is working one of the most valuable claims in the county. A "clean up" takes place once in two or three weeks, when from 50 to 65 ounces of gold are obtained.

GRONGETOWN.—*Miner*, 15th: The Monticello tunnel has advanced 134 feet.... The Marshall has reached 835 feet.... The German Reduction Works are running on Wm. B. Astor ore.... The Helmick tunnel has reached 350 feet.... We are informed that good ore has been struck in the Grant Lode, Dailey District.... Lot of ore from the Senator lode, cut by the Morris tunnel, gave \$552 coin value, per ton.... An assay of a select sample from the J. O. Stewart, Cascade District, gave \$18,896.... Collom & Co have commenced treating ore at their Reduction Works at Swansea.... Coulter and Do Lamar, have made a new discovery on Republican Mountain.... The shaft on the Ogden lode is in solid ore, at a depth of 150 feet.

McAFEE Silver Tunnel Co.—We have evidence that samples, of ore from the Amador vein, belonging to this Co., have yielded by fire assay, \$32,000 per ton, in silver.

Idaho.

NEW MINES.—*Statesman*, 13th: A new excitement among the Snake River miners threatens to carry them all off. We learn that it is in the direction of the Montana

road. Parties out there sent word to a few friends to come slyly, but they were discovered and followed.

ALTURAS COUNTY.—Rocky Bar Cor. of same: I visited the Idaho mine on Saturday. Never in my life have I seen as rich ore in so large pieces. Many chunks would weigh one hundred pounds each, bespangled with gold. The ore now being taken out will pay \$200 to \$1,000 per ton, and they have enough of the same in sight to keep them at work for a year at least. They are crushing in arrastras. The Red Warrior is attracting attention again. The Richmond is yielding ore that will work from \$75 to \$200. Judge Kelly owns it.

Montana.

ALDER CREEK.—Virginia City Cor. of *Gazette*, 12th: Griffith & Thompson have struck good pay. Hammar, Myer & Co. took out Saturday \$531.60. Davis, Armistage & Co. are taking out \$200 to \$500 per day. Fenner took out 17 ounces in two days. John Donnegan has got down with his bed-rock flume. The Cork Co. on Bummer Dan's Bar, are taking out large. D. J. Emmez, an old pioneer, is drifting with success. Noteware & Co., have a gang of Chinamen at work. Their diggings are good. The ground above Virginia City is being worked over for the second and third times. Parker & Williams' flume pays clear of expenses from \$1,000 to \$2,000 per hundred feet—old ground. John Reid & Co. are making money fast. Renshaw & Co.'s Pine Grove Flume is proving remunerative. Southmayde & Co. are working ground which pays \$4,000 to \$50,000 per year. Next is Rossiter, Shank, Duncan & Co. Last week 68 ounces were obtained in one day, two men shovelling in.

TROUT CREEK.—The Co. which has been operating here for some years, failed last season to drain their claim, at 60 feet depth, with the machinery then on hand. They have just erected a Cornish pump 22 inches in diameter, which drained the claim dry in fifteen minutes. They now expect to reach bed rock soon.

THE PARK DITCH.—The water is now running through one mile of the ditch. It will be ready for work by the opening of the spring season.

ARGENTA.—Wash. Stapleton cleaned up, from eleven days' run with the Tootle Co.'s furnace, two hundred and twenty pounds of silver.

PIKE'S PRAIRIE.—*New North West*, 9th: The following clean-ups were made yesterday: Catching, Kohrs, & Co., \$4,059; Blair & Co., \$2,200; Roe, Beery & Co., \$4,001. This latter opened into pay last week. The other claims run from \$800 to \$1,000 each.

MOOSE CREEK.—Day & Harvey lead is developed to a depth of 200 feet and shows 6 feet crevice. The ore is very rich. Mr. Stapleton, who has been hauling it to Argenta—60 miles—and smelting it, says it yields \$500 per ton. He has been paying \$100 per ton at the mine.

Mr. Day has erected a 4-stamp battery, and Chilian mill, and operations will be commenced at once.

CEDAR.—Mr. Edinger reports bed-rock struck on "80 below," Saturday, and pays big. That settles the question about the deep ground, and demonstrates Cedar a permanent camp. The Copely Bros., Richard Quinn and Ed. Kinney own 79 and 80, and after running a 400 foot drain, sunk a shaft, which has paid \$45 to every four feet since they struck gravel. Bed-rock prospects \$1 to \$1 50. The strike occasioned a big excitement about Kiyus bar. All the companies are doubling their force. \$500 was offered for an interest purchased the week before for \$50.

ITEMS.—*Deer Lodge Independent*, Sept. 10th:—Eight companies are at work in Uncle Ben's Gulch, and all doing well.... Price & Co., of McEllan Gulch are doing well.... Good clean-ups in nearly every claim in Washington Gulch....

GERMAN GULCH.—Cor. of same:—Celestians have purchased Thomas Ford & Co.'s ground, known as the Irish Boys' claim, for ten thousand dollars in clean gold dust. The Dutch Fluming Co. are taking out \$1,000 per week. The Eureka Co., from \$500 to \$600. Earhart & Taylor work two men on bed-rock and take out from \$800 to \$900 per week. The Union Co. take out from \$1,200 to \$1,600 per week, with seven men on bed-rock. Dr. Beal's claim pays from \$1,000 to \$1,500 per week. He employs twelve men.

New Mexico.

BURRO.—San Diego telegram, 20th: Reports from the Burro mines, September 11th, say that Frampton and La Marebi, while prospecting were murdered by a party of Mexicans. The Herpending Co. have called a miner's meeting for the 17th

with the object of removing the present Recorder and changing the mining laws.

A Ralston letter to the *Press and Telegraph*, dated Aug. 31st, says there is very little going on except to do the work necessary to hold the ground.

Utah.

THE EMMA MINE.—The Salt Lake Correspondent of the *Corinne Reporter*, 17th, says: Day before yesterday the Emma shipped twenty car-loads—two hundred tons, and all this ore returns a clear profit of \$125 to the ton. Some \$40,000 have been cleared from the mine. But it has "pinched out" once to a crevice but an inch wide, though they have got below to a good vein again.

REDUCTION WORKS AT OMAHA.—Mr. J. A. Nye, writing to the *Omaha Herald* on this subject, remarks as follows: Though I have never been very much a friend of Omaha mining interests in the hurst district, still there are reasons why proper works would have advantages at Omaha, that they could not have at any point east of that. As far as the question of fuel is concerned, if we, for the time, consider the coal of Wyoming and Utah a suitable fuel, works of this kind should be at the western verge of such supply. But that is not so much the question as a market for the lead and bullion. From high authority I am able to state that the consumption of lead in the west alone, has risen to 15,000 tons per annum, while the production of lead in all the Western States has fallen to 11,000 tons per annum. The consumption of lead in the United States during 1869, amounted to 50,000 tons, of which 37,500 tons were imported. One white-lead manufacturer of St. Louis recently imported 800 tons of lead, at a cost of \$7.25 per hundred pounds. I think it easy to convince you that there is in Nevada, Utah, and Colorado, lead enough to do away with the necessity of importing a single ton, and generally, it carries enough of silver and gold to pay to mine it, if the lead has to be thrown away. The present shipments of base bullion from Nevada are so large that you would likely be surprised—and also from Utah, but the earth is scarcely scratched to supply the hundreds of imperfect furnaces that are built near the mines to treat it. I presume to say that competent men to run works to smelt ores are seldom met with on this coast, and yet there are thousands pretending to such knowledge. The transportation to the sea board will always be a clean saving and advantage for you, as the lead will find a market in the west. In fact, if you can sell lead, why can you not manufacture it as well as to send it away for some one else to work on, and then send it back to you in the form of paint, lead pipe, etc. There is to-day a great strife, though friendly, going on by capitalists in San Francisco to control the ore and bullion shipments from Utah and Nevada, and they do now get the greater share. You also have advantages in getting such coal as you may require.

STOCKTON SHIP CANAL.—According to the *San Joaquin Republican*, the preliminary survey of the canal, by Engineer Hall, has been completed and is favorable to the project. The distance is a little short of 11 miles, the whole fall is 8 3-10 feet, and the ground is generally of a favorably character.

THE CALIFORNIA PACIFIC RAILROAD has made a settlement with the land-owners, whose property was taken for right of way, in Sutter and Yolo counties. The aggregate amount paid in Sutter county was \$5,748, which was given in coin, although the company are said to be legally liable only for greenbacks.

AN IMPORTANT DECISION.—The appeal suit, at Portland, Oregon, before the Board of Trade against the Oregon Steam Navigation Co., decided that freight must be delivered at Lawiston at the expense of the Company, and that failures on account of low water does not release them.

PATENT SUIT.—Nevada papers report that the suit of the Messrs. Craig against A. Nevins & Co., for infringement of patent right in the use of Watson's nozzle, has been settled by compromise. The defendants confess judgment in favor of Messrs. Craig, for the patent right, with a perpetual injunction against infringement of the right, and pay \$450 damage.

New Incorporations.

The following have filed certificates with the County Clerk, San Francisco:

ANNOVO VALLEY DAIRY CO. Alameda County.—Sept. 8. Capital Stock, \$146,000 in 730 shares. Trustees: J. F. Black, W. H. Patterson and H. Ludea.

BAMBER'S EXPRESS CO.—Sept. 9. Capital Stock, \$100,000 in 1,000 shares. Trustees: John Bamber, Joseph L. Bamber, B. L. Taylor, H. P. Meader and R. P. Cleimcut. **DUCHE MILL AND M. CO.** No. 2. Lincoln County.—Sept. 15. Capital Stock, \$30,000 in 6,000 shares. Trustees: J. M. Martin, J. B. Matiu, R. Apple and P. McCannoh.

FALSADE SMELTING AND M. CO. Elko, Nevada.—Sept. 20. Capital Stock, \$460,000 in 1,400 shares. Trustees: T. J. Henley, E. F. Baldwin and S. A. Morrison.

The following have been recorded in the Secretary of State's office, Sacramento:

ORLEANS CONSOLIDATED M. CO. Nevada County.—Sept. 6. Capital Stock, \$210,000 in 2,100 shares. Trustees: T. W. Sigourney, A. B. Brady, O. Mallinan, T. Metu and C. P. Arington.

FOUR FORT M. CO. Sierra County.—Capital Stock, \$100,000. Trustees: O. Scheiffer, F. P. Heath and H. Elbery.

ARIEL G. M. CO. Sierra County.—Sept. 15. Capital Stock, \$20,000 in 1,000 shares. Trustees: O. C. Wilder and H. King.

COLUSA BANK. Colusa.—Sept. 16. Capital Stock, \$200,000 in 2,000 shares. Trustees: T. T. Good (President), O. Hogan, J. Boggs, E. Mills and H. Miller. W. F. Carrington, Cashier.

CALIFORNIA BEET SUGAR CO. Alameda County.—Capital stock, \$250,000 in 2,500 shares. Trustees: B. Flint, C. J. Hutchinson, A. D. Bonetate, E. R. Carpenter, E. H. Dyer, J. N. Rison and T. O. Phelps.

Meetings, Elections, Etc.

SUGGON M. AND M. CO., Sept. 16.—Trustees: P. J. White, J. M. Douglas, E. J. Moore, F. J. Shattuck and L. Teese.

ORIENTAL O. AND S. M. CO., Sept. 19, Trustees: J. W. Moyle (President), Charles Paes (Vice President), Chas. Melnick, T. Bagge, and M. Rudsdale (Secretary).

COSALA M. CO., Sept. 19.—Trustees: J. Mora Moss (President), C. Baum (Secretary), J. Wright, W. W. Areyand C. Melnick.

JENNIE A. CONSOLIDATED.—Trustees: E. M. Smith, I. Mulford (Treasurer), J. E. Purdy (President), T. R. Horton and T. S. Fitch, J. M. Bulington Secretary.

ARGENTA S. M. CO.—Trustees: John E. Dixon (President), George W. Stewart, T. J. Reilly (Superintendent) William Willis (Secretary), George W. Cope and J. W. Oashwiler.

Mining Shareholders' Directory—Meetings, Assessments and Dividends.

LEFT UNEXPECTEDLY.—We have been told on good authority that Mr. Kelly, who announced himself as editor of a proposed new agricultural paper, at Sacramento, has left without issuing the first number. We presume the field did not promise well enough for him to go farther with his operations—a fortunate thing, probably, for others than himself, i. e., cash in advance subscribers and persons who were expected to furnish funds in these dry times.

CONTINENTAL Life Insurance Co., 302 Montgomery street, corner of Pine.

Farming and Gardening.

COMMUNICATIONS for this department are solicited from all parts of the Pacific States and Territories.

Improved Sheep for California.

We would call especial attention to a notice in another column, from the *Omaha Herald*, of a flock of Cotswold Sheep, recently brought to this State, via the C. P. Railroad. These sheep were on exhibition at the late Sacramento Fair, where a portion of the flock was sold, and the remainder taken to Stockton for exhibition at the Fair now in progress there. We understand that some eight or ten of our best stock growers made purchases at Sacramento, and we presume the most or all of the balance of the flock will be taken up at Stockton and San Jose.

More Coming Next Spring.

We learn from Col. Saxe, personally, that he has 250 of these Kentucky Cotswolds (lambs of last spring) which he will bring to this State next spring, before shearing, and will hold shearing parties in different parts of the State, and show our wool growers the beauty and profit of this brand of sheep.

We understand that the Colonel and his family propose next year to come and take up their permanent residence here, where he proposes to become an extensive breeder and producer of sheep and wool. He will also start moderate sheep folds in Colorado, near Denver; in Nevada, vicinity of Reno, and in Utah, south of Salt Lake City, with the view of proving the various localities, as to climate, grasses, etc. Col. Saxe is entirely and devotedly in earnest in his work, and has the material in head, heart and pocket to warrant success in his efforts.

Ever since the first introduction of Cotswold sheep into this State they have been coming more and more in favor with our sheep growers, both as wool-bearers and for mutton. The first cost of obtaining this improved breed is the only extra expense, as they will thrive on our native grasses even better than our common stock. They are better and coarser feeders, more prolific, and come as early to maturity as any other breed. Being more hardy than our common sheep, they require less skill and care, and are better fitted to endure the hardships of scanty feed and water, and exposures to the pelting and continuous winter rains of California, without shelter.

The fleece of the graded Cotswold is worth one third more than that of the common short-wool breeds, and is much sought after for its silkiness and excellent combing qualities; while the carcass is from 33 to 50 per cent. heavier and makes a better mutton. Stock raisers on this coast are now very generally realizing the necessity of improving the breeds of all classes of stock, and in nothing more than sheep; and in closing we would not fail to urge upon our California farmers, the importance and advantage of keeping, at least, a few sheep on every farm. They will thrive on what would be otherwise absolutely wasted; and while they give but little trouble and next to no expense, they furnish a very acceptable supply to the table. Moreover, 50, 100 or 200 fleeces of wool annually, will do much towards paying the annual cash expenses of a farmer's household. It requires but little capital to begin with, and if you start right, your increase in a few years will be enormous in the generous and eminently prolific climate of California.

EARLY RAINS.—There are many indications that we are to have an early setting in of the rainy season, and it behoves farmers who have grain exposed to make early preparations to place it under cover. Large amounts are lost, every year, from neglect in this particular.

The California Pitcher Plant—*Darlingtonia Californica*.

Among the many new and interesting contributions to botanical science which have been furnished by the flora of California, we may mention the *Darlingtonia*, an accurate illustration of which has been prepared by our engraver, and herewith presented. It is more commonly known as the "California Pitcher Plant" or the "Fly-trap Plant." Our drawing has been reduced to a little less than one-half the natural size.

This plant inhabits low, marshy, wet places. It is a native of this State, and was first discovered at the foot of Mt. Shasta, by Mr. Brackenridge, assistant botanist of the Wilkes Exploring Expedition. Dr. Torrey first described and named it after the emi-

Torrey, via Panama, which were placed in the hands of several florists, none of whom succeeded in making them grow. Later in the season, however, its successful cultivation in England was announced. During the summer of 1869 Prof. Henry of the Smithsonian Institute and Dr. Torrey, not despairing in their efforts to succeed in the cultivation of this plant at the East, sent to the Agent of Wells, Fargo & Co. at Nevada for more specimens of the plant, which were immediately obtained at Moore's Flat, by Frank Henry, of Nevada, and forwarded to the Smithsonian Institute, via the Overland railroad. These plants arrived in fine condition, and it was one of them, if we mistake not, which showed the first bloom, on the Eastern side of the continent, much to the gratification of our New York florists, and which was

THE CALIFORNIA PITCHER PLANT.

nent, but now deceased American botanist, Dr. Darlington, of West Chester, Pa. It takes its popular name from its pitcher-shaped leaves, which are of a bright, mottled green color. The curious wattle-like appendages, which drop from its leaves are bright red, shaded with green. The flowers which appear in early spring are about two inches in diameter and of a pale purple color.

This plant flourishes and blooms freely in many parts of the State, and especially about Moore's Flat, in Nevada county. Dr. Torrey, who wrote the botanical reports of the Pacific Railroad Survey, says "it is one of the most remarkable of all vegetable productions and its acquisition would exceedingly gratify the botanists of this country and Europe."

Gen. Fremont furnished the Smithsonian Institute with some dried specimens of the plant many years ago, and some seven years since Prof. Brewer, then of the Cal. Geological Survey, sent an abundance of seeds to various parties at the East, only a few of which germinated; and the plants that did show themselves never attained any considerable size. Early in the spring of 1869, some living plants were sent to Dr.

duly noticed in the issue of the *SCIENTIFIC PRESS* of the 14th of June last. It was from this specimen that the *New York Agriculturist* obtained its drawing, which we herewith reproduce for the gratification of our California readers, together with the above brief history of the discovery and introduction of the plant into the Eastern States. The plant should be grown, in a close, damp atmosphere and kept in a moderate shade. It requires much water.

IMPROVED BREED OF SWINE.—Mr. Chas. E. Shillaber of Cornelia, Solano county, has recently received from Kanoville, Ill., a thorough bred Poland Spotted Chinese boar pig, three months old, and weighing 75 lbs. Quite too little attention has hitherto been paid in this State to the improvement of swine.

DISEASES IN ANIMALS, like diseases in the human body, are often rendered fatal by neglecting to notice the premonitory symptoms, and providing suitable and early remedies.

GRASSES as well as wheat may be cut too green, and may also be cut too ripe.

No man so well understands farming as he who has made poor land rich, and he will keep it rich. He is like one who has earned a thousand dollars.

"Cotswolds"—Thorough Bred!

The *Omaha Herald* of the 8th inst.—having interviewed the person in charge of the stock writes, as follows:—

"There arrived in this city, yesterday, the largest, finest lot of thorough-bred sheep ever seen in this western country. They are of the "Cotswold" breed, and consist of forty-four bucks and twenty-one ewes, the owner being Col. Peter Saxe, of Troy, New York. These sheep are now at the stock yards of the Union Central Railroad, and will be shipped for California at 6 o'clock this evening. They were bred by eleven different planters of Bourbon county, Ky., and were purchased by Col. Saxe of Hon. George M. Bedford, (and others) of Paris, Ky., an extensive breeder of horses, cattle, Cotswold sheep and Berkshire hogs, and who is conceded to be the greatest breeder of fine stock in the United States. A portion of these sheep were bred in England, one in Canada West, and the remainder in Kentucky. They all descended from sheep bred by English breeders, among whom are Lane, Langston, Gillet, Slater, and others. They are square shaped, and of great weight, having heavy fleeces of superior "combing" wool—an article now in great demand, both in England and America. The ewes are yearlings and two-year olds, and weigh from 190 to 270 lbs. each. The bucks are from one to two years old, weighing from 225 to 356 pounds each. They are all grass fed sheep, never having been grained at all. They shear from twelve to eighteen pounds to the head, the wool being 8 inches in length, at shearing time, of the finest texture.

This is the largest exportation of thorough-bred sheep over made from Kentucky, and includes the best and most valuable of the Cotswold stock in that State. Col. Saxe has written a guaranteed pedigree of each animal, giving all the weight, value, and the amount sheared from them. These documents are substantiated by the endorsement of the officers of the bank of Northern Kentucky, and there is no question regarding their accuracy and truthfulness.

The above is a condensed statement regarding the sheep now in this city, en route to the Pacific coast. Those who have visited the stock yards are enthusiastic over their beauty, and great astonishment is universally expressed by all who have seen them, the invariable opinion being that they are the most valuable animals that have ever crossed the Missouri river. They will be exhibited by Col. Saxe, at the coming California State Fair, and will, without doubt, command the highest premiums in the different grades for which they will compete. A sheep weighing nearly 400 pounds, and yielding as high as eighteen pounds of the best and finest wool, will certainly be looked upon as something remarkable in that State, and will be an invaluable acquisition to the stock of the Pacific coast. It is the intention of their owner to dispose of them to breeders there for the purpose of effecting a cross between the Cotswold breed and the Merino stock which prevails in that country. They will be shipped in two cars, which have been fitted up expressly for the purpose. Those of our citizens who desire to see the finest lot of sheep ever collected in this country, should avail themselves of the opportunity now offered. Col. Saxe will remain for a day or two in our city, previous to his departure for the land of gold.

GRAFTING THE TOMATO ON THE POTATO.—A correspondent of the *Horticulturist* states that he succeeded, perfectly in grafting a scion of the tomato upon the potato vine. He cut about one-third of the tomato shoot off, just below the leaf, taking care not to injure the buds at the base. The scion, being shielded from the sun, was every day sprinkled with a little water, and it took readily. In the fall the tomato was loaded with ripe and unripe fruit, and had grown to a large size.

A TEST OF VITALITY IN SEED.—While in conversation with a most excellent, lifelong, successful farmer, L. D. Votaw, he assured us that by plying almost any of the larger seeds on a hot pan or griddle where the vitality of the grain was perfect the grain would pop, or crack with more or less noise.

Where the vitality is defective or lost it lies immovable in the vessel. This is a very simple test and will be of much value if authenticated by extensive experiments. We have used the hot water and the acid tests for germination, but never the "trial by fire." Let us all try it.—*Colman's Rural World*.

A California Dairy Ranch.

Judge S. B. Noyce, one of the late agricultural party from the East, was invited while here, in company with Mr. X. A. Willard, the Dairy Editor of the *Rural New Yorker*, to visit the celebrated Dairy Ranch of Mr. Chas. W. Howard, in Marin county. We give below his interesting description of this extensive property:—

The ranch or farm of Mr. Howard which we are now to visit, is a tract of seventy thousand acres, having a line of fifty miles of Pacific Ocean coast.

Twenty-one dairy farms are already organized and stocked, averaging one hundred and fifty cows each. There is capacity for one thousand and five hundred more cows. The buildings on the several farms cost on the average of \$4,000. Look on Bancroft's map of California and find it bounded on the west by Drake's Bay, Point Reyes and the Pacific Ocean, on the east by Tomales Bay.

After lunch we go on again, and coming to the dairy farm we go through it. Mr. X. A. Willard, here makes careful inquiry. Here were one hundred and sixty-five cows. They are milked twice daily and are turned out at night as by day to feed. The milk is poured all into one can, and then set in pans on racks in a room of even temperature. The cream of each milking is put together in a large square wooden churn which is turned by horse power, the skimmed milk and the buttermilk are fed to hogs. The butter is worked by Capt. O. Allen's butter worker, and is moulded into two pound lumps, each covered by white cotton cloth, stamped and packed in boxes and sent fresh to San Francisco by small schooners. The work is done by men entirely. The milk is set from thirty-six hours to forty-eight hours, skimmed before it sours; the cream is allowed to become a little acid before churning. About one ounce of salt to a pound of butter is used.—Liverpool salt, which costs from \$30 to \$55 per ton.

The Home Ranch Dairy.

About 3 o'clock P. M., we arrived at the Home Ranch of our princely host, distant ten miles from Olema west. This comprises three thousand acres; four hundred and thirteen cows; one hundred and fifty horses for work, saddle, lasso horses, and a thorough bred English stallion. On this farm were pasturing, two hundred head of beef cattle and four hundred heifers to make cows. The cattle are sold at three years and upwards to San Francisco—bring from \$40 to \$60 per head.

The two year old heifers yield an average of three-fourths of a pound of butter per diem; old cows from one pound to one pound and one-fourth per day for the season, which brings thirty cents (gold) in the market. From twelve to sixteen men are employed here for six months in the year at \$30 and board per month. The only fodder cut is green oats, about one hundred tons yearly on about fifty acres. We were shown a herd of heifers, one hundred and fifty-two head—which have one thousand and two hundred acres to feed on—fifty of these were three years old; one hundred and two, two years old; one hundred and twenty-three "came in" last spring, which made a pound of butter daily this season; at four and five years they will make one fourth pound per day, and two hundred pounds per annum each.

Some of the butter is packed in barrels in brine. Each farm churns daily about fifty-six pounds. The pastures are covered with the "Bunch" grass which grows all the season when there is moisture enough and is fair feed when dry.

We dined at the Home Farm, and the dinner, provided by the two Chinamen, who had the whole care of the home under the direction of Mr. R. W. Nichols, superintendent, was a grateful repast.

I slept soundly, and was awakened just before sunrise by the song of the martins, whose box was close under the eaves near my window.

At six o'clock, A. M., on the morning of August 2d inst., we had breakfasted, and with a fresh team, two mules on the pole, and two bold yet steady going horses on the lead, we left the home farm for a further examination. There were upwards of one hundred and fifty miles of fence on the tract, all made from wood picked up by wreckers on the Pacific coast. The lumber booms from Oregon break up and the timber drifts on the coast. It is split into slabs or staves four or five inches in width, which are driven into the ground about one inch apart, making a fence, pig tight, about six feet high and fastened along the top by slabs. This fence never rots, and

is not started by the post, for there is none; its costs about \$400 a mile.

Mr. Howard started these dairy farms, of which we visited seven, with common American stock. He then imported two five Short-horns from Vermont at an expense of \$1500. The same year imported a herd of sixteen Devons. This was a failure. They were not of the right class. They didn't shew well over the pail, and he discarded them. He is now breeding Shorthorns—half breed and thoroughbred Shorthorns. He now uses nothing but thoroughbred Shorthorns which deteriorate in size—which Mr. Howard said substantiated the theory of Dr. Loring on this point.

Mr. Howard lets the cows to the tenants of the farms at from \$25 to \$30 a cow per annum, and furnishes all the buildings; allows about ten acres to a cow. Tenants furnish everything except land, buildings and cows. One-fifth of the stock they raise for him. The hogs they sell for from six cents to eight cents per pound on foot.

The oats are cut just before they are ripe and fed to the stock, commencing about the middle of July and fed till the rains commence about Nov. 1st. He ploughs for oats in November and puts in the seed in December, sowing about one hundred and fifty pounds to the acre. Stock are fed only when it is very hot or windy. In mild days when the stock can get about, do not feed. Some seasons cows do not require feed at all. Thermometer in winter averages about sixty degrees Fahrenheit. Stock runs out all winter. Cows come in, in December and till March; want them all in by April.

What I Know of Farming—No. 36.

Stones on a Farm.

This earth, geologists say, was once an immense expanse of heated vapor, which gradually cooling at its surface, as it whirled through space, contracted and formed a crust, which we know as rock or stone. This crust has since been broken through, and tilted up into ranges of mountains and hills, by the action of internal fires, by the transmutation of solid bodies into more expansive gases, and the fragments torn away from the sharper edges of upheaved masses of granite, quartz, or sandstone, having been frozen into icebergs floating, or soon to be so, have been carried all over the surface of our planet, and dropped upon the greater part, as those icebergs were ultimately resolved, by a milder temperature, into flowing water. When the seas were afterward reduced nearly or quite to their present limits, and the icebergs restricted to the frigid zones and their vicinity, streams had to make their way down the sides of the mountains and hills to the subjacent valleys and plains, sweeping along not merely sand and gravel, but boulders also, of every size and form, and sometimes great rocks as well, by the force of their impetuous currents. And, as a very large, if not the larger, portion of our earth's surface, bears testimony to the existence and powerful action through ages, of larger and smaller water-courses, a wide and general diffusion of stones, not in places, but more or less triturated, smoothed and rounded by the action of water, was among the inevitable results.

These Stones are sometimes a Facility,

But often an impediment, to efficiency in agriculture. When heated by fervid sunshine throughout the day, they retain a portion of that heat through a part of the succeeding night, thereby raising the temperature of the soil, and increasing the deposit of dew on the plants there growing. When generally broken so finely as to offer no impediment to cultivation, they not merely absorb heat by day, to be given off by night, but by rendering the soil open and porous, secure a much more extensive diffusion of air through it than would otherwise be possible. Thus do slaty soils achieve and maintain a warmth unique in their respective latitudes, so as to ripen grapes further North, and at higher elevations than would otherwise be possible.

The great prairies of the West, with a considerable portion of the valleys and plains of the Atlantic slope, expose no rock at their surfaces, and little beneath them, until the soil has been traversed, and the vicinity of the underlying rock, in place, fairly attained. To farmers inured to the perpetual stone-picking of New England, and other hilly regions, this is a most welcome change; but when the pioneer comes to look about him for stone to wall his cellar and his well, to underpin his barn, and form the foundations of his dwelling, he realizes that the boulders he had exulted in leaving behind him were not wholly and absolutely a nuisance; glad as he was to be

rid of them forever, he would like now to call some of them back again.

Yet, the Eastern farmer to-day has fewer uses for stone than his grandfather had. He does not want his farm cut up into two or three-acre patches, by broad-based, unsightly walls, which frost is apt to heave into greater deformity and less efficiency; nor does he care longer to use them in draining, since he must excavate and replace thrice as much earth in making a stone as in making a tile drain; while the former affords shelter and impunity to rats, mice, and other mischievous, predatory animals, whose burrowing therein tends constantly to stimulate its natural tendency to become choked with sand and earth. Of the stone drains constructed through parts of my farm by foremen whose wills proved stronger than my own, but two remain in partial operation, and I shall rejoice when these shall have filled themselves up and been counted out evermore. Happily they were sunk so low that the subsoil plow will never disturb them.

Stony Ground for Timber Growing.

Still, my confidence that nothing was made in vain is scarcely shaken by the prevalence and abundance of stone on some of our Eastern farms. We may not have present use for them all; but our grandsons will be wiser than we, and have uses for them which we hardly suspect. I insist that land which is very stony was mainly created with an eye to timber-growing, and that millions of acres of such growth forthwith to be planted with Hickory, White Oak, Locust, Chestnut, White Pine, and other valuable forest-trees. Every acre of thoroughly dry land, lying near a railroad, in the Eastern or Middle States, may be made to pay a good interest on from \$50 up to \$100, provided there be soil enough above its rocks to afford a decent foothold for trees; and how little will answer for this purpose none can imagine who have not seen the experiment tried. Sow thickly, that you may begin to cut out poles six to ten feet long within three or four years, and keep cutting out (but never cutting off) thenceforward, until time shall be no more, and your rocky crests, steep hillsides and ravines, will take rank with the most productive portions of your farm.

In the edges of these woods, you may deposit the surplus stones of the adjacent cultivated fields, in full assurance that moth and rust will not corrupt nor thieves break through and steal, but that you and your sons and grandsons will find them there whenever they shall be needed, as well as those you found there when you came into possession of the farm.

Uses for Stone.

I am further confident that we shall build more and more with rough, unshapen stone, as we grow older and wiser. In our harsh, capricious climate, walls of stone-concrete affords the cheapest and best protection alike against heat and frost, for our animals certainly, and, I think, also for ourselves. Let the farmer begin his barn by making of stone, laid in thin mortar, a substantial basement story, let into a hillside, for his manure and his root-cellar; let him build upon this a second story of like materials for the stalls of his cattle; and now he may add a third story and roof of wood for his hay and grain, if he sees fit. His son or grandson will, probably, take this off, and replace it with concrete walls and a slate roof; or this may be postponed till the original wooden structure has rotted off; but I feel sure that ultimately, the dwellings as well as the barns of thrifty farmers, in stony districts, will mainly be built of rough stone, thrown into a box and firmly cemented by a mortar composed of much sand and little lime, and that thus at least ten thousand tons of stone to each farm will be disposed of. It may be somewhat later still before our barnyards, fowl enclosures, gardens, pig-pens, &c., will be shut in by cemented walls; but the other sort affords such ample and perpetual lurking-places for rats, minks, weasels, and all manner of destructive vermin, that they are certain to go out of fashion before the close of the next century.

As to hasting on stone, too large or too firmly fixed to be otherwise handled, I would solve the problem by asking, "Do you mean to keep this lot in cultivation?" If you do, clear it of stone from the surface upward, and for at least two feet downward, though they be as large as haycocks, and as fixed as the everlasting hills. Clear your field of every stone bigger than a goose-egg, that the plow or the mower may strike in doing its work, or give it up to timber, plant it thoroughly, and leave its stones unmolested until you or your descendants shall have a paying use for them.

How to get rid of Large Boulders.

A friend deeply engaged in lumbering

gives me a hint which I think some owners of stony farms will find useful. He is obliged to run his logs down shallow, stony creeks, from the bottom of which large rocks often protrude, arresting the downward progress of his lumber. When the beds of these creeks are nearly dry in Summer, he goes in, with two or three stout, strong assistants, armed with crowbars and levers, and rolls the stone to this side and that, so as to leave a clear passage for his logs. Occasionally, he is confronted by a big fellow, which dodges his utmost force; when, instead of drilling and blasting, he gathers dead tree-tops, and other dry wood of no value, from the banks, and builds a hot fire on the top of each giant boulder. When the fire has burned out, and the rock has cooled, he finds it softened, and, as it were, rotten, on the top, often split, and every way so demoralized that he can deal with it as though it were chalk or cheese. He estimates his saving by this process, as compared with drilling and blasting, as much more than fifty per cent. I trust farmers with whom wood is abundant, and big stones superabundant, will give this simple experiment a trial.—*Horace Greeley.*

VALUABLE REPORTS.—Both President Wilder and the party of pomologists which accompanied him, and the large Agricultural party which followed soon after, are making wide and extensive mention of what they saw and learned, while here, of the pomological and agricultural resources of California. These reports emanating from so high a source, will be received with the utmost confidence by parties at the East and elsewhere abroad. We shall take an early opportunity to make free extracts from these reports—one interesting item from which will be found in our issue to-day from the Massachusetts *Ploverman*.

DEEP CULTURE.—Mr. Dalton, of England, claims that he has, by careful examination, shown that where there is mellow soil for three feet below any crop, it can defy the severest drought, and come to maturity, without a drop of rain, after it has got a fair start. This shows that tillage may be made successful on our most arid plains, where there is fertile soil, by deep culture alone.

A GOOD IDEA.—The *Antioch Ledger* says the farmers in that section are busily engaged in plowing their land for the coming year. The object is to loosen the surface of the ground so that it will retain all the rain that may fall. This, in a measure, answers summer fallowing. Earnest and thorough work, only, is needed to secure good crops in this State in our driest seasons.

A NUMBER of valuable cows are said to have recently been poisoned in Fresno county by eating the buckeye plant.

Our Printed Mail List.

Subscribers will notice that their names are printed on colored paper and pasted upon each copy of the PRESS. This is done by machinery, to expedite the issue of our paper, the regular edition of which has become too large to be convenient to send out by the old method of writing the names. The figures found on the right of the pasted slips represent the date to which the subscriber has paid. For instance, 21st 70 shows that our patron has paid his subscription up to the 21st of September, 1870; 4jy71, to the 4th of January, 1871; 4j10, to the 4th of July, 1870. The inverted letters occasionally used are marks of reference, simply for the convenience of the publishers.

In setting up the list the compositor made some few errors which have been rectified by a careful revision and comparison with the mail book. If errors in the accounts of subscribers occur at any time an early notice will secure their immediate correction.

We believe this to be the first introduction of this system of mailing in California, and we consider it a valuable improvement.

The San Joaquin Agricultural Fair.

The pavilion in which the articles on exhibition are placed is a commodious wooden structure, newly erected for the purpose, in a central part of the town. The decorations are very scanty, but quite cheerful, and the display of pictures, drawings, paintings, ornamental pieces of various kinds, and fabricated goods, etc., are so arranged as to aid very materially in the effect of finish.

A beautiful pyramid of green house plants in the center of a round table, laid out with cut flowers elegantly arranged, is quite a feature in the center of the pavilion. Above and upon the posts around are evergreen trimmings and festoons which add much to the effect. The display of fruit is better than anything shown at San Francisco, Marysville, or Sacramento. The showing is not so large; but it is exceedingly fine. The size and beauty of the apples, pears, and grapes are superior to anything shown elsewhere. A more detailed description must be deferred till our next; as space will not allow more mention this week.

SAN DIEGO.—The postal authorities have changed the post office designations of New and Old San Diego. The former is to be called hereafter San Diego; the latter, North San Diego.

Notes on the State Fair.

In our mention here of articles on exhibition, we shall only note such articles as we were able to examine and obtain information upon, during our brief visit.

One of the best signs observed at the fair, is the introduction of some entirely new industrial products of this State—for instance, we observed some nicely polished wagon hubs, 12 inches in diameter, made of black locust by E. Soule, of Sacramento. The wood we understand, is very sound, tough and desirable, and was grown in Sacramento, since the year 1854. It shows we can raise superior hardwood timber, and very rapidly too.

Among the plows exhibited, our special attention was called to a gang, exhibited by Matteson & Williamson, of Stockton, invented by Mr. Murray, constructed mostly of iron. It is not in the least complicated, but appears complete, both in principle and construction.

E. W. Walton's patent horse hoe, is a novel looking instrument for cutting weeds just below the surface. It is a labor saving thing, likely to come into general use when its advantages for the cultivation of our peculiar soil are better understood. He also exhibits a new, cheap and neat operating gang plow, a goodly number of which have been manufactured for sale by Knapp & Grant, of San Francisco.

Stockton's patent rock drilling machine makes good progress in hard stone. The drill is raised by a cam and tappet against an adjustable spring, which sends the drill down with the regulated force desired. It is revolved by a screw, and the whole device is strong and complete. It is worthy of a test in our stone quarries, and a more thorough trial than it has yet had in the mines.

MESSRS. TREADWELL & Co., of San Francisco, exhibit, besides their general display of agricultural implements, one of Hoadley's farm engines styled the "Cinderella." Its lightness and completeness are claimed to specially recommend it for farm use.

W. H. Keep exhibited three sizes of his patent suction and force pump, invented and manufactured at the Globe foundry in Stockton. They worked well and easily. The air chamber on one size has an instantly adjustable vent, or air escape, by which the pump is made to throw a steady stream and obviate the objection raised to the ordinary force pump when employed for house use.

M. & A. Wilcox, of Sacramento, whose direct acting water lifters have been illustrated in the PRESS, display a moveable lifter, showing the manner in which the apparatus may be suspended by chain and pulley in a mine, or shaft, and the water taken up through a flexible tube or hose.

John A. Ball, of Grass Valley, has a new water elevating apparatus for common wells. Roughly constructed, yet it operated favorably. He employs two endless chains passing over two chain wheels set a foot or so apart on the same shaft. Between the chains are hung two buckets, so arranged that while one descends on one side of the shaft, the other bucket arises on the opposite side. A self-operating valve placed in the bottom of the bucket allows the water to escape through a spout beneath the bucket, by which it is directed into a pail or other receptacle at the side of the well. The valve is operated in a simple manner just previous to the turning of the bucket over the chain wheels. Mr. Ball's elevator for ditching and embanking purposes, erected on the fair grounds, was too rude an affair to demonstrate the efficiency of his patented device for which he claims extraordinary merits.

Of Marvin's harvester, operated on the fair ground, we expect to speak hereafter. Ten machines have already been constructed, by Mateson & Williamson, of Stockton.

D. L. Perkins, of Sherman Island, shows a variety of choice seeds. The demand for California raised seeds in the East is increasing, and when the advantages of purchasing our seeds in the East is better and more generally known, the demand will increase immensely. Mr. P. has sold some tons of sugar beet seed to the Alvarado beet sugar company, at 60c per lb. If he had preserved a larger amount, he could sell it equally well. To dispel the erroneous idea that excellent grapes could not be raised on the reclaimed tule lands of Sbermen Island, Mr. Perkins brought a fine display of that fruit, showing a fine growth, and sweet and pleasant flavor.

Wilkie Darling, of San Francisco, who makes the sale of steam lubricators, self oilers, and other like apparatus a specialty, displayed a good variety of improved machinery in his line. Further items next week.

"CAN'T AFFORD IT" is the reason given by many subscribers for stopping their paper. Before acting on such an assumption let any subscriber of the PRESS ask himself, with a little reflection if he has not already, during the year, gathered information from our columns whereby he has or might have saved or gained more than the cost of subscription. It is our aim to place before our readers valuable and profitable information. We aim to make the PRESS a journal which intelligent, thinking readers cannot afford to dispense with. We know the times are hard and money is scarce, and the few who do discontinue their subscriptions to this paper do it with much reluctance, and often with many apologies and encouraging remarks; we would ask such if they cannot find other and less useful points of curtailment in the necessary reduction of expenses. A word to the wise, etc.

MECHANICAL TYPE SETTER.—We have received from Orren L. Brown, 30 and 40 Hanover street, Boston, a description of his Type Setter and Distributer. According to the description, the Setter has set, with inexperienced hands, as much as twelve hundred ems of solid brevier, or the like amount of long primer, in an hour. This Setter was perfected some five years ago, but the necessity of a Distributer proved a bar to its extended usefulness. Mr. Brown has now invented a Distributer, which, he avers, is successful and satisfactory both in its principle and operation, and renders his device complete. As one half of the cost of books and periodicals consists in the labor of setting type, Mr. Brown's machine, if equal to the requirements of simplicity and rapidity, ought to meet with most extended use; and the price (\$300 for the Setter with case for 60 letters, and \$700 for the Distributer with 30 receiving channels) cannot be called any too high.

MONITOR REDIVIVUS.—We understand that the Monitor, known also as the "Haunted" mine, El Dorado county, stands an excellent chance of waking up to activity after its various vicissitudes of fortune. Mr. Furman R. Wilson, he of the steam stamp mill, has been experimenting on the ore, and thinks of taking it in hand. That he may be successful is the wish of the PRESS and of all interested in the mining developments of our country. The old mine doesn't appear to be played out yet.

POLYTECHNIC LECTURES.—Prof. Ezra S. Carr, Professor of Agriculture of the State University, will deliver a Lecture at the Mechanics' Institute Hall, 27 Post street, in this city, on this (Saturday) evening, at 7½ o'clock. Subject—"Industrial Education." The professor is one of the best lecturers on popular subjects on this coast, and this one cannot fail to be of general interest. We understand that the series of lectures by Prof. Carr will be continued, though experiments in the least dangerous will be omitted in the future.

Mechanics' Institute—Quarterly Meeting.

The regular quarterly meeting of the Mechanics' Institute was held on Saturday evening of last week.

President Hallidie presented his quarterly report, embracing the reports of officers and committees. During the past year \$5,000 has been expended for new books, \$2,000 for repairs to the building, and \$10,000 on the mortgage. The amount now due on the mortgage is \$40,000. The rate of interest had been decreased, saving thereby \$66 60 per month. The number of members is constantly increasing. The plan of organizing clubs of members for special purposes was referred to approvingly. In that way clubs for the study of engineering, ship-building, discussion or music might be rendered effective, and at the same time strengthen the Institute.

The Library committee reported 601 books added by purchase and 14 by donation. Since the 1st of June, 84 members had joined the Institute.

The Treasurer reported the receipts of the past quarter to be \$3,517 14; disbursements, \$3,288 99.

The Horticultural Exhibition yielded \$7,382 80; disbursements, \$6,000.

The consent of the Supervisors had been obtained to the retention of the Pavilion on Union Square, until November 1st, 1871. The next Fair would have to be held earlier than usual in the season, in order to insure the removal by that date. In the opinion of the President of the Institute, a lot should be purchased at some favorable locality, and, as soon as practicable after the next Fair, a new building erected at a cost of \$150,000. Legal measures not yet decided, had been taken to compel the removal of the present Pavilion at once. Counsel had been engaged to defend the interests of the Institute.

At the conclusion of the report of the President, the Institute adopted a resolution to hold a Fair in 1871, and giving the Board of Managers the authority to arrange all details.

The chair announced that Charles A. Hoff had been selected by the Board to fill the vacancy caused by the resignation of Mr. Hammond.

Mr. Ward inquired if ladies were entitled to the privileges of the reading-room the same as men, and the chair answered in the affirmative. Adjourned.

A NEW PAPER. The junior editor of the PRESS, who knew not previously that his fame had reached so far, acknowledges the receipt of the Petaluma Daily Crescent. After a careful perusal of that paper, he feels disposed to say that the Crescent "will do," and that, if it continue as ably edited as are these numbers, and as wide awake to the varied interests of Petaluma, it must succeed. We see that it is alive to the benefits conferred by a railroad.

INDIAN WAR IN ARIZONA.—Letters from Tucson give items of nine persons, besides an unknown number of Mexicans, killed, and trains and stages destroyed by the Indians in Arizona during August. Tucson is in a state of siege except for strong parties. Gov. Safford has called for volunteers and the citizens are to take active measures to compel the cessation of these warlike acts. May they succeed.

MONTANA TERRITORY.—The population of Montana, according to the census returns is, 20,580. The Indians are estimated at 18,000. The Chinese constitute one-tenth of the population. Helena has 3,713 inhabitants.

At the coming fair of the Colorado Territorial Agricultural Society, four Gold Medals, eighteen Silver Medals and twenty-four Diplomas are offered for exhibits of ores of various kinds.

Our Home Industries.

Manufacturing and Preserving Building Stone.

Many of our readers have doubtless noticed, in walking about the city, that the stone of many buildings is gradually decaying or becoming discolored, which is the first step towards decay. This is a matter which has attracted attention in large cities from time immemorial and is of the greatest importance wherever there is any chance for architectural ornamentation. Numerous inventions have been made from time to time of processes for the preservation of building material, and we have a list of patents of such, which are of the most varied description. The use of soluble silicates has been tried in various ways, and has long promised well. But the only really, practically successful process of which we know, is that of Mr. Frederick Ransome, formerly of Ipswich, England, but now of London, who for twenty-six years has been at work manufacturing stone and has, in this time, improved and perfected his method until he has achieved a grand success.

The Pacific Stone Manufacturing Co.

Some two years ago, a company was organized in this city and bought Mr. Ransome's patents (for they are many in number) for California. They erected works on the corner of Turk and Larkin streets, and tried to manufacture stone according to this method. Although they received quite a number of orders, yet they were not wholly satisfied with their efforts and never allowed a stone to go from their works. Finally the Secretary, Dr. Wm. B. May, went to England, and succeeded in inducing Mr. Ernest Leslie Ransome, who has been interested for years in the manufacture and has himself made a number of improvements, to come to California for a year, in order to superintend the manufacture. We had the pleasure of a call from Mr. Ransome a short time since, and made a return call at the factory this week.

The Ransome process, our readers will remember from articles which have previously appeared in the Press, consists briefly in firmly cementing particles of sand by an insoluble silicate of lime, this insoluble silicate being formed by the action on one another of two soluble bodies,—silicate of soda and chloride of calcium,—which form silicate of lime (insoluble) and chloride of sodium (soluble). We now propose to show at length

How the Process is here Conducted.

The first thing is to make the soluble silicate of soda. Pieces of quartz are placed in an iron boiler, into which is introduced a solution of caustic soda. This is heated by steam pipes passing through the boiler, and when the soda has dissolved sufficient quartz, the formed silicate of soda is blown out into a reservoir and a fresh charge of caustic soda introduced; and this is continued until all the quartz is dissolved. The solution of soda silicate is allowed to settle in the reservoir, until free from any sediment, and is then carried over to another tank, where it is evaporated until it has a specific gravity of about 1.70 and has acquired a consistency as of treacle.

The next step necessary is to mix this substance with the proper materials for making a good building stone. As the hardest and most durable stone is that which contains the most silica, sand is taken for a basis, and for mechanical purposes, to fill up the interstices between the sand particles, a fine, powdery article is required. Finely pulverized sand, chalk and various other substances will answer the purpose. Here in California we have an excellent material provided by nature, the infusorial earth, an aggregation of minute particles of silica. That used in this instance comes from Calaveras county. The sand, which has been dried in a revolving cylinder over a fire, infusorial earth and silicate of soda are now thoroughly mixed in a pug-mill (something like a Chili mill), and then put in moulds of any form desired, and compacted by encreuf hand or machine pressure.

The third step consists in treating the blocks with a saturated solution of chloride of calcium. They are placed on a frame which is sunk in a tank of the solution until the blocks thereon are immersed in the liquid. Then a pipe (connecting with an exhaust pump) is inserted in a hole in the block (when this is allowable), or a funnel shaped nozzle fitted with a perforated plate, or some similar device, is placed

close against the block, and by exhausting the air, the liquid is forced to enter and pass through the pores of the stone. This completely saturates it with chloride of calcium, and the reactions above described take place. The blocks are now boiled in a solution of chloride of calcium, as this causes the stone to be much more durable and much harder, giving, it is affirmed, a more crystalline structure.

Finally the stone is placed under a sprinkler and water is showered upon it, or, by appropriate apparatus, water is forced or sucked through it, thus removing all soluble matter and leaving a rock composed almost entirely of silica and silicate of lime.

In making grindstones, the process is similar but the apparatus is different. Flint or other extremely hard matter may be taken for a basis, and the saturation takes place in peculiar moulds, which have a small reservoir for the chloride of calcium solution above and a false, perforated bottom, and exhaust pipe below. There are several other points not necessary to mention here.

Strength and Durability of the Stone.

In point of strength the stone thus formed is surpassed but by few, if any, natural rocks. Prof. Ansted, in tests made, found that a bar of this stone, 4x4 inches, resting on supports 16 in. apart, sustained a weight of 2,122 lbs. suspended in the centre, while a like bar of Portland stone (one of the best natural stones of England) broke at 759½ lbs. A four-inch cube of

HILLER AND ELLIOT'S IMPROVED CARRIAGE CONSTRUCTION.

this stone was found to sustain a weight of 30 tons before being crushed. Of the great strength of the stone there can be no question.

As regards its durability the same can also be said. Dr. E. Frankland made a series of experiments with reference to this point. We have not space to give the details thereof. But Dr. F. says, in giving the results, "I am induced to believe that Mr. Ransome has invented a material which, with the exception of the primary rocks, is better capable of giving permanency to external architectural decorations than any other stone hitherto used. There is nothing in the composition of the stone which would lead me to anticipate that it would suffer from exposure in the saline influences of the atmosphere upon the sea coast; on the contrary I should think it peculiarly fitted to withstand such influences."

Tested by exposure to the extreme atmospheric influences in Russia, the stone has given extremely good results. In India, where the building stone used has given especial trouble by its speedy decay, the British Government has bought the patent right and erected two establishments—at Bombay and Madras—so well convinced are they of the merits of the process. And long experience in England has given continued proofs in its favor. Manufactories for the production of this stone exist also in Australia, Belgium, Denmark and Sweden.

Preserving Stone—Ornamental Work.

On these points we could speak at length, had we space. Suffice it to say that the patents cover methods of coating stone or other material, or impregnating wood, etc., so as to preserve them from decay. Buildings much decayed have thus been restored with ease. Patents cover also the manufacture of colored ornaments, etc., etc.

The Pacific Stone Company is now fairly at work. They will take orders for stone for building or other purposes, for preserving natural stone from decay, and for rendering stone or brick walls impervious to

dampness. Their scale of prices is not wholly fixed as yet. But it is certain that they can furnish highly ornamental work, as mural decorations, fountains, monuments, etc., etc., at exceedingly low prices, and of many varied designs. The officers of the company are Alvinza Hayward, President; Dr. Wm. B. May, Secretary; Maj. O. C. Miller, Treasurer. The other principal stockholders are Gen. J. F. Miller, J. D. Farwell and W. H. Farwell. The office is at this factory, corner Turk and Larkin streets.

Improved Carriage Spring.

We have often spoken of the importance of improvements in the construction of vehicles, with respect both to the comfort of the person carried and to the ease of the draught animal. We have now another illustration of the kind, which is well worth the notice of those who are accustomed to ride considerably in carriages.

This consists in a certain arrangement of the springs and their connections, whereby all the motion imparted in traveling is given directly from the center of the body and combining suitably enclosed rubber springs with wooden ones, so that the carriage rides very easily and noiselessly. A glance at the drawing will show how this is effected.

which hold blocks of rubber which rest on the bolts. This is more especially necessary in the spring, B, as when the carriage body rocks forward and backward it causes considerable end motion, which the elasticity of the spring, G, would not be sufficient for.

The inventor having made strong claims for the excellence of his device, a representative of the Press was sent to test it. After a satisfactory experiment, he reports that for ease and comfort, he knows of no superior, if of an equal.

A patent for this improvement was granted Aug. 11th, 1870, through the Scientific Press Patent Agency, to John R. Hiller and Clark Elliott of Woodland, Yolo county, Cal., who may be addressed for any further information.

A Full List of Patents Issued to Pacific Coast Inventors.

(FROM OFFICIAL REPORTS TO DEWEY & CO., U. S. AND FOREIGN PATENT AGENTS, AND PUBLISHERS OF THE SCIENTIFIC PRESS.)

FOR THE WEEK ENDING SEPTEMBER 13TH.

GALLEY-REST.—Henry H. Gale, Eugene City, Oregon.

PERMUTATION LOCK.—Martial Heineque, San Francisco, Cal., assignor to himself and Alexander Stieger, same place.

SIDING FOR BUILDINGS.—Clerk Avery, San Francisco, Cal.

DEVICE FOR SECURING COVERS UPON SEWING-MACHINES.—John H. Mooney, San Francisco, Cal.

MOTIVE POWER FOR SEWING AND OTHER MACHINES.—Jacob Zuckermann, San Francisco, Cal.—Patent No. 87,020, dated February, 16, 1869.

NOTE.—Copies of U. S. and Foreign Patents furnished by Dewey & Co., in the shortest time possible (by telegraph or otherwise), at the lowest rates. All patent business for Pacific coast inventors transacted with greater security and in much less time than by any other agency.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s Scientific Press American and Foreign Patent Agency, the following are worthy of mention:

GANG PLOW.—Abram Ellison, Marysville. There are three points in this invention which are noticeable:—the device for raising the plow-frame, and therefore the plows, without the use of the ordinary crank axle, and with the greatest ease; the manner of adjusting the pole, so as to cause the plows to take more or less land, according to the necessities of the case; and the construction of the standard which connects the plows with the carriage. A description without a drawing would hardly be of use here. For the first purpose there is a peculiarly bent arm, bolted to a timber at one end and to a sweep at the other, in combination with a short axle, the sweep being of a peculiar construction; the pole is adjusted by means of a screw rod and nuts; and the standard has its lower end divided and separated, so as to be secured at two points to the landside.

IMPROVED LAMP. Emil Boesch. S. F. Our City Fathers have been making of late some few improvements with regard to the street lamps. There are still two prominent changes, which, if effected, would be of service. The quality of the gas used might be improved, and the light might be better utilized. Mr. Boesch's invention is in the latter direction. It consists in the application of improved reflectors, arranged so as to adjust them nearer or farther from the light and thus give it greater or less range as desired; in providing for a better draft, so as to increase the efficiency of the light; and in an improved method of retaining in place the glass slides, so that they can be removed or replaced readily. By this construction, moreover, the lighting and extinguishing is more easily accomplished than it is now, for the cock for turning on the gas is below and outside of the lamp, and by simply placing a flame inside the perforated reflector, the gas is lighted. The provisions for ventilation prevent any part from being unduly heated, or the flame from wavering or burning badly from want of the proper supply of air.

Reading for the Hour.

Tobacco Persecutions.

Modern lovers of the pipe know little, and think less, of the worthies to whom they are indebted for its free enjoyment; and of those who delight in nasal aliment, how few ever call to mind the Diocletian persecutions their predecessors passed through for adhering to their faith in, and transferring to their descendants the virtues of tobacco! Europe frowned and Asia threatened. Pagan, Mohammedan, and Christian monarchs combined to crush them. James I., foaming with rage, sent forth his "Counter-blast," the half-savage ruler of the Muscovites followed suit; the King of Persia, Amurath IV., of Turkey, the Emperor Jehan-Geer, and others joined the crusade. They denounced death to all found inhaling the fumes of the plant through a tube, or caught with a pellet of it under their tongues. Those who used it as a sternutative only were to be deprived of nostrils and nose. To perfect the miseries of the delinquents, Maffeo Barberini, elected Pope in 1623, went in state to the Vatican, where, trembling with holy anger, he shook his garments, to intimate that the blood of the offenders would be on their heads, and then thundered excommunication on every soul who took the accursed thing in any shape into a church. Loss of life for lighting a pipe! Mutilation for taking a pinch! Tortures here, and endless torments hereafter, for a whiff or quid of tobacco! One wonders how the sufferers managed to pass through the fire unscathed, or even to escape annihilation; yet most of them did escape, and they did more—they converted the Nehuchadnezzars who sought to consume them.

The measures adopted to exterminate the plant increased the demand for it, till it was sought for with an avidity that no penal enactments could suppress. Ladies joined their lords in smoking after meals, boys carried pipes in their satchels to school, and at a certain hour pedagogues and pupils whiffed together (not a bad subject for a painter). Mothers in the sixteenth century filled their sons' pipes early in the morning to serve them instead of breakfast. People went to bed with cigars or pipes in their mouths, and rose in the night to light them. All classes became customers; even priests were not excepted, provided they refrained till after mass. To accommodate travelers—poor and transient persons—"Tahagies," or smoking-houses, were licensed on the Continent in every marine and inland town, where sailors and itinerants could, on moderate terms, be made happy, either by inhaling the vapor of the popular stimulant or tickling their nasal membranes with it. The ambitious sought fame by associating themselves with the introduction of the plant and its cultivation; hence we find it named after cardinals, legates, and ambassadors, while, in compliment to Catherine de Medici, it was called the "Queen's herb." Kings now rushed into the tobacco trade; those of Spain took the lead, and became the largest manufacturers of snuff and cigars in Christendom. The royal workshops in Seville are still the most extensive in Europe. Other governments monopolized the business and reaped enormous profits from the plant, as all do at this day.

In taking leave of the pipe, respect for it might be claimed in behalf of science, since it was the earliest gaslight retort; and one of the authors of the steam engine received his first inspiration from it, and made his initial experiment with it.

Brazilian Indians were the "fathers" of snuff and its best fabricators. The simplicity of their milling and sniffing apparatus has never been surpassed. A leaf of the plant was folded up, laid on a small slab of rose-wood, and ground to powder by rubbing it to and fro with a stick of the same wood, the heat involved by the friction eliciting a delightful aroma from the wood. The sniffing device consisted of two leg-bones of a young crane or heron tied together, and mounted at one end with small wooden hubs. Soon as the triturating process is ended, the hubs are applied to the nostrils, and the other ends to the warm, scented dust, when a smart inhalation diffuses it, in a trice, over the olfactory palate. In Europe, snuff was named after the people from whom it was derived:

"Take out your box of right Brazil." (Pope.)

It was not until the Spanish article arose into favor that the original designation began to decline:

"Yourself for goose reject crow quill.
And for plain Spanish quit Brazil." (Ibid.)

—Amer. Artisan.

An Extensive Appetite.

The following is said to have appeared in *Nature*, which announcement will allow our readers to make as many puns on the subject as they may think fit. It is concerning a French soldier. His first exploit was to eat a basket of apples, at a friend's expense. On various occasions he swallowed a series of corks and other indigestible materials, which produced such violent colic that he was obliged to attend the Hotel Dieu, and, whilst being examined, almost managed to swallow the watch-chain and seals of the surgeon in attendance, M. Girard. Dssault, on the occasion of one of the attacks of colic, tried to frighten him out of his gross habits, by declaring that it would be necessary to open his stomach, and arranged the instruments. He ran away and relieved himself by copious draughts of warm water. Soon after, he found that his appetite had really increased to an excessive amount, probably owing to the continued irritation produced by these absurd tricks. At 17 years of age, when only weighing 100 lbs., he could eat 24 pounds of beef in as many hours. He now entered the army, and, being recognized by the Surgeon-Major, M. Courville, of the 9th Regiment of Hussars, he was detained for curiosity. From the day of his admission he was ordered quadruple rations, with pickings and waste meat; but often slipped into the dispensary to finish off a poultice or two. One day he was observed to seize a large eat; and, after sucking its blood, left in a very short time only cleanly picked bones, the hair being rejected in the course of about half an hour, like other carnivora. He was fond of serpents and eels, swallowing them whole. On another occasion he consumed, in a few minutes, a repast spread out for fifteen German work-people, of milk, etc., after which he was blown out like a balloon. In presence of some officers, he swallowed, at one sitting, thirty pounds of livers and lights. His insatiable appetite was, for once in his life made useful by his being selected to convey a correspondence between General Beauharnais and a French Colonel, which was inserted in a box and swallowed; but he was caught and soundly thrashed. He fell under suspicion of having eaten a child fourteen months old. It is stated that he was of mild and gentle manners and aspect. After death, his stomach was found in a very diseased condition.

Political Changes in France.

The New York *World* summarizes the political changes in France for the last eighty years as follows:

"In 1792 the great French Revolution was inaugurated, Louis XVI. was deposed and all the monarchies of Europe declared war against the young republic. France was without finances, without troops.

"In 1795 the republic had been triumphant everywhere against the monarchical government and had established internal order.

"In 1799 Bonaparte was chosen First Consul.

"1804—Bonaparte Emperor.

"1815—Waterloo and St. Helena, and the restoration of the Bourbons in the person of Louis XVIII.

"1830—The revolution and expulsion of Charles X. for general disregard of constitutional government, and in particular for Polignac decrees against the press. Louis Philippe ascends the throne.

"1848—Louis Philippe abdicates; popular dissatisfaction at peace policy abroad; tampering with elections at home and limiting the powers of the press; and Louis Napoleon elected President.

"1851—Louis Napoleon President for ten years by 7,839,216 votes.

"1852—The Second Empire by a vote of 7,824,129 citizens."

LOSING MUSKETS.—In General Decaen's army, as everywhere, says a French paper, there are, of course, cowards and shirkers. They have made the following little calculation: The loss of a musket in time of war costs a year or two in prison; but the risk of one's life is even more serious. General Decaen has issued the following proclamation: Every soldier who loses his musket will be sent to the advance posts, without arms. He will get a new one only when he has captured the complete accoutrements of one of the enemy's soldiers. When I left Saint Avoird there were three or four fellows of this kind in the advance posts; but not a man in the division has lost his musket since the proclamation.

American Toadies

It is deplorable, but true, that many Americans, who in the United States are rampant republicans and laugh to scorn the divine-right theory, when they get to Europe become sickening toadies to the nobility there, and to all things noble. This has become more and more noticeable of late years, and Mr. F. M. Pixley, writing to the *Alla* from Paris, thus alludes to the matter:

It is a curious fact that of all the apologists for Napoleon—of all the upholders of his dynasty—of all the sycophantic dirt-eaters who crowd Paris and do homage to this bloody humbug, the Americans are the worst. I was conversing to-day with an American banker, and he said, this sentiment of Napoleonism was so common with his clients, the Americans, that he dared not talk politics with them. These idle, rich, loafing Americans, who come to Paris to swell and spend money, seem to think it their duty constantly to apologise for everything American—to laud and excuse every outrage growing out of Imperialism. I am determined to see the game played out even if I am put on half rations. It is a great pleasure to be able to eold on paper, for you may be assured I keep a very close tongue in my head, and dare not even look pleased when I hear of a Prussian victory.

EVERY SATURDAY.—This illustrated journal of choice reading has come to us more prized than ever. The number of September 10th. is unusually full of illustrations,—of stirring war scenes in Europe, of beautiful art pictures and charming portraits. Its able editorials, interesting stories, summary of home and foreign news and miscellaneous articles are particularly happy. The publishers, Messrs. Fields, Osgood & Co., are among the most enterprising and popular in our country, and one may be sure that they will let nothing unworthy of their reputation issue from their house. For a family paper, we know of no journal more to be recommended than *Every Saturday*.

CURIOUS PETRIFICATIONS.—The *Territorial Enterprise* of the 10th has been shown a lot of curious petrifications found in various places between Pyramid Lake and Black Rock. Besides the usual specimens of pine wood containing wood opal, or petrified pitch, as the prospectors call it, there are several things a little out of the ordinary line of such collections. One is a perfect pine hurr, or cone, perfectly white on one side, and of a dark, glossy brown on the other side. At the large end of the cone are fixed some bright iron pyrites. Another is the head of a large bird of the pelican species. Only a portion of the bill remains, but otherwise it is quite perfect. In a stone among the collection—a kind of agate—is to be seen the picture of a small animal, resembling a wolf or fox; several fine moss agates, and a number of geodes containing crystals of various kinds. In the neighborhood where these things were found were seen portions of large trees perfectly petrified and lying upon the surface of the earth, often upon the tops of hills of considerable height. This may appear strange, yet the petrified trees found in this section of the State in 1859-60 were nearly always discovered lying upon the surface of the earth. One tree nearly two feet in diameter and thirty or forty feet long, was found on the side of a high hill southeast of American Flat, and in Spring Valley sections of cedar trees of considerable size were found. The most curious thing in the collection mentioned above is the picture of the wolf in the rock, crystal or agate, which is quite perfect except that the hind legs and tail are merged in one mass.

THE CROWN PRINCE OF PRUSSIA.—It may not be generally known that the Crown Prince of Prussia is a Yale man as to his English education. Professor Thacher, of Yale, so widely known as professor in Latin and so closely identified with all that is Yale, while studying in Germany, was the English tutor of the Crown Prince, and taught him what he knows of the English language. May he ever be worthy of his worthy instructor.—*College Courier*.

BOTTLES. The value of the bottles annually manufactured in the United States amounts probably to nearly thirteen millions of dollars.

Metallurgy and Ores.

A. T. GREEN, COMMISSION MERCHANT,

Manufacturers and have constantly on hand
SPORTING,
MINING,
And **BLASTING**
POWDER,
OF SUPERIOR QUALITY, FRESH FROM THE
MILLS. It being constantly received and transported
into the interior, is delivered to the consumer within a
few days of the time of its manufacture, and is every
way superior to any other Powder in Market.
We have been awarded successively
Three Gold Medals
By the MECHANICS' INSTITUTE and the STATE AG-
RICULTURAL SOCIETY for the superiority of our
products over all others.
We also call attention to our
HERCULES POWDER,
Which combines all the force of other strong explosives
now in use, and the lifting force of the best BLASTING
POWDER, thus making it vastly superior to any other
compound now in use.
A circular containing a full description of this Pow-
der can be obtained on application to our Office.

DESIGNS AND PLANS
—FOR THE—
NEW CITY HALL
—OF—
SAN FRANCISCO.
Office Board of City Hall Commissioners, southeast
corner of Sacramento and Montgomery streets, San
Francisco, June 22, 1870.
The Board of City Hall Commissioners hereby give
notice that they will be prepared to receive at their
office, on or before the FIRST DAY OF NOVEMBER
NEXT, designs and plans for the new City Hall of San
Francisco.
The Commissioners, in order to obtain the very best
design and plan, invite the fullest competition among
architects, and to this end have resolved to offer the fol-
lowing premiums:
First—For the design and plan selected and
adopted \$2,500
Second—For the second best design and plan..... 2,000
Third—For the third best design and plan..... 1,500
Fourth—For the fourth best design and plan..... 1,000
Fifth—For the fifth best design and plan..... 500
The premiums payable in City Hall warrants.
As a guide to architects in the preparation of the de-
signs and plans, the Commissioners have prepared a
pamphlet containing full instructions and suggestions,
as well as the terms and conditions upon which the pre-
miums will be awarded.
Pamphlets can be had on application at the office of
the Commissioners.
Any design or plan in which the requirements of the
Board, as set forth in the printed instructions, have not
been reasonably complied with, will be rejected from the
competition.
P. H. CANAVAN, Chairman,
JOS. G. EASTLAND,
CHAS. E. McLANE,
City Hall Commissioners.

PAIN KILLER
PROP.
1840 1870
The "Pain Killer,"
After THIRTY YEARS' trial, is still receiving the most
unqualified testimonials to its virtues, from persons of
the highest character and responsibility. Physicians
of the first respectability, recommend it as a most effec-
tual preparation for the extinction of pain. It is not
only the best remedy ever known for Bruises, Cuts,
Burns, etc., but for Dysentery or Cholera, or any sort of
bowel complaint, it is a remedy unsurpassed for effi-
cacy and rapidity of action. In the great cities of India,
and other hot climates, it has become the Standard
Medicine for all such complaints, as well as for Dys-
pepsia, Liver Complaints, and other kindred disorders.
For Coughs and Colds, Canker, Asthma and Rheumatic
difficulties, it has been proved by the most abundant
and convincing testimony, to be an invaluable medi-
cine. Directions accompany each bottle.
Sold by all Druggists.
Price 25 cts., 50 cts., and \$1 per bottle.

TARRANT'S
SELTZER
WATER
WEIGH THESE WORDS. All who suffer from indiges-
tion, bilious disorders, nervous affections, constipation
or undue relaxation of the bowels, are invited to con-
sider these facts, viz: That the curative operation of
TARRANT'S EFFERVESCENT SELTZER WATER, in all such
cases, is proven by overwhelming testimony; that pro-
fessional medical practitioners endorse it; that Analytical
Chemists pronounce it identical with the water of the
great German Spa; that it purifies and regulates the
system without weakening it; that it is delightfully re-
freshing, and that every element it contains is either
corrective, alterative, or invigorating. Weigh these
words.

the mechanic arts, and is inferior to no publication of
the kind in the United States.—*Oregonian Astoria.*

Origin of Gold Nuggets and Gold Dust.

BY ANDREW MURRAY, F.L.S.

The origin of gold dust is not so simple or clear as at first sight it appears to be. The natural explanation of the production of the gold dust is that it is the golden portion of the debris of rocks which have originally had gold disseminated through them. As the wear and tear of ages has crumbled into dust mountains so composed, part of the dust becomes sand or quartz, or whatever else the basis of the rock may be, and the other part is the liberated gold from from which the quartz has been rubbed away; and if we accept this as the explanation of the production of gold dust, the same hypothesis should explain that of gold nuggets which are found associated with it.

But there are various circumstances which it is difficult to reconcile with this theory. One of these is the occurrence in the drift of nuggets of a larger size and less intermixed with foreign substances than have yet been discovered in any quartz reef; as most people are aware, the gold in reefs is usually disseminated in particles and strings through the quartz veins of rock, instead of lying in pockets or masses. Another still more remarkable fact, applicable both to gold dust and nuggets, is that alluvial gold is generally of a higher standard than that obtained from the reefs. It is needless to say that if it is merely the gold washed or crumbled out of these reefs, it ought to be of identically the same standard and quality. Another objection to the dust being merely the degraded particles released from the rock is the size of the particles—not nuggets, but particles of dust. Gold being so much softer than quartz, its particles after being subjected to the same degree of attrition ought to be vastly smaller; although of greater toughness than quartz, and possessed of ductility and tenacity which quartz wholly wants, it is very soft, and, under the influence of the attrition from running water and its accompaniments, ought to be pounded and torn into the minutest fragments; but this is not so. There is, moreover, a marked difference in the appearance of the gold dust in different drifts in different countries. In some it is like dust or sand, in others it is like scales. If subjected to the same influences in all, there seems no reason why the same shape should not obtain in all.

These peculiarities would suggest that some other influence than mere degradation of gold charged rocks has been the agent in producing gold dust; but in any and every view we think it cannot be disputed that degradation must have had some share in the work. It is plain that if a gold charged rock is reduced to gravel, sand, or powder, particles of gold of some size or other, or gold in some shape or other, must form part of the debris. These gold remnants should be found in greater quantity and in greater size the nearer they lie to the source from which they were drawn; and this we believe to be also the case. The general similarity between gold-producing districts, by which a California miner could detect a likely spot for gold in Australia or Kildonan, probably depends rather on the character of the mountains out of which the gold has come than on the mode of production of the manufactured dust, if we may call it so. We imagine that the truth will be found to be that the result is referable to two causes, only one of which may in some cases have been present, in others both; the first, the ordinary process of degradation and grinding the rock to fragments; the other, as suggested by Mr. Selwyn, the Government geologist of Victoria, that gold has also been taken up in solution by the water permeating the gold bearing-rocks, and that in passing through the drift, in which minute particles of gold lay, it has from some cause become decomposed, and the gold held in solution being precipitated and deposited around the most congenial nuclei presented to it, which would undoubtedly generally be the particles or pieces of reef gold, or any other metallic substances for which it had an affinity.

We find an interesting paper on this subject in the "Transactions of the Royal Society of Victoria" (1867), by Mr. C. Wilkinson, in which he mentions some facts bearing on the subject. It appears that Mr. Daintree, formerly of the Geological Survey of Victoria, had on one occasion prepared for photographic uses a solution of chloride of gold, leaving in it a small piece of metallic gold undissolved. Accidentally, some extraneous substance, supposed to be a piece of cork, had fallen into the solution, decomposing it, and causing

the gold to precipitate, which made a deposit in the metallic state, as in the electroplating process, around the small piece of undissolved gold, increasing it in size to two or three times its original dimensions. Considering this accidental experiment of Mr. Daintree's as in some measure supporting Mr. Selwyn's theory, Mr. Wilkinson followed it up by a few simple experiments in the same direction, which he details in his paper. In his experiments a small chip of wood was generally used as the decomposing agent. In one instance he used a bit of leather. All through the wood and leather, gold was disseminated in fine particles, and when cut through, the characteristic metallic lustre was highly reflected. From various experiments it would appear that organic matter is the necessary chemical agent for decomposing a solution of the chloride of gold in order to precipitate the gold as a coherent coating around a nucleus; and that, so far as Mr. Wilkinson had yet tried, iron, copper, and arsenical pyrites, galena, antimony, molybdenite, blende, wolfram, and metallic gold constitute essentially favorable nuclei to determine this chemical reaction. It is to be observed, too, that organic substances, such as fragments of wood, roots of trees, etc., occur abundantly in the gold drifts of Australia. If water holding gold in solution circulates through the rocks and drifts, all the conditions necessary for the production of gold dust and nuggets by deposit are present. Does the water so circulating now hold gold in solution? One would think it would not be difficult for a chemist in Australia or California to determine the fact by direct experiment, but it does not appear that it has ever been tried. Mr. C. Wilkinson, however, quotes facts which lend probability to the view that when the trial is made, the question will be solved in the affirmative. In testing a solid mass of iron pyrites, Mr. Daintree found gold throughout. This mass retained the structure of a tree-stem, in which the organic structure was replaced by pyrites. It had been taken from the Ballarat drift, and the same experiment was repeated by Mr. Newbury, the Geological Survey analyst, on another stem taken from the same drift, with a like result. Gold in such deposits assumes a mammillary form, which appears analogous to that presented by the surface of nuggets—a point of some importance for, in the first place, it is a question whether a mammillary surface is the kind of surface that would be produced by abrasion and attrition; and, in the next place, abrasion or attrition can certainly have nothing to do with its appearance in these golden petrifications. We cannot avoid attaching the greatest importance in relation to the question, to the presence of gold in pyrites that has been formed in wood imbedded in auriferous drifts. The gold must have been in solution when so deposited, and everything will then depend on the age of the so petrified wood. If contemporaneous with the drift, the question is answered. Another fact to the same effect is, that sometimes gold encloses a nucleus of brown iron, etc. This is obviously quite inconsistent with such pieces of gold having been absorbed, as they are out of crumbling rocks; such uncolored pieces of gold are never found in reefs. It is the old puzzle of a reel in a bottle.

In relation to this we may remark that we believe that nuggets have never been found in the gold-fields of Brazil. We have the authority of Mr. Harding (a gentleman well known for his great practical knowledge of gold mines and mining in that country) that he never met with nor heard of a nugget properly so called in all his many years' experience in the gold district of Brazil; but, on the other hand, it is there almost invariably found in veins in connection with, or in the vicinity of, some other metal—generally iron. In what is probably the most prolific mine of gold that has ever been known in the whole world, that of San Juan del Rey (the value of which was not very long since so seriously depreciated by the accidental destruction by fire of the wooden ladders, supports, and machinery), the gold is found in a matrix of porous iron or agglutinated iron sand called Jacotinga, which consists of a bed or vein, not a foot in width, but so incredibly rich that on one occasion, when our informant was on a visit to the manager, there was brought in on an assiette, as a sort of dessert for the eyes after dinner, a lump of gold ore that had been extracted that day from the mine. It was about the size of a large fowl, not so big as a turkey, but bigger than a duck. It was a mass of Jacotinga-iron with gold all mingled and streaked through it. The gold when afterwards extracted was found to amount to 30 lbs. weight. On the previous day the amount of gold obtained from

the Jacotinga had been 67 lbs., and on the day following 130 lbs., equal in value to about £8,000. We only mention it as a corroborative instance of the concurrent presence of gold and iron. Lastly, as pointed out by Mr. Wilkinson, it must be admitted that the fact that gold may be greatly purified by dissolving and reprecipitating it, is very suggestive of the generally higher standard of alluvial over reef gold being due to a similar cause.—*Scientific Opinion.*

The New Patent Act.

AN ACT TO REVISE, CONSOLIDATE AND AMEND THE STATUTES RELATING TO PATENTS AND COPYRIGHTS.

APPROVED, JULY 8, 1870.

[CONTINUED FROM PAGE 139.]

Sec. 52. And be it further enacted, That whenever a patent on application is refused, for any reason whatever, either by the Commissioner or by the Supreme Court of the District of Columbia upon the appeal from the Commissioner, the applicant may have remedy by bill in equity; and the court having cognizance thereof, on notice to adverse parties and other due proceedings had, may adjudge that such applicant is entitled, according to law, to receive a patent for his invention, as specified in his claim, or for any part thereof, as the facts in the case may appear. And such adjudication, if it be in favor of the right of the applicant, shall authorize the Commissioner to issue such patent, on the applicant filing in the Patent Office a copy of the adjudication, and otherwise complying with the requirements of law. And in all cases where there is no opposing party a copy of the bill shall be served on the Commissioner, and all the expenses of the proceeding shall be paid by the applicant, whether the final decision is in his favor or not.

Sec. 53. And be it further enacted, That whenever any patent is inoperative or invalid, by reason of a defective or insufficient specification, or by reason of the patentee claiming as his own invention or discovery more than he had a right to claim as new, if the error has arisen by inadvertence, accident, or mistake, and without any fraudulent or deceptive intention, the Commissioner shall, on the surrender of such patent, and payment of the duty required by law, cause a new patent for the same invention and in accordance with the corrected specifications, to be issued to the patentee, or, in the case of his death or assignment of the whole or any undivided part of the original patent, to his executor, administrators, or assigns, for the unexpired part of the term of the original patent the surrender of which shall take effect upon the issue of the amended patent; and the Commissioner may, in his discretion, cause several patents to be issued for distinct and separate parts of the thing patented, upon demand of the applicant, and upon payment of the required fee for a re-issue for each of such reissued letters patent. And the specification and claim in every such case shall be subject to revision and restriction, in the same manner as the original applications are. And the patent so reissued, together with corrected specification, shall have the effect and operation in law, on the trial of all actions for or against thereafter arising, as though the same had been originally filed in such corrected form; but no new matter shall be introduced into the specification, nor in case of a machine patent shall the model or drawings, be amended except each by the other, but when there is neither model nor drawing, amendments may be made upon proof satisfactory to the Commissioner that such new matter or amendment was a part of the original invention, and was omitted from the specification by inadvertence, accident, or mistake, as aforesaid.

Sec. 54. And be it further enacted, That whenever, through inadvertence, accident, or mistake, and without any fraudulent or deceptive intention a patentee has claimed more than that of which he was the original or first inventor or discoverer, his patent shall be valid for all that part which is truly and justly his own, provided the same is a material and substantial part of the thing patented; and any such patentee, his heirs or assigns, whether of the whole or any sectional interest therein, may, on payment of the duty required by law, make disclaimer of such parts of the thing patented as he shall not choose to claim or to hold by virtue of the patent or assignment, stating therein the extent of his interest in such patent; said disclaimer shall be in writing, attested by one or more witnesses, and recorded in the Patent Office, and it shall hereafter be considered as part of the original specification to the extent of the interest possessed by the claimant and by those claiming under him after the record thereof. But no such disclaimer shall affect any action pending at the time of its being filed, except so far as may relate to the question of unreasonable neglect or delay in filing it.

[To be continued.]

A. F. BURR, Sen., an enterprising miner 55 years of age, died at Sutter Creek, Sept. 12th.

ANOTHER MYSTERY SOLVED.—Chemists being unable to discover the ingredients in fragrant SOZOPONT, which removes all stains for the teeth and imparts such a peculiar rosinousness to the gums, the public are hereby informed that it is a preparation from the Bark of the QUILAYA SAPONARIA or Soap Tree of Chili, imported for the first time into this country for this special purpose. Such is the purifying and innocuous effect of this rare botanical agent that it removes discolorations from the most fragile textile fabrics, without injuring a single thread.

Best Illustrated Newspaper
—FOR—
PACIFIC COAST READERS.

The Scientific Press,
[ESTABLISHED 1860.]
A large Illustrated, Practical Scientific
Home Journal, devoted to

Mining, Farming, Mechanic Arts,
AND INDUSTRIAL PROGRESS.

Each weekly issue contains 16 pages (size of Harper's Weekly), except our double sheet, published on the first week of each month, which comprises 24 pages. It is ably edited, and contains, in concise and desirable form, all the most important discoveries, inventions, improvements and developments in the various branches of Science, Mechanic Arts and Industrial Pursuits, interesting to all intelligent readers on this coast. We make a live paper for the times, using plain, comprehensive language, giving information which cannot be had from books, or so readily and cheaply obtained from any other source. Each number often furnishes profitable hints to the reader worth many times its annual subscription price. Please examine sample copies and subscribe at once, and you will not regret it.

Terms, for six months, \$2.50; one year, \$4—payable in advance. Sample copies of the PRESS and illustrated Patent circulars sent free on receipt of postage stamp.

IMPORTANT BOOK!

JUST ISSUED.—Roasting of Gold and Silver Ores, and the Extraction of their Respective Metals without Quicksilver. By G. Kustel, Mining Engineer and Metallurgist; Author of "Nevada and California Processes of Silver and Gold Extraction," and "Concentration of all Kinds of Ore." Illustrated by numerous engravings. Published and sold by Dewey & Co., proprietors SCIENTIFIC PRESS, San Francisco.

This Book contains 120 pages. Price, \$2.50, gold, or \$3 currency, postage paid.

IMPORTANT TO CIDER AND VINEGAR MAKERS.—Wines and champagne manufacturers, Merchants and families. Valuable information imparted relative to machinery, improved process for making Wine, Champagne, Cider, Vinegar, etc., also for refining, fermenting, oxygenating, compounding, etc., fully explained in the Cider Maker's Manual and sent free by mail for \$1.50. Address J. S. BULL, Buffalo, N. Y.

N. B.—Illustrated Circular of Cider Mill Machinery sent free.

CO-OPERATIVE CIRCULAR STORE.—This is becoming one of the most useful institutions in the city, and the Mechanic and Laboring Man fully appreciate it. They are enabled to buy their groceries at a Provisional 25 per cent. cheaper than ever before, and the very best articles in the market. The store is located at 115 Sutter street, Lick House Block.

Mining and Company Advt's.

Eagle Quicksilver Mining Co.—Location of Mine: Eagle Mining District; Santa Barbara County, California.

Notice.—There are delinquent, upon the shares of the following named persons on account of Assessment levied on the twenty-seventh day of July 1870, the several amounts set against the names of the respective Shareholders as follows:

Names.	No. Certificates.	No. Shares.	Amount.
Barkley, A. S.	unissued	1	20 00

PENMANSHIP.

In this useful and very important branch we challenge competition.
PROF. SERENI
Has obtained First Premiums at all the Fairs on this coast where his Penmanship was exhibited, and was awarded the MEDAL at the Seventh Industrial Exhibition of the Mechanics' Institute in 1869 over all competitors. His success as a Teacher is unequalled.

TELEGRAPHING.
The only place in the city where Telegraphing is taught by an experienced Operator. We cordially invite the public to call and examine the merits of the College. Our Institute is patronized by the youth of fifteen and the man of fifty, where they receive instruction in Single and Double Entry Book-Keeping, Commercial Arithmetic, Commission Jobbing, Business and Ornamental Penmanship, Commercial Correspondence, Actual Business, Merchandising, Banking, Importing, Railroad, Steamboating, Mining, Real Estate, Brokerage and Exchange, Mechanical and Architectural Drawing, Telegraphy, Orthography, French, Spanish, Italian, German and English Grammar. No CLASS SYSTEM. Each student receives individual instruction. No Vacations.
Sessions Day and Evening.
VINSONHALER, JULIAN & CO.

A NEW REMEDY.

As this Preparation of these plants, lately made public (Patented June 23, 1870), but long proven in Siskiyou county, Cal., owes its efficiency entirely to its remarkable power of INCREASING THE INSENSIBLE PERSPIRATION, or, in other words, the VAPOR EXHALATIONS from the millions of minute pores of the EXTERNAL SKIN, from the crown of the head to the sole of the foot, it is all important that the direction to pass a sponge, or towel, dampened with saleratus water, under the clothing, twice a week, or oftener, be attended to.

Also, that when taken by LADIES, for IMPROVING THE COMPLEXION, for which it is very successful, that it should be in half doses, often repeated; and that one of the Pills of Citrate of Iron and Gum Myrrh, which strengthen the bottom label of each bottle, be taken at night, much aiding in restoring Color in the Cheeks and Lips. To CHILDREN also, give it "a little and often." It is agreeable to them in any way, but especially if sweetened a bit; and it is admirably suited to their Diseases, which generally are those of the MUCOUS MEMBRANES.

FOR the irritated throats of PUBLIC SPEAKERS, Lawyers, Ministers, Teachers, and
FOR driving off threatened CONSUMPTION and Asthma, all Colds and Coughs;
FOR irritated Stomachs, from Bad Liquor, Alkali Water, Strong Coffee, Saleratus Bread;
FOR humors on the Skin, or MUDDY COMPLEXIONS, or, in a single sentence,
FOR all Diseases of the MUCOUS MEMBRANES, the Surest, and by far the MOST PLEASANT MEDICINE yet found, in its TASTE and EFFECT, is

DR. FURBER'S CORDIAL
OF MOUNTAIN BALM
—AND—
OREGON GRAPE,
Two Plants, abounding on the base of, and on the Mountains surrounding
MOUNT SHASTA, CALIFORNIA,

For all of the purposes of the various PREPARATIONS OF SARSAPARILLA, richer in quality and more efficient as a RESTORER OF GOOD BLOOD, and acting equally as surely,

ECCLESIASTICUS. CHAPTER XXXVIII.
—Verse Fourth—
The Lord hath created medicines out of the Earth
And he that is wise, will not abhor them.

TRADE MARK.

and as well on the LUNGS as on the STOMACH, is superior to other COUGH MEDICINES, by bringing BOTH to bear with the stimulated action of the WHOLE SKIN in throwing off Disease of either.

FOR SALE AT SAN FRANCISCO BY R. H. McDONALD & CO., Druggists.
INVALIDS of any of the classes named above will find this worthy of TRIAL. Its virtues, as above asserted, not being visionary, but improved from the SHASTA INDIANS' knowledge and use of these PLANTS for centuries back, made known by them to us.

Such an invalid, residing at a distance, wishing to try it, had better procure a package of one-fourth of a dozen, which can be done by sending in letter to the above a \$5 greenback, and directing that the package should be sent by WELLS, Fargo & Co's EXPRESS to that office which is nearest to the invalid's residence, and that person will be sure to get it. 3v21-12twr

San Francisco Metal Market.

and

Steamships.

REQUIRES

Fifty Per Cent.

LESS POWER

Than any Blower

Now in use.

One of these Blowers may be seen on exhibition at W. T. Garratt's Brass Foundry, corner of Mission and Fremont street. They are also in use at the Almaden Quicksilver Mine; Gridley's Foundry, Gold Hill, Nevada; Atina Iron Works, San Francisco, and many other places.

CAUTION.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirement of the genuine article.

Quartz, Saw and Grist Mill Irons, Steam Engines, Horse Powers, High and Low Pressure Steam Engines, Steamboats and Propellers, made at short notice.

NOVELTY MILL AND GRAIN SEPEARATOR.

THE undersigned having purchased of the Patents, WIRTS & SWIFT, of Hudson, Michigan, their right to this mill, Patented June 22d, 1869, for California, Oregon, Washington Territory, Montana, Utah, New Mexico and Arizona, wishes to call the attention of FARMERS, MILLERS AND GRAIN DEALERS to one of THE GREATEST IMPROVEMENTS OF THE AGE for cleaning and separating grain. While it combines all the essential qualities of a first-class FANNING MILL, it also far exceeds anything that has ever been invented for the separation of grain. It has been thoroughly tested on all the different kinds of mixed grain, separating all the different seeds in almost a magical manner, placing them in their different compartments in the mill arranged for their reception, at the same time taking out all the Mustard, Grass Seed, Barley and Oats, and making two distinct qualities of wheat if desired, thereby selecting superior, large plump and perfect kernels for SEED WHEAT, and all the small and cut kernels, such as merchantable wheat, is deposited in another compartment. By the use of this Mill a great quantity of wheat usually sown that has been cleaned in the common mills will be saved to the farmer, as the cut or shrunken kernels will never germinate.

The above mentioned Novelty Mill is the only mill known to possess all these superior qualifications, and was exhibited and tested at the last Michigan State Fair held at Jackson, Michigan, September 21, 22, and 23, 1869, and bore away the palm over some thirty other different mills from all parts of the United States, including the famous Dickey Mill of Racine, Wisconsin. All who have witnessed here the operations of the NOVELTY MILL, declare it perfection, and the most beneficial invention to the Farmers, Millers, and Grain Dealers ever introduced on the Pacific Coast. The farmers in Santa Clara County, are loud in its praise, and also in other parts of the State where it is being introduced. No. 1 Mill, complete, is capable of cleaning 25 tons of grain per day; No. 2 Mill, 15 tons; No. 3, 10 tons. A large number of recommendations and certificates of the practical working of the mill will be furnished. Circulars containing references sent free by mail. N. B. Town, County, or State Rights for sale on favorable terms. For further particulars apply to

R. B. STONE, 422 Battery Street, San Francisco.

MACHINERY

THE WILSON
Patent Steam Stamp Mill.

This extraordinary Mill, now so justly popular in the East, is now offered to the miners of the Pacific Coast. Having been in operation now for about two and a half years, the Company feel confident that the

WILSON STEAM STAMP MILL,
For Durability, Efficiency,
AND ECONOMY OF WORKING,
HAS NO EQUAL.

The Wilson Steam Stamp Mill is the only Steam Mill that has had the severe ordeal of practical working, and proved itself eminently successful. It is now in operation in several of the Eastern States and Territories, and gaining an enormous popularity. The whole machine is so simple as to be readily understood by the most ordinary minds. In fact, its simplicity is its durability. The expense of crushing rock or cement with this Mill is less than one-half the expense of any other Stamp Mill, and less than one-half the cost. For further particulars inquire of

FURMAN R. WILSON,
San Francisco.

Or of THE WILSON STEAM STAMP MILL CO., 326 Walnut street, Philadelphia, Pa.

NOTICE.—All persons are hereby warned not to manufacture or use any Steam Stamp Mills that are an infringement on the Wilson Patents, as they will be prosecuted to the utmost rigor of the law.

F. R. WILSON,

20v19-1f Supt. W. P. S. S. M. Co., Philadelphia.

VARNEY'S
PATENT AMALGAMATOR!

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the miller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, passing in and between the grinding surfaces. Thence it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Sellers made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Sellers are invited to examine these pans and sellers for themselves, at the office, 229 Fremont street, San Francisco.

Blake's Patent. THE BEST PUMP for Boilers, Engines, Breweries, Sugar Houses, Tanneries, Mining and Fire purposes, etc., is Blake's Patent PUMP. It is simple, compact and powerful, needs no expert to run it, and will start at any point. Is warranted positive under all circumstances. Send for circular.

CHAS. WEST,

No. 139, 3d Street, S. F. AGENTS—MORRIS & WHITE, 30, Fremont, St. S. F.

Patent Hydraulic Pipe Nozzle.

HARRIS & KLEMMER,
La Porte; Plumas Co., Cal.

HAVE ON HAND AND FOR SALE, a number of their New Hydraulic Pipe Nozzles, recently invented and patented by Mr. Harris.

The cut shows a section of the Nozzle and the lever by the action of which, the different-sized rings, as shown, may be drawn and inserted to change the size of the stream instantly and without stopping it. Experienced miners have only to examine the operation of this improvement and its working effects, to become thoroughly convinced of its importance and value.

These Nozzles are used in La Porte and every mining camp in Plumas county; also the following camps in Sierra county: Morristown, Senes' Diggins, Porte Wine, and at Sucker Flat in Butte county, and in every instance have given perfect satisfaction. Every miner who has seen them work pronounces them superior to any nozzle now in use.

WE have used the above mentioned Nozzles during the present season, and hesitate not to pronounce them an entire success.

S. M. ROYCE, E. W. BOYCE, 11v21-in.

Many other testimonials and highly satisfactory references can be given.

PATENTS BOUGHT AND SOLD ON COMMISSION.
Westfall's Improved Potato Digger.

We ask special attention to this practical and useful in-
vention. Nearly every farmer has felt the want of a ma-
chine to dig potatoes. This new invention fully supplies
that want. The machine being made entirely of iron and
steel will last longer than the farer who buys it. It is
operated by a man and one or two horses and digs one row
at a time. The shovel part of the digger enters under the
potatoes and raises them on to the fingers in the rear,
where the dirt falls through and the potatoes roll back on
to the surface of the ground. The machine is prevented
from clogging by a reel which revolves above the fingers
and carries through the potato vines, weeds, etc. A com-
plete model can be seen at our office. Full particulars in
regard to Machines or Rights furnished on application.

New Gas Light.
This Light takes the place of the candle, the Kerosene Lamp and Coal Gas. Each Lamp is a perfect Gas
Factory, making its own gas as fast as it is required. It is a safe, cheap and beautiful light. Circulars and full
particulars sent on application.
A few good traveling agents wanted to sell this and other valuable Patents.

Hold Your Horses!
By the use of "Burns Patent Safety Bridle" the wildest horse can be controlled with ease. The mildest
bit is used and the horse's mouth cannot be injured.
No restive horse should be driven with any other bridle. Send for descriptive circulars, or call and see the
Bridle. Shop Rights for Sale.

Hunter's Improved Grain Separator.
The best machines to Clean Grain in this world. Prices reduced. Send for descriptive circular and price
list. County Rights for sale.

Fiscus & Arney's Improved Washing Machine.
There is probably more inventive talent employed from year to year on machines for washing clothes, than on
any other class of inventions, and yet at the present day, we have but very few Washing Machines of any prac-
tical utility. The one we are about to describe, however, is not merely a device with a handle and a name but a
real labor-saving machine for practical every-day use. It is simple in construction and more simple in its op-
eration. The tub, or box in which the clothes are cleansed is provided with an adjustable corrugated rubbing
board. This stationary rubber is full of small openings and is placed a little above the bottom of the tub in or-
der that the dirt may be precipitated as fast as removed from the clothes, and leave the garments floating in
clean water. The dirty water and sediment in the lower apartment, can be removed at any time through an
opening in the bottom of the tub without disturbing the clothes. The machine is put in operation by means of a
crank, and the operator is not compelled to stoop and strain over hot clothes, and be splashed with dirty water.
The machine is perfectly closed while in operation. The upper, or working rubber adjusts itself to the smallest
handkerchief or to the largest blanket, without any effort on the part of the operator. While in operation the
weight of the upper or working rubber, is constantly pressing and rubbing the clothes, and the action is rapid
and gentle, not breaking the buttons and wearing tearing the garments. It would be difficult to enumerate in a
brief advertisement all the superior merits of this novel invention. It can be built by any ordinary mechanic, at a
moderate cost, and allow a handsome profit. It was patented April 26, 1870 by Elias Fiscus and Solomon Arney, of
Albion, Iowa. State and County Rights for sale at reasonable prices. Complete drawings can be seen at our office
and full information obtained by addressing

Sheffield Scientific School
Of Yale College, New Haven, Conn.
This department of Yale College, instituted in 1840, and
endowed with the National Land Grant in 1866, furnishes
advanced instruction in the various branches of Mathe-
matical, Physical, and Natural Science.
The School is under the direction of the President of the
College, a Board of thirteen Professors in diverse special-
ties, and six assistant instructors.
Regular courses of study, leading to the degree of Bac-
calor of Philosophy, conferred by Yale College, are at-
tached as follows: 1—CHEMISTRY AND MINERALOGY. 2—CIVIL
ENGINEERING. 3—MECHANICAL ENGINEERING. 4—MINING
ENGINEERING AND METALLURGY. 5—AGRICULTURE. 6—NAT-
URAL HISTORY AND GEOLOGY. 7—ASTRONOMY. 8—PHYSICS.
Advanced students are also admitted to optional courses,
and if already College graduates, are received as candi-
dates for the degree of Doctor of Philosophy.
Tuition, \$15 per year of forty weeks.
The Libraries, Museums, Laboratories and Apparatus
accessible to students, are varied and extensive.
For copies of the Annual Circular and Report, letters
may be addressed to the "Secretary of the Sheffield Scien-
tific School," New Haven, Conn.

A New Turn-Table.

Among recent inventions, the one here illustrated seems to us to be deserving of notice. It is an improvement in turn-tables which possesses some important advantages over any others of which we know.

This improvement consists in uniting into a continuous trans-beam, independently of the central supporting box, the two sections with each other and also with the

so as to allow the table to tip or vibrate. Above the cap-plate is a friction-box, consisting of two circular plates (one fastened to the cap-plate and the other to a socket plate) between which conical steel rollers run in corresponding grooves in the circular plates, to facilitate the rotation of the table.

The outer ends of the beams are connected by cross bars provided with rollers (C, Fig. 1) which swing over a track without touching it, except when the table is tipped out of the horizontal plane.

as the last, turns with a weight of only 1½ lbs. attached by a cord running over a pulley to one of the arms. It is certain that the device has been highly praised by superintendents of a number of important railroads where it is used. Personally, we are inclined to consider it a most excellent affair.

Tables of sizes varying from 9 to 60 feet in diameter are manufactured at the Greenleaf Machine Works, of Indianapolis, Ind., where resides the patentee, Mr. Clements A. Greenleaf.

ions devices: chucks for holding wheels and centering them from the outside, for holding and centering jewels, in fact, any part of the watch; devices for turning pivots or cutting the teeth of wheels or rectifying these where they have been incorrectly made, as too large or too small; etc., &c. In all the operations the use of cement is dispensed with, and when a wheel, jewel or other article is once fixed in position for centering, it can be turned over without losing its center. These are a few of the many points. The device is the invention

GREENLEAF'S PATENT IMPROVED TURN-TABLE.

box, so that they are most firmly secured to, and suspended on this.

The two sections, A, A, Figs. 1 and 2, are of the form shown, and are metallic plates, with holes therein, for the purpose of reducing their weight, and with a flange around the edges except at the two ends to be united. These two ends fit exactly to one another and are fastened at the top by broad-headed tie-straps and keys, and at the bottom by a cross-tie bar, with keys or wedges which serve to secure this cross-tie and also to draw together the faces of the joints. Thus is formed one continuous beam of great strength.

Two such beams are bolted centrally against or upon the ends of a hollow rectangular box (F, Fig. 2), whose ends fit closely under the inner edges of the beam-edges (by which they are overlapped), and support the beams. Projecting strips, cast on the inner faces of the beams, also bear against the sides of the box. To fasten the beams to the box, there is a system of key wedges, projecting through apertures in the beam and fitted with nuts. The beams are also thereby leveled and adjusted with reference to the axis of the pintle and the surface of the cap-box in the central box.

Fig. 2 shows a section of this box. The pintle, D, is bolted to the central pier, B, and on it bears the cap-plate, E. The upper end of the pintle is rounded as usual,

By this construction, the strain comes wholly on the truss-beams and the central box is relieved therefrom. The system of supports relieves the bolts in a great measure from strains resulting from jars or pressure. Displacement of the connections of the beams by violent shocks is obviated. The table may be taken apart and put together with the greatest ease. Moreover the friction is reduced to a minimum. The inventor, indeed, states that a table weighing 25,000 lbs. may be turned with the point of a lead pencil without breaking the point. Another statement is that a table, 50 feet in diameter, weighing the same

UNIVERSAL LATHE FOR WATCHMAKERS.—A most ingenious device was exhibited at the State Fair, which was remarkable as a piece of mechanical ingenuity. This is a machine for all sorts of work necessary in making a watch. It is of very convenient size and shape and can be handled easily by one acquainted with watch-makers work. It consists of a lathe, with a number of tools which can replace one another, as it is desired to work on different parts of a watch. It is the handiest, neatest and most correct thing of the kind which we have seen, although we do not pretend to be authority in watch making. There are many ingen-

of Mr. Erick Lunedquist, formerly of La Porte and now of Grass Valley, a watchmaker of considerable skill and reputation, who in leisure hours during the last nine years, has carefully and intelligently perfected his machine, which was awarded a diploma and a sum of money at the Fair.

FAIRS.—The Montana Territorial Fair opened on the 26th at Helena. There was a procession, a military salute, and an address by Gov. Potts. There were 200 entries, and a large attendance, over 1,800 tickets being sold, on the opening day. Visitors are continually arriving.

The Colorado Territorial Fair, opened on the 27th. The prospects of a fine exhibition are good. Two exhibits are particularly noted. Georgetown has contributed a silver button weighing eleven hundred and forty-one pounds, claimed to be the largest silver button or brick ever taken out in the United States. It was cupelled from 133 tons of ore from Brown & Co.'s mines, averaging \$545 currency per ton. The first National Bank of Denver has on exhibition a bar of gold 12½ inches in length by 6½ in width, and 4½ inches high. It weighs 2,318 ounces, and is valued at \$50,000. It will be exhibited afterward at St. Louis. It will be then sent to the Fourth National Bank of New York.

Communications.

IN THIS DEPARTMENT we invite the FREE DISCUSSION of all proper subjects—correspondents alone being responsible for the ideas they advance.

The Stetefeldt Furnace.

EDITORS PRESS:—In your issue of the 3d instant, while noticing Arey's furnace, you saw fit to remark of the Stetefeldt furnace that, while it was successful, the high rate asked for the right to use it was a bar to its general introduction; nor words to that effect.

You will admit that high and low are relative terms. The charge for the right to use the Stetefeldt furnace is a royalty of \$2 per ton; while the exclusive right to a mining district is assessed and charged according to the extent and known value of such district. For instance, in this district of Reese River, the Manhattan Company paid \$25,000 for the exclusive right; and their present imperfect experience of the efficiency and economy of the furnace, has shown them that double that sum would be a moderate consideration for so rich a monopoly.

The Furnace Company has two reasons for asking such apparently large sums for the exclusive right to a mining district: 1st, because of the value of the territory; and 2d, because it wishes to discourage rather than to promote monopolies in mining regions.

The royalty of \$2 per ton will not appear high or unreasonable when it is known that that sum is not 20 per cent. of the direct saving by the Stetefeldt process. Demonstrated results, both at Reno and at Austin, show that that furnace saves, as compared with the reverberatory, from \$10 to \$12 per ton, to make no mention of other positive advantages on the score of economy. With this fact admitted, is the royalty of \$2 per ton too high, or even high? On the contrary, I feel satisfied that you will agree with me that the rate is reasonable.

For the benefit of persons seeking information respecting the Stetefeldt furnace—the cost of construction and the charge for the right—I have to request that you will insert the enclosed card in your paper.

Very respectfully

B. J. BURNS.

For Stetefeldt Furnace Company.

Austin, Sept. 21, 1870.

Notes of Travel in Nevada County.

[WRITTEN FOR THE SCIENTIFIC PRESS.]

Hydraulic Devices at Little York.

The Empire Hill claims are owned and worked by the Little York Water & M. Co., Geo. H. Atkins, Superintendent. They are now running two sets of Craig's Monitors, but in winter, when water is plenty, they run six. Sufficient fall is obtained without tunneling, a ravine on either side, (on the West, Empire, on the East, Scott's) forming a natural outlet. On one portion of these claims, 500 inches of water are put through a 4 in. nozzle with 320 feet pressure—hardly believable if not seen. Eighteen months ago Monitors were unknown; in that short space of time hydraulic mining has been revolutionized, and still greater improvements are anticipated.

The system of *Under-Currents*, which are used extensively upon these claims, and also at Gold Run and Dutch Flat, are well worth the attention of the hydraulic miner who has not already put it in practical use. It consists of a set of side flumes, arranged close along side of the main flume, which is broken, at intervals, where a sufficient fall can be had; and close to the mouth of the same, open riffles, made of heavy iron bars, are placed, through which descend the fine gravel and and flour gold, and over which pass the large rocks. The under-current has a side connection underneath, and is so arranged as to be wider for the first few feet, to cause the water to spread and run slower, and then the under-current, being heavily charged with quicksilver and completely riffled, naturally catches the gold. In some claims, a succession of these under-currents, 100 in number, exists for from ¼ to one mile, and the very last often pays from \$100 to \$300 per year, for cleaning up. Extensive cañons, like those here at Little York, are only cleaned up once a year the under-currents once a month, and the main flume once a week.

An ingenious iron strap is used in these claims for connecting hydraulic pipe, and for mending the same when accidentally broken. It consists of a strap of sheet-iron, from 8 inches to 2 feet wide, with from one to three buckles, so arranged as to form, (when around the pipe) a sloping keyhole fastened by a key to fit the same. This is certainly the handiest and simplest device for connecting pipe in the country. A pipe, one-half mile in length, as some are, expands and contracts several feet, and naturally twists and throws itself

out of shape and often breaks. By the introduction of this strap every 50 or 100 feet, this is obviated. The two pieces of pipe to be connected are placed from 4 to 8 inches apart, then carefully enveloped with a piece of heavy duck, lapped once and a half around, then around that is placed this iron strap, which reaches about once and a half times around, and keys as mentioned above. Then, when the pipe expands, it closes into the iron strap, and when it contracts it lets out without leaking a drop.

Correction.

"BIG YIELD.—About forty tons of rock from the Greenhorn mine, Osborne Hill, has just been put through the mill. The result is, in round numbers, \$11,000."

The above item was published in the Press under the head of Mining Summary from Nevada, Sept. 3d, 1870, and is an error. It does not do justice to the mine, nor to the mill that crushed it—the Gold Hill Mill of Grass Valley. Wm. J. Crase is Superintendent of this mill, and under his management no one has ever complained, or had reason to complain. As some dozen papers have copied it, and given you credit, please to correct it. It should read thus:

The fourth crushing from the Greenhorn mine, Osborne Hill, of 46 loads of rock, yielded \$75 ozs. of gold, or \$13,926.25—about \$302 74 per load.

Lowell Hill and Vicinity.

Lowell Hill is situated 8 miles east from Little York, and although quite a stirring little place, has no Post Office, but depends upon Little York for their mails. Quite a number of claims here are doing extraordinarily well. The nature of the pay is blue gravel, slightly cemented, deep channel diggings. The pay dirt is obtained by tunneling and drifting, and then washing in the usual way. The Swamp Angel Co., Messrs. Nutting & Cooper, and the Frick Bros., commenced work in 1867. Tunnel in 900 ft. The principal pay is on the bed rock, although the entire deposit pays something from the top down, and some day will be cleared away by hydraulic process. This claim has averaged \$5 per day to the man since they began, and lately it has paid from \$15 to \$20 per day to the man. Some six weeks since they took out one piece weighing 23 ozs. Success to them; they are industrious and deserve it. The Golden Ball Claim, next adjoining the Swamp Angel, is owned by Murphy & Hill. They have their tunnel in 450 feet, and have been at work about 4 years. The character of the pay is the same as at the Swamp Angel, paying well and not for sale. I was shown some beautiful specimens taken from this claim worth from \$40 to \$100. Mr. M. F. Skeahan owns and works a similar claim at Lowell Hill, and averages about the same.

Remington Hill, 2 miles north of this, is made lively (during the season of plenty of water) by H. Knight and comrades. Just now but little is doing. Hydraulic is the process of mining here, and from the indications it must be the same or a branch lead of the Little York diggings.

Aaron Klipstine, the only agriculturist who has dared to pitch his tent in these parts, has made beautiful about 20 acres of a neat little valley one mile from Remington Hill, and is making it pay. In one corner of his ranch is situated a beautiful moss agate ledge, which he allows his visitors free access to.

Bearing west down this ridge, some 7 miles, is Chalk Bluff, which has visible evidences of having seen better days; at present but little or nothing doing.

You Bet and Vicinity.

One mile farther west the famous town from which we take our never-to-be-forgotten by-word of You Bet. Williams, Brown, and Necco & West own the principal claims, all of which are paying well, and are not for sale. As an evidence of this, they each have beautiful residences fitted up close by, equal to that of a retired merchant of your city, which look as if they intended to live and die there. The nature of the pay here is the same as at Little York. Hydraulic is the process of obtaining it.

Red Dog, a once flourishing little camp close by, is now only known by name. But one solitary individual holds a residence here. The different Secret Orders once had Halls here, and these were well filled on nights of meetings. Some have broken up, surrendering their charters. Among the others, the Odd Fellows have moved their building and archives bodily to You Bet, where they are again in a flourishing condition.

I neglected to state above in referring to Little York that the mines and water privileges of the Little York Water & Mining Co. were about to be sold to an English Co. the figures fixed upon the same as its price, I believe, are \$203,000. W. W. Cozens is the trustee of the same.

Three miles a little north west of You Bet is Hunts Hill, a flourishing little camp (of 100 inhabitants) situated on the west of Greenhorn Creek; nothing like the size it was ten years ago, but all are alive here and kicking. Goodspeed,

Tucker & Carney own the principal claim here. They have two bed-rock tunnels, one, 1200 feet long on a sluice grade; the other is in 700 feet on a water grade for work and drainage. The character of the pay is blue cement gravel, that has first to be crushed to obtain the pay. For this purpose they have an 8-stamp mill upon their claims and with it crush 25 tons per day, working in the day time only. They are drifting off only about six feet from bed rock, with the intention of hydraulicizing the balance. They work 16 men. This claim pays very regularly and satisfies its proprietors. In my next, I will give you some notes from Nevada City, the metropolis (or County Seat) of this County, and extend the same up into what the miners call "Gods Country."

L. P. Mc.

A Roasting Furnace.

[WRITTEN FOR THE SCIENTIFIC PRESS.]

EDITORS PRESS:—In view of the high price which, I understand, is asked for the right to use the Stetefeldt furnace, the following description of a very similar one in use in Europe, extracted from the Chemical News (Am. Rep., August 1867) may be of interest to our inventors. It is used for copper, but might be adapted to silver.

"The calcination of the ore takes place in what is called a water furnace. This consists of a fire tower, about 20 feet high, 3 feet in diameter at the top, and 4 feet at the base, built of brick, with double walls, and having a large water tank at the bottom. Around the upper portion are four fire boxes, opening into the tower, which is closed, and connected with a large fan-blower. By these means, besides the supply of air heated by passing between the two walls of the tower, air and fuel, in the state of dust, are carried down into the furnace.

The heating effects obtained are very surprising. In the calcination of sulphuretted ores, only a moderate temperature and a large supply of oxygen are required. The fire tower of the water furnace being heated to redness, the ore, with or without pulverised fuel, is driven by a small fan down the tower. The sulphur and base metals are rapidly oxidized, and the calcined ore falls into the watertank below, the current of air being carried through successive chambers open to the tank beneath. In the case of sulphuretted ores of copper, the watertank is filled with a solution of the chlorides of sodium and calcium, by which, with the aid of a spray wheel at the end where the current has exit, the sulphurous acid is absorbed, and the oxide of copper converted into the dichloride. Mr. T. Starry Hunt finds the reaction to take place according to the following equation:

The dichloride of copper is held in solution by the chloride of sodium. A small portion of protochloride of iron generally occurs in the solution, which is separated by addition of oxide of copper, according to this equation:

The addition of milk of lime precipitates the whole of the copper as hydrated oxide; simultaneously the bath is regenerated."

It will be seen that the chief difference between this furnace and the Stetefeldt, is, that the current of air passes downward, instead of upward, through the shaft. Now why cannot silver ores, and auriferous sulphurets be treated in such a furnace, with or without the watertank beneath?

C. H. A.

In The White Mountains.—No. 2.

BY ALMARIN D. PAUL.

Deep Spring Valley Mines and Processes.

Deep Spring Valley Mining District is some 15 miles in length, and about 20 in breadth, reaching, as it does, from the summit of the range, to the Nevada line. The ores contain gold and silver associated with lead, antimony and arsenic mainly; in some localities copper predominates with a small sprinkling of other metals. The ledges vary from 2 inches to fourteen feet, the general width ranges from 6 to 3 feet. Some ore is exceedingly rich, and assays can be had to make any figures from \$500 to \$5,000 per ton; but taking a common sense view of the ore, it is safe to say that the district will furnish thousands of tons that will run from \$20 to \$100 per ton.

Perhaps those who may be interested in the district, will say I am doing injustice by not reporting big assays, instead of taking about \$20 ore; but I would say, in answer to this, that all humbugging work is of no avail in the face of facts; that no district proves such blandishment true. White Pine, for about 6 months, (to take similar accounts) assayed from \$1,000 to \$10,000 per ton; but, after practical operations have been entered upon, what are the facts? White Piners can answer. All mining statistics show that the average of any district does not reach \$35 per ton, and that there are 20 tons of ore worked that do not reach \$25, to one ten that goes above this amount; and further, that \$20 ore will make fortunes for its owners, providing fire has not to be used. With such facts staring us in the face all the time, what is the use of using such unreal figures? heating up brains that have got to be cooled by sad disappointments. This is one of the follies which have given such a damper to the mining interest. But I am off my subject.

As a mining district, I will say there are more leads to every square mile than in any other district my feet have trod upon. In fact I will say further, that in this belt of mountains from Columbus District to Cerro Gordo, and below, a dis-

tinued of some 200 miles, the extent of the mining interest is unlimited and inviting. The only works in Deep Spring Valley District are located on Wyman Creek. There are two Mexican Basas, which amount really to nothing, as they are run only semi-occasionally, and one arastra, which works a few hundred pounds per day and does something for its owner. The only important work is the mill of the Deep Spring Valley M. Co., now under the superintendence of Mr. George Langridge. This consists of a 5-stamp battery, has good water-power and commodious buildings, and really is a better institution than one would expect to find in so now a locality. The mill is now working the Paul Process. As the ore contains a percentage of lead, it was impossible previously to bring the bullion above 20 cents per ounce, and this otherwise complicated the working. Since the Paul Process has been introduced, not only are better returns made, but the bullion goes not less than \$1 25 per ounce. This process works ores dry,—dry crushing—dry amalgamating and precipitating metals, by electricity. As this has been previously explained in the Press, it is unnecessary to say more.

Before ever the mining interests get righted in California and Nevada, we have got to save a higher percentage of metals than we do, by saving the fine gold and silver. This we have got to do by working the ores dry; if not dry amalgamating, as by my process, yet it must be reduced dry anyhow. This putting a stream of water to carry the finer metals off down stream, or to be kept under extreme agitation must be stopped before we can make money. The loss to California and Nevada is too enormous to think of. Miners shut their eyes to facts, pocket what they can, foot up profit and loss account, and too often find loss ahead, and quit. We want care and perfectness in working, by whatever mode it is done. In Nevada they rush it "because it is low grade ore," without thinking that by rushing it, it always will be "low grade."

Among the mines of note in this district, I will notice the Tennant, Miller, Eastern Slope, Cinderella, Victoria, Blue Bird, San Juan and Burgans. But this letter is long enough.

The White Pine Smelters and the Mining Interest.

[CONTINUED FROM PAGE 213.]

The prices offered are so far below the intrinsic value of these ores, to say nothing of the cost of extracting them from the mines, and transporting them to the furnaces, that no man can live by his labor in the Base Range. A man with a family dependent upon him for support, loaded a wagon with a couple of tons of ore, of a quality that had previously commanded from 20 to 30 dollars per ton, and took it to Hamilton expecting that the new company would pay something near its value, when offered to them. What was the poor man's astonishment when told that he could have \$8 a ton for his ore! He shoveled out his load and took his departure, with a vow that this company should have no more at any price.

Now these carbonates have yielded in silver an amount all the way from \$10 up to \$200 per ton of ore, and from 20 to 70 per cent of lead, besides a large percentage of copper. To expect the miners to deliver this ore at their own cost, for such a trifling proportion of its real value, is preposterous. When appealed to on the subject, the miners were told that the company would pay more when compelled to do so. It thus appears that the company mean to take advantage of the necessities of the miners, so long as such necessities exist; and when ores have become scarce through the effects of their system, they will offer higher prices. A significant illustration of human selfishness this!

From the above facts, it is easy to deduce the fate of this mining district. In the Base Range proper, there are not twenty-five men at work in their claims at this date. On the spur of Treasure Hill, there is a still less number. On White Pine Mountain, about twenty men are at work. Even these, having ascertained that they must transport their ore a distance of eight miles to Hamilton, and "trust to luck" and the generosity of the smelting company for a proper remuneration, will soon cease to work.

An effort is being made by the officers of the White Pine Smelting Co., to organize a new company in New York to run their works. It will be remembered that this company has recently failed, and settled its obligations at from 30 to 50 cents on the dollar. This, in addition to its failure to encourage mining in this district, and its efforts to reduce the compensation of miners to a minimum, should be not a very good recommendation for the Company.

The Alsop Co., before ceasing operations, to its credit be it said, paid every debt to operatives and miners, and at the highest prices.

The Rathburn Bros. stopped work with their furnace, sent nearly all their bullion away, and then followed themselves, leaving the worn out furnace to settle all demands against them.

Several other furnace operators have done the same thing, only with less loss to the mining community.

It is not that "the bottom has fallen out of White Pine," as some have asserted, nor even out of the furnaces; but that the pseudo-capitalists who have tried smelting here as a business, have had neither bottom nor integrity. This is the true reason for the long contained depression of our mining interest. Now that there seems a prospect of works of some pretension and capacity, with abundant capital to run them, soon being completed, it is a pity that the managers should not understand their own interests better than to discourage mining altogether by a parsimonious policy, which can have no other result than to drive every minor out of the district.

MINER.

Mechanical Progress.

"METALINE" DEFINED.—The patent specification of this anti-friction composition has been published. The invention consists in intimately mixing together two substances, each in a state of minute division, the substances being of such a character, relative to each other, that the particles will not unite; thus, by destroying or nullifying the natural coherence of the particles of each, making them more or less free to move upon each other; the mixture, however, being subjected to such a pressure that it will have sufficient solidity to serve as the material for, say, a journal box. The number of different combinations which may be made is almost infinite. The claim covers all such combinations, upon this principle, of any materials whatever, as will answer the purpose required, viz., the lessening of friction and of heat to such a degree that no oil or other lubricant is needed. We give one of the fifteen "examples" of the mode of preparation which are included in, or incorporated with, the specification:—"Take of iron fifty parts in such a state of division that it will pass through a sieve with at least ten thousand holes to the inch. It is well to protect the surface of the particles of the powdered iron from oxidation before it is compounded with the tin by covering them with any oily substance. Half of one per cent. of paraffine intimately mixed with the iron dust in a heated mill will prevent oxidation of the particles for months. Then take of tin fifty parts, which it is preferred to have as finely divided as the iron, but its high pulverisation is not so necessary as that of the iron for obvious reasons. These metals are then intimately mixed by grinding or otherwise, and the mixture subjected (in steel or other suitable moulds) to pressure to give it the required solidity, say about sixty tons per superficial inch. The required consolidation will be determined by the use to which the resultant "metalline" is to be applied. The proportions given will be found to be those most generally serviceable, but they may be varied to meet the various conditions under which the metalline is to be used."

A NEW CONDENSER.—*The Engineer* of Sept. 2d, gives an illustrated paper by Mr. Henderson in description of his conical surface condenser, and remarks that it opens up an important question. We quote from the paper enough to indicate the principle upon which the new condenser is constructed:—"I consider this condenser to be simpler in construction and more effective than the one in present use, by reason of its shape, as the whole jet of exhaust steam is brought to impinge instantaneously upon a large and unbroken surface, which causes immediate condensation; whereas, with the tubular surface a very small portion of it is brought into immediate contact until the steam has passed down through the tubes, thus prolonging the process; hence the great quantity of surface required to cool the escaping steam to the necessary temperature. I have had this condenser constructed along with a tubular one—the cone representing 3ft. surface, and the tubular 15ft.—and have compared their respective efficiency, every other condition being kept alike for those models. After six different trials had been made, and an average of the results struck, I found that 1ft. of surface in the cone condenser was equal to 3½ft. of the tubular one. * * With a condenser on this principle a great saving of original cost is effected, and it is much more easily overhauled, as by taking off the door at any time the whole condenser can be examined in two hours; whereas at present when the tubular condenser requires to be cleaned it takes from three to four days, and in many cases a fortnight. Again, the risk of leakage is greatly lessened from the very few joints in the cone condenser, these being only seven in number; whereas the tubular condenser contains many hundreds."

FOUR HUNDRED SEWING MACHINES A DAY.—*The Iron Age* of Sept. 15th has the following:—"The Howe Sewing Machine Company, of Bridgeport, are completing a new building three hundred feet long and three stories high. During the six days ending August 20th, the records in their office show a production of 2020 sewing machines, and during the six days ending August 27th, a total production for the week of 2429. This is an average of a few over 400 machines per day."

HOMOGENEOUS IRON IN LARGE MASSES.

A new arrangement was described in a paper read before the Cleveland Institute of Engineers. Briefly stated in the *U.S. Railroad Register* it is this:—A welding furnace stands between two powerful horizontally-mounted cylinders; one carrying an anvil-headed piston rod, driven by a hydraulic valve box; and the other carrying a hammer-headed piston rod driven, in the ordinary way, by steam. Two side doors, opposite to each other, in the walls of the welding furnace, permit the entrance of the anvil on the one side and the hammer on the other. A man works the hammer, and a boy the anvil. "Ball after ball of the charge of No. 1 puddling furnace is introduced as rapidly as possible into the welding hearth. The whole time of transfer need not exceed five minutes. The whole charge being in, the attendant introduces a hook through the hole in front and draws a ball in line with the anvil. The steam ram gives it a few light taps. The iron soft, the furnace hot, the flame playing round the ball, no oxidation taking place, and the surfaces to be welded vertical, the cinder flows out as water from a sponge. Another ball is drawn into contact with the first, and the hammer brought into play. The anvil is then withdrawn a little to find room for the next ball, which is added to the first two, and finally we have the contents of the two puddling furnaces welded into a single bloom, weighing some seven hundred weight, and of the same consistency throughout."

NEW PIPE-JOINT.—A recent French invention is thus described:—"Serrations are formed around the ends of the pipes for a length of 3 or 4 inches. The ends are then inserted in a hollow cast-iron collar, being made to butt against each other. On the inside of the hollow collar projections are cast which nearly correspond with the serrations on the ends of the pipes. An annular space is thus formed around the butt-joint, which is filled in through a hole in the collar with cement in which sulphur is the leading ingredient. This is poured in whilst in a liquid condition and quickly sets without shrinkage, forming a hard compact mass which, filling the spaces between the serrations, prevents the pipes being withdrawn. To open a joint the application of heat is all that is necessary, when the collars can be slipped backwards."

DUST FUEL.—*London Engineering* describes Crampton's furnace at Woolwich, and his arrangements for burning dust coal, now for the first time a complete practical success. We quote and condense: "The powdered fuel is fed from a hopper by a pair of smooth feeding rollers, and falling, is distributed to a series of pipes, through which it is injected into the furnace by means of jets of air supplied by a fan. The jets enter the combustion chamber horizontally, opposite the bridge, and by a simple arrangement it is insured that the mixture of air and coal dust shall be perfectly equable throughout the entire width. The chamber is simply formed by placing a firebrick bottom where the firegrate is ordinarily situated, provision being made for tapping at intervals the slag which accumulates from the melting of the foreign matters mingled with the coal dust. By means of a damper in the chimney the draught can be adjusted. The furnace has turned out fifty successive heats, averaging 30 cwt. of blooms per heat, without the bandlee governing the supplies of air and coal ever having been moved. The weekly averages have shown a consumption of but 6 cwt. of coal per ton of iron turned out, this being done with dust coal obtained by grinding common slack, costing several shillings per ton less than the coal ordinarily used. Various experiments have been made for the purpose of showing the heat obtainable. Thus on one occasion there was placed in the furnace, in a pot, 25 lb. of puddle bar which contained 0.04 per cent. of carbon. This was melted in one hour and forty-five minutes."

ALUM IN THE PRINTING BATH.—*Anthony's Photographic Bulletin* advises a combination of alum and nitrate of silver for a printing bath for albumenized paper. We quote:—"Every photographer knows how invariably a scum forms upon the surface of a silver solution which is not constantly used. By the use of alum this scum is entirely prevented, the double solution appearing to have the quality of more perfectly coagulating the albumen. As a consequence the paper keeps its whiteness in hot weather much better than when the simple silver solution is used. In preparing the solution it is merely necessary to add as much alum as will dissolve."

Scientific Progress.

LEAVES DO NOT ABSORB MOISTURE.—M. Prillieux has recently given the French Academy the results of some experiments which seem to prove that leaves do not absorb moisture from the atmosphere, and that nearly all the water which a plant receives must therefore be taken up through its roots. We give one of the experiments. "Five leaves of common Mallow, completely wilted, were cut from the stem so that their footstalks were quite long. The section was protected by mastic so that no absorption could take place from the cut surface. The leaves weighed 5.98 grams. They were suspended in a large bell glass in air saturated with moisture. In three days the leaves had recovered their fullness, and become firm and fresh. They weighed, however, only 5.58 grams, having lost 40 centigrams, thus showing that they had not absorbed any moisture from the air; on the contrary they had lost instead of gained, although no longer wilted." A number of similar experiments are detailed. The upper leaves and the small secondary branches, and, in general, the youngest parts, become fresh soonest. The stem, in a part of its length, shrinks upon itself, and assumes a shrivelled appearance, but this does not extend as far as the top. This shows that the youngest parts and those nearest the summit regain their freshness at the expense of the lower portions. The moisture which thus rises to the top is not of course so soon removed in the humid atmosphere, as in the open air."

SULPHUR IN ILLUMINATING GAS.—The first report of the London Gas Referees shows that the present processes for sulphur purification are so defective that in most cases they make no difference whatever in the amount of sulphur present, and in some cases the gas was found to contain one third more sulphur after leaving the purifiers than before it entered them. Professor Silliman remarks upon this Report in the Sept. number of the *American Chemist*. We quote:—"There is no question as to the power of oxide of iron and lime to withdraw a large portion of sulphur from gas under certain circumstances; but it is evident, from the facts already obtained in these experiments, that an adequate knowledge of how to apply these purifying materials in gas-works, so as to produce satisfactory results, has as yet to be acquired. Laboratory chemistry is obviously at fault here; no appreciable advance has been made in sulphur purification during the last ten years; and the real means of improvement must be looked for in experiments on a manufacturing scale in the gas-works. * * Rev. Mr. Bowditch describes his method of removing the 'sulphur impurity,' i. e., the sulphuretted hydro-carbon series of gases—by means of a tube containing quicklime heated by a lamp-flame or furnace, over which the gas to be purified is passed—and the sulphur removed by the lime at a high temperature. Additional researches are demanded in this direction, and if so low a temperature as 500° F. will effect the change, it is certainly possible to devise a process which can be employed in the gas-house in a large way to desulphurize the whole make of the largest gas-works."

ELECTRO-COATING IRON WITH COPPER AND BRASS.—"The electrolytic brass bath consists of an aqueous solution of equal parts of ammonio tartrate and potassic cyanide. After receiving cyanide of copper and cyanide of zinc in certain proportions, the oxides of the metals are added to the solution. If upon trial, this solution works with the evolution of hydrogen, a little of the blue ammoniuret of copper is added to the cold bath. The heat that may be used to this bath determines the color of the brass, and may vary from 60° C. to nearly boiling point."—*W. H. Walenn, F. C. S.*

STALE WINES UNWHOLESOME.—J. Guyot, in pointing out the unwholesome character of wines to which, for the purpose of exportation, alcohol has been added, says that all animal and vegetable products, when brought to a state of chemical purity and stability, are unfit to serve as food, and that to make a wine keep is to kill it. It is a well-known fact that many small wines are only good during their first year of existence. Such a wine is active; and it is just that activity which makes it a wholesome beverage.

BIRDS AND INSECTS BECOMING WISER.

M. Pouchet, the Director of the Museum at Rouen, and a well known naturalist, has discovered that the new school of swallows are improving their style of architecture, building their nests with more regard to sanitary principles, so as to contain more room and admit more light and air. * * A parallel instance in bees is noticed by Dr. Ogle. The arrangements for the cross-fertilization of the flowers of the heath and other papilionaceous plants by bees, are well known, as also the fact that bees have the trick of evading their duty by piercing a hole in the side of the calyx of heath-flowers, so getting at the nectar by a short cut. Dr. Ogle has remarked that while some bees visit the blossom in the natural way, and in so doing take pollen from the anthers of one flower to the stigma of the next, others avail themselves of the shorter cut; but that an individual bee, visiting a succession of heath flowers, uniformly does either one or the other. It would thus appear that the habit is not an instinct, belonging by inheritance to the whole species, but is in each case the result of individual experience.

MUTUAL INTERPENETRATION OF ATOMS.

Prof. Walling read a paper at the late meeting of the American Association upon "the assumption that matter is impenetrable." The *American Chemist* makes this note of it:—"He assumed that the true cause of the mutual resistances manifested when one body is made to encroach upon the space occupied by another is that atoms gravitate toward each other and that no resistance is offered by one atom to the occupation of the same space by another atom. It follows from these assumptions that the momentum acquired by mutual gravitation would carry each atom through and beyond the position of the other; a tendency to subsequent separation of enormous intensity would be produced, and it is this dynamic tendency to separate—constituting a virtual repulsion—and not impenetrability or real repulsion, that causes the apparent resistance to mutual interpenetration."

CLEARING OF MUDDY WATER.

Dr. Cb. Schloesing states that water, otherwise pure but contaminated simply with elsy, becomes at once clarified by very minute quantities of some salts of lime. 1-1000th part of chloride of calcium for 1 part of water effects this purpose in a moment; the nitrate, bicarbonate, and caustic lime act in the same manner. The precipitated substance may be readily separated from the water by filtration, whereas the filtration of the water containing the suspended matter is very difficult, because the pores of the filters are choked.

BOG IRON ORE.

Referring to Prof. Winchell's statement that the bog ores of Michigan were deposits in lakelets, the *U.S. Mining Register* says:—"The fact has been made patent by all our observations for the past forty years, that the exceedingly ancient (palaeozoic) Coal Measures, or Sub-carboniferous ore strata were local deposits of iron in peat bogs, in small ponds or lake-like expansions, in drift sands (whether sub-aqueous or sub-aerial drift is another question); covered over afterwards by the Coal Measures proper; then chemically converted into blue carbonate beds; then uncovered and cut into by the general erosion of the hill and valley surface; and when so exposed, reconverted through the lapse of all subsequent ages into the brown hematites which our furnace men so like."

GLACIERS OF SCOTLAND.

We find this note in *Silliman's Journal* for September:—"Prof. Uroll, in a memoir on the 'Boulder-clay of Caithness,' takes the ground that the boulder drift of Scotland is due mainly to glaciers, and not to ice-bergs, and points out the direction of the movement of the great glacier, not only over Scotland, but over the seas north and east, illustrating the subject by a map. He finds an argument for its glacier origin in the fact that the drift is *unstratified*, remarking that depositions from icebergs would necessarily be more or less stratified by the waters in which they fall. The argument is one that cannot be set aside, and holds as well for New England and the rest of North America as for Scotland. Prof. Dana, in his recent paper on New Haven Geology, draws the same distinction between the drift that was deposited by glaciers over the land, and by glaciers over waters."

Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

California.

ALPINE COUNTY.

TARSHISH.—*Miner*, Sep. 17th: The work of raising a shaft to connect with the old works above has been commenced.

The ore in Monitor tunnel No. 3, is improving materially as the drift next the casing gets deeper under the mountain. The new furnace and air pipe work splendidly.

GLOBE.—We learn that this company will put up a mill of 25 ton capacity this Fall. The ledge is 20 feet thick—and easily mined.

MORNING STAR.—Work has been commenced again. John Landers, on Monday went up to get everything in order and pump out.

AMADOR COUNTY.

RICH ROCK.—*Ledger*, 24th: We understand that the men sinking the shaft of the Coney, struck very rich rock Wednesday.

MORE MINING.—Beldin, Hatch & Co., have taken hold of the Kearsing mine and set men to work.

BUTTE COUNTY.

CHEROKEE.—*Record*, 24th: The work of laying the 30 inch pipe for the canal of the Spring Valley company, is progressing rapidly. Four teams are hauling pipe from Oroville, and four more delivering it on the line of the ditch. Mr. Lathrop expects to have the pipe in readiness to receive water as soon as the wet season sets in.

INYO COUNTY.

BULLION.—*Independent* 19th: The shipment of fine bullion, last week from the earstage, was 4,050 ounces.

LASSEN COUNTY.

BIO VALLEY.—*Yreka Journal*, 21st: Haskings, Ehlers & Co., are down seven feet, and find the claim paying as rich as ever, but short of water. When our informant left, they had eighteen pounds of gold amalgam, and dirt ready for washing, which contained between seven and eight thousand dollars.

The Susanville *Sage Brush* of the 10th, says of the Big Valley mines: Mr. Miller informs us that the owners of the original claim were hauling the dirt a mile and a half to some springs, and washing out \$175 to \$350 per day with two rockers. They were about to commence hauling the dirt to Willow Creek, four miles. Mr. M., says there is much ground which will pay from sixteen to twenty dollars a day if water could be obtained.

MARIPOSA COUNTY.

PINE TREE MINE.—*Gazette*, 23d: This mine, the most important on the Mariposa Estate, is opened 1500 feet into the mountain from the mouth of the new tunnel, and below that has three working levels at intervals of 80 feet, carrying the present workings down 240 feet below the new tunnel. The vein averages six feet in width and exhibits free gold all through it. The rock at the several levels is raised by steam power to the chamber in the new tunnel, poured into a car, and run out on a tramway to the mouth, where it is emptied into a car on the railway leading to Benton Mills. The average quantity taken out is fifty tons per day, giving employment to seventy-five men. This mine was never more promising.

RICH VEIN.—We learn that exceedingly rich rock has been found in the tunnel on the Eclipse mine, North Fork of the Merced. It prospects over \$100 per ton. The mine is owned by P. Winants, of San Francisco.

NEVADA COUNTY.

PROGRESSING.—*Gazette*, 20th: The Ynha Gravel company are down 75 feet with their shaft. They have passed through one layer of gravel 17 feet thick, and are now in hard pipe clay. They expect to reach bed-rock at 110 feet. It will take two weeks.

BRANCH MINT TUNNEL.—This has now a length of 425 feet, and will require 50 more to strike the ledge at a perpendicular depth of 130 feet.

ORLEANS QUARTZ COMPANY.—*Transcript*, 20th: This company have let a contract for setting the engine and boiler of their hoisting works, and for erecting a building. They propose immediately to sink one hundred feet deeper.

OLD SOOGS.—This mine is likely to pass into the hands of parties who intend to put up machinery for pumping, and open the claims below the head of Deer Creek.

DEVIL'S CANYON.—Same of 21st: This is in Eureka Township. The middle tunnel of the Grizzly mine is being worked and first-rate rock coming out. Kelsey,

Myers & Powers, have leased the mine and have out 60 tons of rock. By the end of the week they will have 20 tons more, and will start the mill on Monday. The Prospect ledge at last crushing paid \$25 to the ton, and some of the rock prospected as high as \$2,000. This is a new ledge. Another which shows 30 feet wide on the croppings, is being opened. The tunnel is in 80 feet and will tap the ledge in 25 more. In the same vicinity splendid gravel prospects have been obtained. The gravel is blue and contains wash gold. The lead is 100 feet wide.

EMPIRE MILL DESTROYED BY FIRE.—The Grass Valley *Union*, 22d: The destruction of the mill and the main hoisting works, with a large quantity of supplies is complete. The ground on which the magnificent mill stood is completely swept. The entire loss to the company, after a careful estimate, is \$140,000. The mine has been paying well, and therefore damages will be rapidly repaired. The mill and machinery were insured, and not the hoisting works and machinery, nor the wood on the ground, nor the company's office. The loss at the mill alone is above the insurance, which is \$40,000.

BRYAN LEOEE.—We notice continued improvement. A new shaft has been put down which reaches the depth of seventy feet. The ledge is three feet thick, and shows well in mineral.

HOPE GRAVEL.—*Union*, 25th: We yesterday saw a nice little dahl of dust from the Hope Company's claims. Sixty-six ounces of regular river channel gold, were taken out in the three days, two men running the breast.

EUREKA DISTRICT.—*Transcript*, 27th: Graniteville has a good prospect before it. Black & Co's. mill is running constantly and crushing first rate rock. The Erie Co. has out 150 or 160 tons of rock, and will start the battery during the week. The Birchville Co. are sinking, and expect to strike the ledge soon.

METROPOLITAN.—This mine is between Moore's and Orleans Flat. They have a first rate ledge and a considerable quantity of good rock out. The new double battery mill will start up next week.

PLACER COUNTY.

LAST CHANCE AND VICINITY.—*Stars and Stripes*, 22d: The editor has made a visit to that region. There are in Last Chance no awning-post whittlers. Everybody is at work, and business is healthy. At Star-town, one of the suburbs, the main street is not exactly perpendicular but is still far from horizontal. The river runs swiftly a thousand feet below. The work done in the Morning Star mine and the adjoining of Yule & Co., is no child's play. Bedrock of flinty hardness has been penetrated for hundreds of feet to enter a basin of vast extent, filled with boulders of enormous size. The deposit in which they are working is wonderfully rich and has paid with extraordinary regularity. It will take the labor of a lifetime to exhaust the pay gravel in those two claims, and there is every indication that the channel extends for miles. The is from the size of apple seed to pieces weighing ounces, and is of unusual purity, selling at Michigan Bluff for eighteen and one-eighth dollars per ounce.

GOOD YIELD.—*Herald*, 24th: Miller, Nichols & Mannel had twenty-six tons of quartz from their old claim near the old Crossus, crushed this week at the Ophir, which yielded eighty-five ounces, of amalgam, reckoned at \$900 in gold, making \$34 to the ton. The previous crushing from this claim gave \$20 per ton.

SAN DIEGO COUNTY.

JULIAN DISTRICT.—*Cor. of Alta*, 17th: We now have three mills—two running constantly on custom rock, the third will be ready to start in ten days, and will only crush the rock of the Stonewall. The Owens mine has a shaft down sixty feet and a drift to cut the ledge at that depth, where they are taking out very rich ore. The last batch of 100 tons yielded \$30 to the ton. The Washington has a shaft down thirty-five feet, and are taking out very rich rock, which is being hauled to mill. The last crushing yielded \$107 per ton. The Hayam has run a tunnel 100 feet, cutting their ledge at a depth of 75 feet. They are taking out fine ore. The last crushing showed \$20 per ton. The California has one of the richest bodies of ore in the district. The Helvetia bids fair to become the main ledge. Two hundred tons recently milled yielded \$21 per ton. The Montezuma is supposed to be the extension. The Van Wert has a shaft fifty feet deep. They show a firm ledge with rich rock. At a recent crushing this ore was found to yield thirty dollars per ton. *We want more mills.*

A San Diego telegram of 23d, says that during August, two mills at Julian City

crushed seven hundred tons of ore, which averaged thirty dollars per ton. The placer diggings yielded \$3,000 worth of gold dust, making a total of \$24,000.

SHASTA COUNTY.

UPPER SACRAMENTO.—*Courier*, 24th: Sim Southern came down Tuesday, bringing several purses filled with gold dust, or rather nuggets, some of them weighing from \$10 to \$32. A portion of this was taken out of claims on the river, but the heaviest was from a stream called Mears' Creek. This empties into the Sacramento above Southern's Ranch, is fifteen miles long, and undoubtedly contains pay from its mouth to within seven miles of its source. Fifty men can get claims there for the taking.

SIERRA COUNTY.

GIBSONVILLE.—*Cor. Butte Record*, 24th: A number of miners are prospecting on the Plumas side of the Gibson Ridge, at Point of Rocks. They think they have struck diggings, and the Surveyor has been measuring off claims.

GIBSONVILLE.—*Cor. of Messenger*, 24th: The North American claims are handed to the agent of an English Co. for \$97,000, to be conveyed after next season's washing up—in case the cash is forthcoming; and the Niagara and Vermont claims are similarly handed for \$24,000. The conveyance to be made in fee simple. The North American claims are 1,600 feet in width, running a mile more or less. They are standing higher in the market than heretofore, on account of the completion of their new tunnel, and the large prospects from it, two to four dollars a car load. The Niagara claims are believed to be good, being upon the same channel with the above. The Ne Plus Ultra have their reservoir, ditches, and sluices about completed, and report good prospects. Pilot Co. No. 1, are about starting a new tunnel, eighty to a hundred feet lower. They will have a thousand or more feet to run through rock. The Nevada have got their diggings pumped out and are in full blast with their new engine. The Union Company washed out last week nearly two ounces from eighteen carloads of gravel from a prospect tunnel. The Nip and Tuck are working 25 hands; I was informed by the President, that \$17,000 were washed out from four and a half weeks' work at the close of the season, leaving \$12,000 profit. Mr. Taher has completed an air shaft, and is now prepared to test the gravel.

PORT WINE.—The Monte Cristo Company, at Queen City, has been running a bed-rock tunnel for eighteen months, and recently struck through into pay gravel. This claim, so far as worked, has proved the richest in northern Sierra.

SISKIYOU COUNTY.

SOOTH BAR.—*Yreka Journal*, 21st: Ryan & Co., have again struck rich prospects in their quartz lead. Having run a tunnel to the ledge, they drilled several times, and the powder failed to blast the rock. They finally prospected the dust, which they had been tamping with, and washed out \$200. They ran a side drill into the ledge, and succeeded in blasting out a quantity of rock, exposing a rich exhibit of gold, and showing that the failure of the previous efforts to blast, was occasioned by the threads of gold binding the rocks together.

TRINITY COUNTY.

ITEMS.—*Journal*, 24th: Thomas Cagle is extending his flume to Trinity river. Whitmore & Co. cleaned up last week, obtaining good pay.... The shaft being sunk by Richards and Baker is down eighty-eight feet. The gravel has been growing finer. They are now in cement. There is but little water.... Wm. Ritterbush has been running tunnels into the hill opposite Northfork and has found a hack channel that prospects well.... The big flume in Weaver creek been leveled and prepared to carry the winter freshets. The company will not put in any more boxes at the head this season. They will add thirty or forty at the tail end.... The ledge discovered by R. Silcox at Indian Valley is found to be rich.

Nevada.

COPE DISTRICT.

SMELTING WORKS.—*Elko Chronicle*, 25th: We visited the works of Gerrish & Co., above town, yesterday, and found the roasting furnace full of ore. The smelting works will be in operation, Tuesday.

ESMERALDA.

DUNDERBERG MINE.—*Enterprise*, 21st: Dr. Muuckton of the Dunderberg, will have his new 10-stamp mill running by the middle of next month. His lead is 30 feet wide with a pay streak seven feet. Some specimens he showed us are very rich in both silver and gold, and an assay made in San Francisco went \$1,622 in silver and

\$265 in gold—total, \$1,887. An assay made yesterday in Silver City of another specimen went \$2,115 18.

HUMBOLDT.

GOLD RUN.—Correspondence of *Register*, 24th: The road from the Buckley mine to the Home Ticket is just completed. This will give easy access to the above mines. L. D. Webb, is prospecting on the second extension South of Golconda. He has a ledge three feet wide with good walls and solid mineral that is equal to the best Golconda milling ore. Mr. Webb has run in on the ledge ten feet, and has taken out 30 tons of fine milling ore.

REESE RIVER.

BULLION.—*Reveille*, 19th: On Saturday the Manhattan shipped twelve bars of bullion, weighing 10,333 pounds and valued at \$16,277. On the 19th the Co. shipped four bars valued at \$2,634.

RICH.—A small lot of three-fourths of a ton of ore from the Oregon mine, just worked at the Manhattan mill, yielded silver at the rate of \$3,000 per ton.

BELMONT.—*Cor.* of same 24th: Some most interesting and splendid specimens of surface silver ores are obtained from the exposed portions of the El Dorado South lode. Only a portion of the vein matter is in the solid condition. Nearly the entire vein above water is in a state of chloridization. The lode varies from fifteen to forty feet in width. The productive portion from nine to twenty-three feet. At the depth of 240 feet in the main working shaft, at water line, a level north in the solid ledge is now in sixty feet, proving it to be over eleven feet in width. At the south workings an enormous mass of chloride ore, overrides the solid lode, which has worked at the mills \$130 to \$562 per ton. There is now on dump-pilks 1,000 tons of first and second class ore. That added daily to the present large amount proves the ore alone in sight above water line to be worth at least a quarter of a million of dollars. Already over \$130,000 has been the yield of ore from this property, at an average of \$176 per ton.

WASHOE.

OPHIR.—*Enterprise*, 26th: Rumors of a rich strike have been in circulation for two or three days.

SAYAOE.—Daily yield 60 tons. A body of ore—the same struck on the D street level of the Gould and Curry—has been developed. This is turning out splendidly. The ore mills \$36 per ton. That from the eighth station yields \$28.

SACRAMENTO AND MEREDITH.—Since last report there has been a change for the better in the ore extracted. Judging from present appearances, their next clean-up will be better than any they have yet made. They reduce 48 to 55 tons of ore per day.

OCCIDENTAL.—The Co. are taking out 60 tons per day of good milling ore, from drifts running from the winze from the lower tunnel. The mill is in constant operation and is found to work to perfection.

VIROINIA CONSOLIDATED.—The tunnel from the shaft at the 500-foot level is in 630 feet. The upper works produce eight to ten tons of good ore per day.

CALEDONIA.—Taking out 50 tons of good ore per day, which is being crushed at the Piute Mill. The rock appears to improve as it is followed down. Car assays average \$43. Some has been found in the bottom of the mine that assays over \$1,000; but this is from selected specimens.

HALE AND NORCROSS.—The Co. are taking out 230 tons per day of excellent ore. The north winze is down 60 feet below the seventh station and is in very fine ore.

IMPERIAL EMPIRE.—The daily yield is 40 tons from the upper works of the old Imperial. The main shaft has been sunk to a depth of over 1,300 feet.

OVERMAN.—The body of ore on the 226-foot level, 200 feet east of the shaft, is of fair quality and has the appearance of being extensive. The richest ore in the mine is found between the 400 and 500-foot levels.

GOULD AND CURRY.—The rich deposit of ore lately found is yielding a large quantity for milling.

SIERRA NEVADA.—They have an abundance of fair ore, and their mill is kept in constant operation. Their supply of low grade ore may be said to be inexhaustible.

SEGREGATED BELCHER.—Are taking out ten or twelve tons of fair milling ore per day from the 300-foot level. The Eureka mill has been crushing ore for them, but it is at present shut down on account of scarcity of water.

SUTRO TUNNEL.—Yesterday the tunnel was in 1,582 feet. The rock is still softer and they have made during the week thirty-eight feet.

BELCHER.—Yielding twenty tons per day. Prospecting is still vigorously prosecuted.

HOPE.—Yielding the usual amount of ore per day, milling on the average \$23 per ton. The mill is kept in constant operation.

CHOLLAR POTOSI.—Yield of ore for the week 1,600 tons. All parts of the mine are looking well.

WHITE PINE.

REVIEW.—*Nevada*, 25th: We report continued improvement in the aspect of our principal mines. In the Base Metal Range great quantities of ore are accumulating on the dumps. This is attributable mainly to the erection of the Matteson Smelting works—the successful starting of which has guaranteed ready sale for ores at fair prices.

ITEMS.—Aurora South: One hundred men are taking out sixty tons high grade ore daily.... In Original Hidden Treasure twenty-five men are at work. The mine never looked better, and an exceedingly rich pocket was struck during the week.... Silver Wedge is producing better ore than over.... Ward Beecher yields twenty-five tons per day; employing twenty-six men. The assays during the last month average \$50 to the ton.... Consolidated Chloride Flat mines have been leased and men are at work.... Burning Moscow shows good ore; twelve men at work.... Noonday takes out ore good and plenty.... Virginia is preparing for the resumption of operations, Monday.... Addington, on the western slope, has been leased to J. C. Powell, who has twenty tons of ore on dump, which will mill \$60 per ton.... Eberhardt works fifteen men in the Keystone and Blue Bell shaft; but "num" is the word.... Jennie A is taking out immense quantities of good carbonate ores.... Camperdown, on the eastern slope, is taking out fine carbonate and galena ores. The incline is down 80 feet, in ore all the way.... Blue Cloud shows good carbonates, but galena predominates. Three shafts twenty feet deep have been sunk; twenty tons fair ore on dump.... Ticonderoga has a shaft twenty feet deep, out of which forty-five tons of fine ore have been extracted.... The mines at Mount Ophir are nearly all at work. It is intended to start the Monte Christo mill with its new Stetefeldt furnace, to-morrow.... The Stanford mill will start upon ore from the South Aurora, October 1st.... The Dayton and Manhattan have been running for the last week.... The Henderson mill has started up.... The Rathburn furnace is having a new lining and will start in a few days.... Matteson furnace No. 1, turns out six tons of bullion per day; No. 3, is almost ready; No. 2, is drying.

BASE BULLION.—Jennie A, shipped yesterday, to San Francisco, 615 bars, weighing 55,350 pounds, smelted in the Rathburn furnace since Monday morning, out of 77 tons of ore.

OUTSIDE DISTRICTS.—Robinson begins to be lively. The Cummings mine employs a large force. The furnace will start again Sunday with a large supply of coal.... Nothing doing at Egan. The Gilligan mine has sent a lot of ore to Reno, to be roasted in the Stetefeldt furnace, and if successful, the company will erect a furnace and start work.

SPIRITUAL.—F. M. Clark, of Reveille District, was told by a female medium in Chicago, a year ago, that a large body of rich ore might be found by moving one foot to the north and going down 15 feet on the Santa Fe claim, which had been abandoned after sinking a hole 6 feet in solid limestone. Also, that in the Fisherman ledge, 15 feet from a certain point, rich ore would be found. Directions were followed and \$1,600 ore turned up in the first case, and \$6,000 ore in the second. This must be true, for the *Nevada* has some of the ore.

EUREKA.—*Sentinel*, 24th: Work has been commenced again on the El Dorado mine.... The new engine for the Jackson Works, is in place. The company has struck \$300-ore.

Arizona.

UNCLE BILLY.—Prescott *Miner*, 10th: V. B. Pointer closed operations on his mine on Lynx creek last week, for the season—water having failed. He states that on the last run he ground 26 tons of rock, from which he realized \$1,200 in free gold.

BRADSHAW.—The Del Pasco were getting out decomposed rock of surprising richness—\$38 had been washed out of one pan of the rotten vein matter, and from \$10 to \$20 had been frequently obtained. They were grinding the rock in arrastras.

ITEMS.—Same of 17th: Messrs. Bain, Alexander, and others, came in from the Bradshaw mines during the week. Del Pasco were down 20 feet—were drifting from the bottom, and getting as rich ore as

any yet. Pieces of rock in which no gold was visible, on being crushed and washed, yielded enormously.... Operations at the Sterling mill are suspended for lack of water. The short run is said to have been satisfactory, the yield of free gold being \$14 per ton. One mile below the site of the mill there is plenty of water in the driest season.... Chas. Otten on Sunday, brought in over a pound of gold. Otten has a good claim on the Hassayampa.

Idaho.

ITEMS.—*Avalanche*, Sept. 17th: The shaft on the Illinois Central, is down 30 feet. The average width of the ledge is 15 inches. The quartz is rich in silver, intermingled with fine gold.... The new shaft on the Red Mountain is 30 feet deep, from the bottom of which a drift has been run north 30 feet. The ledge is 16 inches, containing small rich streaks. The most valuable portion is put in sacks.... The Chipmunk shaft is down 42 feet. The ledge is increasing in width.... Pete Nick, on the Corduroy, has 35 men at work. The winze is down 65 feet, showing a vein two feet.... There are one hundred men employed about the Chariot.... Clark has 65 men at work in the Ida Elmore and New York.... The Blue Jacket shaft, is 55 ft. deep, showing a ledge two feet wide. There are 40 tons of ore on dump.... "Swallow" is a gold bearing ledge discovered this week by Sam Slick, in Vass Gulch. At a depth of five feet the vein is 20 inches in width and prospects 15 cents to the pan.... Judge Robinson and Dan Monroe are working the "Mitrailleur." The vein is only three inches in width but will yield \$300 per ton in gold.

Lower California.

SAN RAFAEL.—San Diego *Union*, 22d: We are informed that there are between 300 and 400 people in the Valley mining region. About \$1,000 worth of gold dust from these mines has been sold in San Diego during the past week.

A San Diego telegram of 27th says: Two Mexicans discovered a quartz ledge in the vicinity of San Rafael Valley, which is so rich that a small piece of ore weighing sixteen ounces contained fourteen ounces of pure gold. Numbers from all parts of the country are leaving to visit these mines.

Montana.

PILGRIM BAR.—*New North West*, 16th: The clean-ups yesterday, were Berry & Co., \$3,450; Blair & Co., \$2,000; Catching, Kohra & Co., \$1,926; Roberts, Fly & Co., \$1,300. The others were up to average. Thos. Irvine, Jr., James Pierce and H. C. Fisher have commenced opening their ground on the hill above, and yesterday made the first clean-up of over \$800.

DEER.—Only five companies—in all 20 men—are working, 10 of whom are on the Hayden, Gibbs & Co.'s claims. Water has fallen off to a 15-inch head, 2½ hours a day.

PHILIPSBURG.—Cole Saunders says the difficulty is at last overcome. Smelting is the word; and as the Trout ore does not contain sufficient galena, it will be mixed with ore from Soap Gulch. It is found to work like a charm.

SILVER STAR.—Cor. of same: Ground in Basin Gulch laid over to May 1st 1871. Thompson & Dickey's galena lode, at Soap, is yielding five tons of ore per day to two men—worth \$10 per ton to them on the ground, and 50 more to Stapleton at his furnace in Argenta. The Everett mill is crushing 15 to 18 tons per day of \$30 quartz, taken out at a depth of 150 feet, from a 500 feet tunnel on the Green Campbell. The Iron Rod is on \$100 rock. The Clipper crevice is 2 to 15 inches, but the ore yields largely. They cleaned up from their arrastra 69 ounces of retort after a nine days' run.

QUARTZ CREEK.—*Independent*, 17th: Tom. Smith & Co., at the mouth of Quartz Gulch, are making ten to twelve dollars a day to the hand. Doc. Cobert & Co. are running a drain to discovery claim. They have not yet reached bed rock, but are getting 25 to 50 cents per pan in the gravel. Mike Golden has laid 100 feet of flume, and will begin sluicing to-morrow. He has taken out as high as \$2.50 to the pan.

CABLE CITY.—Prospects are good. The ledge at the thickest part is 50 feet, all of which pays well. The shaft is 150 feet down. The next level will be ready for stopping by the 25th.

RACE TRACK DITCH.—The companies working Uncle Ben's gulch are making \$15 to \$18 per day to the man. The Prairie diggings promise well.

MOOSE CREEK MINES.—The reduction works of Day & Harvey, are in operation. They consist of a small furnace, two stamps,

a Chili mill and two arrastras. The ore averages \$150 per ton. The first class ore of which there is 100 tons on the "dump," will yield \$225 to the ton.

San Francisco Stock Market Review.

THURSDAY EVENING, SEPT. 29, 1870.

For the period under review, the mining share market exhibited considerable life, particularly in outside descriptions of stock, a more healthful disposition upon the part of dealers having manifested itself in their behalf. With reference to the immediate stock in trade of the Board—the Comstock shares—a much improved feeling prevails; and the future of these claims looks much more hopeful than it did some time past. The aggregate amount of bullion now being extracted is really surprising, under the rather apathetic condition of affairs, and the yield for the current year will be very gratifying.

The White Pine *News* of September 20th contains a very interesting tabular statement of the ore product of that region as furnished by Mr. Dayton, Deputy County Assessor, for the quarter ending June 30th, 1870, and remarks as follows: "During the three months, from April 1st to June 30th, the mills in this district reduced 8,973 tons and 1,368 pounds of ore, yielding \$368,414 71—averaging \$41 09 per ton; and further, that 1,004 tons of base metal ore were sold on the dumps for \$17,404 35, or at an average of \$17 33½ per ton—giving a total product of \$386,119 06; which certainly does not look so very bad for the resources of our district, and which is the most positive evidence that the mines on Treasures Hill and on the Base Range are not yet worked out. Looking at the yield of a few of the more prominent mines, such as the Aurora South, with 2,833 tons, average \$47 29; the Original Hidden Treasure, with 2,472 tons, average \$48 21; Burning Moscow, with 26 tons, average \$162 23; Chloride Flat, 86 tons, average \$50 63; Snow Drop, 55 tons, average \$97 24; Summit & Nevada, 758 tons, average \$31 12; Antumn No. 2, 41 tons, average \$63, etc., it will be seen that the yield of our mines is steadily increasing, and that the next quarter, with an increased force of labor employed, will make a still better showing. Certainly our mines are not producing the immensely rich chlorides as during the last year, but the present results show that we have got mines on which we can depend, and which, from present appearances, are not very likely to give out. It being a well-known fact that mines giving an average yield and quantities of ore as above quoted, are more likely and always do prove better paying for their owners than those that run away up in the hundreds and thousands and yielding but small lots of ore. Let all those who doubt the permanency of our mines give the statement a careful perusal, and we are sure they must come to the conclusion that our District is not quite played out yet, and that our prospects for better times are daily increasing. What with additional milling and smelting facilities, such as are being built at present, and on the other hand with the increased yield of our mines, our prospects certainly never looked brighter."

This table embraces the reports of eighty companies, with an aggregate of 9,977½ tons of ore, worked or sold, valued at \$386,119, which is equal to \$38 70 per ton.

HALE & NORCROSS.—has been in request, under moderate sales, showing quite an advance. For the week ending September 24th they extracted 151½ tons of ore from the 300 level, and 899½ from the seventh station level, making a total of 1,051 tons; previous week, 1,118½ tons. They have in their dumps 6,040 tons. On the 27th inst. the shaft had attained a depth of 69 feet below the seventh station level. They are continuing to sink the north winze, and the quality of ore encountered has greatly improved within a few days past. The ore-breasts north of the shaft continue to look well, and the ore-breasts south of the shaft show considerable improvement.

GOULN & CURRY.—exhibits a marked decline during the week under review, with a good line of transactions. For the week closing September 25th they extracted 16½ tons of first-class ore, valued at \$587 82 per ton, and second class 563½ tons, showing an assay value of \$53 08 per ton. With the exception of a seam of 2½ feet good ore found in the El Dorado workings, no new developments have been made.

CHOLLAR-POTOSI.—has been less active than

last week; however, it continues in favor at a good figure. They extracted 1,699 tons of ore during the week ending September 24th, valued at \$69 10 per ton; previous week they took out 1,716 tons. On the 27th, the south face of the stope in the Potosi Tunnel level had seven feet of white quartz, and assays from samples reach \$23 per ton. They are now carrying this drift forward for the purpose of thoroughly prospecting the same.

BELCHER.—is in slight request. On the 27th, the 200 level exhibited some improvement, assays showing \$25 ore. The north end of the 200 level continues to look well. They are running the drift in the pay streak, which is reported to be about four feet wide, car samples assaying \$60 to the ton.

OVERMAN.—sold moderately at previous figures. For the week ending September 25th, the 400 south raise is said to have produced the usual amount of first-class ore, and from present appearances, they expect a large increase from this point. The ore on the 226 level has nearly doubled in width during the week under review. The Lambert Tunnel is improving as they go south, assays for the week showing \$43 94 per ton. On the 24th inst. they sent forward \$7,100 in crude bullion.

SIERRA NEVADA.—continues to be well maintained. During the semi-monthly run, ending September 16th, the bullion yield amounted to \$13,089.

CROWN POINT.—is less active, and lacks firmness. For the week closing September 23d, 197½ tons were taken from the old works, valued at \$3,912, equal to \$19 80 per ton. The incline is down 53 feet below the 1,100 foot level, the material encountered being a mixture of quartz and porphyry, making it easier to advance than heretofore. The south drift from the 1,100 foot level is in from the main east drift 79 feet, the entire face of the drift showing quartz.

SAVAGE.—increased in sales under well maintained rates. During the week ending September 24th, they extracted 465 tons of ore, valued at \$12,254, equal to \$26 35 per ton. "The winze from the 8th level has reached the 9th station, and from the bottom of this winze it is the intention to run a drift north to connect with the drift running from the shaft, and will also run south to connect with the 9th level of the Hale & Norcross. The 9th station has been opened out east 90 feet from the shaft. They have resumed the work of sinking the main shaft, and in 60 days expect to make a point sufficiently low to open the 10th station. The Potosi chimney shows well, and the present prospects are good for a large body of ore. The winze on this body shows a decided improvement, the daily yield for the week being fourteen tons."

*Advertised in this Journal

FATAL TO THE TEETH are all acid preparations. They may bleach the enamel, but they as surely dissolve and destroy it. The mild, genial balsamic and preservative **SOZODONT**, impregnated with the SAPON of the famous tropical Soap Tree, of Chili, is the only absolute safe article of its kind in the market, and protects the teeth from all destructive influences, as well as keeps them free from tartar.

Tobacco in California.

The "vicious weed" seems to "grow itself" in many parts of the mild climate of California. In the spring of 1869, we were surprised at finding in one of the deep ravines, some three miles west of Gilroy, a patch of tobacco in full bloom and growing wild. It stood in thick clusters, surrounded by weeds and grass, and overgrowing the dry limbs which had fallen from the surrounding trees. These plants had sprung up on ground once cultivated along the stream, and continued their growth through the winter, without weeding, hoeing, "topping" or "sucker-ing," and that too unmolested by worms, the great pest of tobacco raising in the Eastern States. The land where these plants were growing had been cultivated with tobacco. But there are several varieties of tobacco indigenous to the State. Various mention is made of such plants in the Pacific Railroad reports.

The plant is very common in the neighborhood of Tehama, where it attains a height of from 1½ to upwards of 3 feet, with vigorous stalks and leaves, the latter however smaller than the cultivated plant. It is said that the Indians have been in the habit of gathering it for years past, and using it for smoking purposes.

As the tobacco of commerce, has been brought to its present improved state from a weed which grew wild in the now Central American State of Honduras, it is by no means impossible that some of the indigenous varieties of tobacco of California might, by careful culture, be advanced to a superior degree of perfection to any now under cultivation.

It is curious fact that tobacco is cultivated in every State and territory in the Union but Dakota. The total product of 1850 was 99,800 tons; which in 1860 had increased to the enormous amount of 217,101 tons. The yield in this State in 1850 was 9,802 tons; in 1860 it had only increased to 10,609 tons.

Its chief place of culture is on the Uvas Creek, in the San Jose Valley, where some two years since five growers, Messrs. Hanna & Brothers, M. E. McCutchen, J. D. Culp, Joseph Duncan and John Bueley cultivated an aggregate of 74 acres. A Mr. Martin, of Monterey County, grew some 40,000 lbs. per year, which is sold largely for washing sheep. Some small quantities are raised in San Diego County, and other portions of the State.

The quality of California tobacco, if properly cured, is equal to the best, although dealers are shy of it until it has been sent to New York and shipped back again, as "genuine Kentucky Leaf," "Maryland," "Virginia" or "Connecticut, when it is considered an A No. 1 article! *This thing has been done;* and more's the shame on our dealers that such things are allowed, and thus made a useless tax on our industries. Tobacco growing might be made an important interest in California. If the "filthy weed" must be used, why not employ the home article, which can be made superior to nine-tenths of that which is imported. The worm, so troublesome at the East, is but little known here; while in our climate it can be cured in the open air, thus saving a great expense entailed by the necessity of house drying at the East. Mr. Culp, above mentioned, has a large factory on his place on Uvas Creek, where many tons of genuine "Killiknick" are manufactured, and which many of our readers have doubtless "puffed" in the full belief that they were burning the genuine "old Virginia."

PRESERVING HOPS.—A new improvement in sacking, or baling hops, now in favor in Canada, is to put wide, strong sheets of paper inside the sacking. As paper is a non-conductor, and air tight, it is believed to be a preventive of the rapid escape of lupulone.

Angora or Cashmere Goats.

Among the several exhibits of Angora or Cashmere Goats at the stock grounds, of the late State Fair, we have been especially interested in that made by Messrs. Gray & Gilmore, of El Dorado, El Dorado County. They showed seven thorough bred hucks that are models of beauty, and indicate the "blood" in its purity. Our attention was called especially to one huck "Sultan" six years old, that was imported from Turkey, in 1867, to Massachusetts, and thence by Gray & Gilmore to this State.

This buck is the most perfect beauty we ever saw, and every person that has seen it will accede to this as the finest specimen on exhibition. It is claimed that this is the best Angora huck in America, if not in the world. The entire lot which these gentlemen exhibit are the progeny of this imported buck. Besides the seven thorough bred, which are remarkable for length and fineness of fleeces, they also show four graded ewes of 15-16 blood Angora. There is but little difference in their appearance; but a close examination will show more coarse hairs or *kemp* in the fleece.

The fleece of the graded goat is worth about \$1.00 per lb., while the pure breed fleece will bring about \$1.25 per lb. One graded ewe, though but four years of age, gave five lbs. of fleece.

Messrs. Gray & Gilmore have thirteen hundred head of goats, and make this business a speciality. They have about three hundred native, and seven-hundred half breeds, the rest are higher grade, to pure blood.

Crossing with the Common Goat.

Mr. N. Gilmore, one of the partners, and the gentleman with whom we conversed, claims that the advantage in crossing with the native, or Mexican goat is very great to the native goat. First, the meat is greatly improved, becoming rich and tender; there is less, in fact scarce any disagreeable scent about the Angora goat, and the rank taste that the native goat meat is liable to have disappears. It is also improved in every other respect, except perhaps in the quantity of the milk, in which no particular difference is observed. But the most remarkable improvement and the most profitable as well, is in the richness of the fleece.

For Furs and Buggy Robes.

At the first crossing, the fleece becomes glossy and wavy-like, making beautiful saddle trimmings, hair rugs, etc. At the second crossing, the fleece is not only glossy, but fine and soft as silk. The skins at this grade make the most beautiful robes for carriages. The best silver gray fox skins, worth \$40 to \$50 each, are not superior for beauty; while for wear, and for gloss, these goat skins are superior to the fox. Mr. G. had on exhibition two robes, made by his wife, which will satisfy any observer of the correctness of this statement.

When we take into consideration the important fact that our wild furs are yearly growing scarce, and correspondingly high, the advantage of thus being able to produce our own most useful furs, in this way, will be appreciated. Aside from the value of the shorn fleece, the meat as food, and the superior fur for many purposes, the skin can be tanned and used for all the finer work—as for gloves, ladies' fine shoes, etc. No stained skin can equal for fineness of texture, strength and beauty of the leather made from the skins of this goat. Messrs. Gray & Gilmore have a large flock of Angora goats and grades—and are devoting their attention to the business in a way to insure encouragement and success.

Good Business for Young Men.

A herd of common goats can be bought at about \$2.00 per head. One huck will serve from one to two hundred in a season. They will find pasture on lands throughout our State in hilly and mountainous districts, which are easy to be obtained, and of little value for cultivation. We know of no enterprise more promising to a young man with limited means than this very thing. It costs but little to make a small

beginning, and thousands of places just adapted to this sort of stock breeding may be taken up at government price, where nice homesteads may be laid out, and where the vine and fig tree, the mulberry, and many other profitable things can be planted, while the goats are feeding and increasing in numbers and value. This enterprise cannot be overdone in many years in California. There is no country under the sun where the conditions of soil and climate are more favorable to the breeding and growth and health of this animal. It is in other lands an unusual occurrence for these goats to breed twins, but Mr. Gilmore asserts that five of his goats have had twins this season. One pure blooded ewe that dropped twins on the 21st of last January, gave birth to a fine pair of twins again July 14.

Tropical Trees and Fruits in Stockton.

Three century plants have bloomed in Stockton this season, ranging in height from 25 to 30 feet. There are many more fine, vigorous ones to be seen in various parts of the city. Wherever this plant has been tried in the open air in this State it succeeds without attention.

We have also noticed several palm trees there, two very fine large fan-palms, something over a dozen years old, growing in the yard of Mr. Hewlett. They were planted by Mr. Crozier, Editor of the Santa Cruz Sentinel, and have never received shelter. The stocks are about 9 feet high, and 18 inches through, while their spreading leaves reach out several feet.

Oranges and Lemons.

At the home of Dr. Holden, we saw oranges growing on a tree seven years old, which grew from seed obtained in Panama. This is the third crop, as it commenced bearing the fourth year, and has produced about 300 oranges since that time. The Doctor has several orange and lemon trees growing without shelter in his garden. He thinks them quite as hardy in this climate as peach trees, and says he has no doubt as to the practicability of the open culture of orange and lemon orchards throughout our interior valleys.

Mr. West, nurseryman, at Stockton, whose "card" will be found in our advertising column, has a fine lot of young orange and lemon trees growing in the open nursery row, which have an unusually bright and thrifty appearance. He thinks they do better in an open exposure than in a partially sheltered one.

CHEESE FACTORY.—At the head of Sardine Valley, on the Henness Pass road, an extensive cheese factory has been established by Mason, Parsons & Kies, and they are manufacturing some of the finest cheese produced on the Coast. The gentleman who is superintending the process is from one of the best dairy farming localities in New York, and the establishment has every facility, in the way of machinery, for the successful prosecution of the business. Everything about the factory is kept in superb order. At the time of our visit they were milking one hundred cows, and turning out about twelve cheeses per day. The seasons' production amounted to about twelve tons. The cattle have full range of Sardine Valley, where the grazing is equal to any in the State, and the rich milk produces the finest cheese. The product of the establishment is shipped east and west on the railroad from Truckee, and the proprietors find ready sale for all they can make.

TRANSPORTATION OF EGGS, ETC.—The Sacramento Union says: By the Central Pacific freight train, Wednesday evening, there arrived from the Eastone of the Davis Refrigerator Company's cars, bringing 8,000 dozen eggs, and a quantity of Crawford peaches, Concord grapes, from St. Joseph, Michigan. The car has been on the way since Sept. 9th, yet the fruit, which we have been furnished with samples was brought through in as perfect a condition as when shipped, owing to the plan adopted, by which an even temperature of thirty four degrees is maintained in the cars continually. It is designed to take back on the return trip a load of California grapes, which the owner of the car feels confident they can place in the Eastern market in a condition that will admit of their being displayed in their native excellence.

A Simple Ladder and Stand for the Orchard.

The annexed engraving represents a cheap and simple ladder which is recommended by the *Hearth and Home* for use in the orchard. Any boy can make one. Take any young hard wood sapling, from 4 to 5 inches in diameter, according to the length desired; split it at the butt as shown; put a wooden wedge in the cleft to keep it open, and a strong band just above to keep it from splitting farther up. It may then be bored and the rungs inserted as shown. It will be found much easier and safer to rest the upper end in the crotch of a branch or limb, than to rest in the same or almost any other place, convenient of access, a ladder of the ordinary construction. It will also be found less liable to injure the tree.

Such a ladder is of course best adapted to an old orchard where the trees are tall and the limbs large. In a young orchard the best convenience for picking will be a 6 or 8 ft. a four legged stand, with the legs well distended and properly braced, two of which should have slats either as a single or double legged ladder. The steps may be employed for picking from the lower limbs, while the basket rests on the table or platform; while the higher limbs may be reached by standing upon the top. Such an arrangement will be found much better and far more safe than an ordinary step ladder, and may be made quite as light.

LARGE HOP YIELD FROM ONE YEAR CUTTINGS.—Mr. Ralph Hamlin, of Alameda county, informs us that he has raised from 2½ acres of hop cuttings, planted last February, 4,600 lbs. of hops of excellent quality. This is about equal to the yield of old vines. He says that he does not train his vines upon poles of any kind, but lets them trail upon the ground like melon vines. He thinks they do better on the ground than when climbing upon poles. His land is heavy alluvial. He cultivates until the vines occupy the ground, then lets them go until picking time.

THE APPLE CROP, throughout the Union, this year, is unusually good, and will probably exceed that of any year which has ever preceded it.

Reading for the Hour.

The Strasbourg Cathedral Clock and Library.

One of the most lamentable results of the siege of Strasbourg, leaving out of view the loss of human life, is the injury which the bombardment has inflicted upon the noble cathedral and its wonderful astronomical clock. The vast cathedral, which, perhaps more than any other one thing, has made the name of Strasbourg celebrated, is one of the finest Gothic buildings in Europe. It was founded A.D. 504. The choir was built by Charlemagne; probably about A.D. 809, though it was not completed until 1439. The material of which the cathedral is built is a brown stone, very much resembling our Connecticut Portland freestone, so extensively used in Fifth Avenue. It was obtained from a quarry at Wassenhonne, in the valley of Couronne, a few miles from Strasbourg. The architect of the existing edifice was Erwin von Steinbach, of Baden. One John Huells, of Cologne, was the architect of the peerless tower. Its spire is the loftiest in the world. Its height 466 feet, surpasses St. Peter's, and is about equal to that of the Great Pyramid. The greater part of the entire structure was destroyed by lightning in 1007, and the restored edifice was begun in 1015, and completed in 1439. The cathedral is in every part nicely decorated with sculptures; and the western front, rising to a height of 230 feet, is or was, particularly fine with its wealth of statues, ornamental carvings and bas-reliefs. It has a circular window 48 feet in diameter. The Prussian heavy artillery has made, it is said, a ruin of part of the vast building.

The astronomical clock, the product of a German clockmaker, in about the year 1550 is a marvel of ingenuity and mechanical skill, and has no counterpart. It performs not only the ordinary service of a clock, but exhibits the days, and the months, and the years; the process of the seasons; the signs of the zodiac, and the names and movements of the heavenly bodies. At each quarter-hour an angel comes out and strikes on a bell; at every hour another angel comes and strikes twice; and at 12, meridian, a figure of Christ appears, accompanied by the twelve apostles, all of whom move around a central point and pass in out of sight by another door, the stroke of twelve being given, and a cock flaps his wings and crows. The clock is enormous in size, like everything else connected with the vast cathedral, and is invisible from the outside street—the spectator passing through the nave of the cathedral to see it. It has suffered from fire and violence before the present year, having been out of repair and motionless since the revolution of 1793, until the year 1842, when it was repaired by a watchmaker of Bas-Rhin, and has been in operation since. It is to be hoped that this ingenious piece of mechanism has not been irreparably injured by the present bombardment.

The loss of the Strasbourg library—a vast collection of 800,000 volumes, including many curious monkish parchments—is total and irreparable. It can never be replaced by any collection hereafter made. It was the slow result of a thousand years; and its destruction by fire, caused by the Prussian hot shot, is like the burning of the Alexandrian library in this, that of a great number of the works destroyed no duplicates can ever be obtained.—*Hartford Times.*

Sponges.

The common washing sponge is still considered by many as of vegetable growth. Still it appears to be definitely established that it belongs to those low forms of animalcules that are comprised under the term zoophytes. However, the sponge which you use daily in your ablutions is not the animal as it lives and thrives, but only its horny substance, its skeleton. When cut loose from the submarine rocks on which it is found at considerable depth, the sponge presents itself as a black, jelly-like mass, which, when left in the air for only a few days, will give off a most disagreeable smell, originating from the gelatinous part in question. In the natural sponge you have before you a regular colony of animalcules. The elastic, horn-like net-work is then impregnated to its innermost parts with a slimy substance that is penetrated throughout by fine capillary tubes, not visible to the naked eye. In order to prepare it for use, it is first left in the air for a short time, until the gelatinous part is decomposed, then the mass is washed in hot water, and afterward in a bath of dilute

muric acid. The toilet sponges are bleached by means of chlorine and hyposulphite of soda. The so-called wax sponges that are used by doctors for dressing ulcers are purified sponges dipped into fluid wax, and then pressed between hot plates. The French and Austrian governments have commenced to rear sponges artificially—the former on the shores of the Mediterranean, the latter on the coast of Dalmatia.—*Ec.*

A State Dinner in China.

The next day we received invitations to dine with the magistrate of the city. As we traversed the court at the appointed time, our ears were greeted with a sound of suppressed chattering, and we could see that all the chinks of the surrounding windows were occupied by the ladies of the household. Our host led us into a room where the table was spread. In accordance with Chinese etiquette, he spent some time in persuading each of the guests to take the head of the table, a distinction which each one was bound by the laws of politeness to decline. The host then, standing at that place himself, insisted upon each and all sitting down before him, which was persistently declined, as it would have been a breach of politeness for a guest to take his seat first. The dinner began with a cup of hot rice wine. The table was loaded with dishes, which were placed one upon another in tiers, forming a pyramid of Chinese delicacies. There were soups made of birds' nests, of the heliotis, and of sharks' fins; there was beche-de-mer; there were stews and patés; there were roots of the water-lily; but it would take too long to enumerate all the dishes spread out before us, of each of which one was expected to taste. Great as is the variety of articles of food in the Chinese cuisine, some things which in other countries are considered most essential, are missed by the traveler, and of these none more than butter, bread and milk. There is a kind of bread which is cooked by steam, and there are flour-cakes fried in oil; they are poor substitutes. A little milk is sold, and women's milk is peddled round the cities, mostly for the use of invalids. There is an old story on the coast that, at a dinner given by a foreigner, the host took a servant to task for serving no milk for the coffee.

"Boy go catchee milk," said the gentleman. The servant disappearing, soon returned with the answer: "No have got."

"What for no have got?"

"That sow have got too muchee piecee chilo; that woman have die," replied the boy. By this the servant informed the gentleman and his guests that they had been sved from drinking the milk of either a sow or a woman only by the death of the latter and by birth of a litter to the former.

The only unpleasant feature about our dinner was the custom of every one helping everybody else, so that I could eat nothing which had not made the acquaintance with my neighbor's chop-sticks. The intervals between the courses were occupied in eating the kernels of pumpkin seeds, which are so much used in China that they form an important item in the trade of certain provinces. On peeling these seeds, if in no other way, the long nails of a Chinese exquisite certainly do good service.—*Raphael Pumpelly.*

What Flowers Teach.

Flowers teach us the tenderness of God's character. If he had made nothing of this kind, if his works had been for bare utility and had coarse and more substantial creations only, the tender side of the Divine character would have failed of the revelation it now has in nature. You cannot come across a delicate, trembling flower in the shade of a wood, so small that your heel could crush out its life with one careless step, but that you will think how gentle God must be, who made this flower in its exquisite beauty to live there, and daily cares for it in the regular course of His providence.

Following the same idea, the sleep of the flowers touches our sympathies. Many of these at night will fold their petals closely together, and like the darlings of a kind mother, repose trustfully in the care of their Creator. And during the long, dark night, they gather the dews which distill in the quiet air, and when day comes, the first beams of the morning fall on millions of glittering drops, and flash back from leaf, and bud and petal, and grassy blade, in such brilliance, that the whole waving and nodding field of blooming beauty seems dressed in gems more resplendent than any dream of oriental magnificence.—*Selected.*

Keeping Grapes Underground.

We have noticed from time to time, in our Eastern Exchanges, for the last two years, several paragraphs recording the successful preservation of grapes into and through the winter, by burying them in the ground. Some have employed stoneware jars, some boxes and others kegs; but all apparently with good and about the same success. We have not heard of its being tried anywhere except in the Eastern and Middle States; where the exposed ground is frozen most of the winter. We see no reason, however why it may not succeed in California, if the locality can be thoroughly drained. A correspondent of the *German-town Telegraph* gives the following directions:

In the fall, when they are perfectly ripe, they are taken from the vines, when they are free from any thing like moisture, handled carefully and packed in small kegs—nail kegs were the kind used in this instance. Put a layer of green leaves, right off the vines, in the bottom, on this a layer of grapes, then leaves again, and grapes alternately until the keg is full, then finish off with leaves. Put in the head, and your cask is ready for what? Why, to be buried in the ground. Dig a trench so as to admit the casks deep enough that they will have about a foot or fifteen inches of soil over them when covered. The ground should be packed moderately tight, and a board laid along on the top before the ground is thrown in. They throw some litter on the face of the ground over those they wish to take up during the winter, to prevent the ground from freezing so hard as to keep them from getting at them.

One important thing must be observed, that they be placed where there can be no standing water about the casks, or they would suffer.

On further inquiry I learned that the farmers in that neighborhood have practiced this mode for years, and don't seem to think it any thing new.

We would express the opinion that if the grapes are buried, the keg or whatever they may be packed in should be water-tight. If moisture penetrates, the grapes will not keep.

The following statement was made some time since at the "Cincinnati Horticultural Society," by J. J. Boring, Jr.:

"My mode of preserving grapes is as follows: Select, on a good dry day, none but fully ripe and good bunches; put them in low, two or three gallon stone jars, (called square jars here, as they are as wide as they are long,) and put them in a trench, so that the top of the jar is eight or twelve inches below the surface of the ground; put a piece of board (not pine) over each jar, or over every two jars, and fill up the trench with the ground extracted. If covered with straw or coarse litter, the jars can be unhurried with less trouble in cold weather.

"The last of May I have had grapes equally as fresh and sound as in October, and this year I expect to have some later yet. By way of experiment, I have kept some this winter in low boxes, and found them to keep just as well; but when kept in boxes it will, of course, be necessary that the top consist only of one board, else water will soak through, and that the ground never gets full of water. A gravelly bottom may do best. Boxes buried in cellars or out-houses, will answer fully as well as stone jars. Grapes that were gathered soon after the long wet spell of weather, about the latter part of September, and the beginning of October, of last year, did not do well, as they were too watery or juicy, and the skin too soft.

The matter was referred to a committee from whose report we make the following extract:

"In commenting on the foregoing satisfactory and lucid description of the mode adopted by Mr. Boring, your committee would suggest that the peculiarly favorable character of the soil about Lancaster, may have had considerable influence in proving the success of the experiment. The soil in that region is of a dry, porous, sandy character, very different from the soil in the neighborhood of Cincinnati, which is generally close, compact clay, very retentive of moisture.

"The committee merely allude to the difference in soils as a hint of caution to our fellow members not to experiment on too large a scale, until satisfied of its efficacy by preliminary trials.

"As your committee remarked on reporting on the condition of the fruit tested by

them, 'the simplicity of the mode recommended itself for general adoption'; still the difference of circumstances may reasonably account for variable degrees of success or failure.

BEAUTY AND TOIL.—We have seen the lip of a proud beauty curl at the name of "mechanic," when the finery that bedecked her form was the creation of his handy-work. We have seen the man who revelled in wealth gained by years of labor by his father in a mechanical employment, turn with a feeling of scorn from the men whose palm was hardened by useful toil. We have heard the politician descend upon his rights, as if it were a favor to grant them; and we have listened to many who investing themselves with a borrowed plumage, have with an approbious and anti-republican feeling, ventured to lower him in the scale of his fellow men. To such fools of an hour we have but one word to answer—it is this. You do not know the minds you would slight; they were the first to raise the cry of alarm against British oppression; they would be the first now, and none have with more confidence of sincerity, submitted to the laws enacted by their country.

COMPLIMENTARY TO WOMAN.—Recently forty-five young men and twenty-six young women, in Switzerland, pursued in common a course of study and practice, for three weeks, in the art of telegraphy, at the end of which period they presented themselves for examination, with the following result, 100 at all complimentary to the male gender.

Pronounced to be of the 1st class,	Men.	Women.
" " " " " 2d "	2	4
" " " " " 3d "	12	12
Those who did not pass,	24	9
	8	1

A FEW MINUTES' WORK.—It is not generally known that many of the myriads of pestiferous flies which haunt our houses and fields, torturing man and beast, may be prevented from breeding by giving a little labor to the drains and privies. The eggs of many of the flies are deposited in human excrement, and if dry soil and lime be thrown occasionally down the vents, the offensive smell will be overcome and the insects will have to seek other breeding places. Again if the drains are covered and the water suffered to fall into a closed cesspool, another breeding place is destroyed. A little labor will diminish these plagues wonderfully.

LITTLE BROTHERS.—Sisters, do not turn off your younger brothers as if they were slays in your way and any service which they might ask of you were a burden. Perhaps the hour may come when over a coffin that looks strangely longer than you thought, and over a pale brow where often half unwittingly and perhaps with a petulant push, you perted the hair—you bend with blinding tears and sobs that shake your very soul, while remorseful memory is busy with the by-gone hours. You will wish then that when he came and asked you to help him in his play, or to lift him on your lap because he was tired, or take him out because he wanted to see, you had laid aside your book and made the little heart glad.

GALVANIC DEPOSITION OF NICKEL.—H. Bouillet, says, in *Comptes Rendus*, that the assertion of M. Adams, in reference to the necessity of having the nickel solution absolutely free from alkalies and alkaline earths, is quite incorrect; and, in proof thereof, exhibits a perfectly coherent piece of nickel, obtained by Professor Jacobi, of St. Petersburg, from the double sulphate of nickel and magnesia, by the use of a nickel anode, which, curiously enough, is not entirely dissolved, but converted into a spongy suboxide of nickel.

The production of iron ore from the Lake Superior mines this season is estimated at a million tons, which will probably yield 600,000 tons of metallic iron, or twice the entire product of the United States in 1843.

The human body, according to Dr. Nichols, in the *Journal of Chemistry*, contains phosphorus enough for four hundred ordinary two-cent packages of matches, but not quite sulphur enough for them. There is water enough to "drown the individual," or, rather, another individual.

AURORA.—There was a brilliant display of Northern Lights last Saturday evening, which was observed also all over the State and in Nevada unusually fine.

FALL RIVER is now the City of Spindles, having 552,237, while Lowell has but 515,066.

Mining Edition and Agricultural Edition.

This week we commence issuing two editions of the PRESS which will differ only in the matter contained in the two central pages—i.e., in one edition they will contain matter expressly for miners, and in the other especially for farmers. The reading and advertising matter in the other 14 pages will be precisely alike in both editions.

We have divided our mail list so as to send each edition to those we believe it to be preferable to, but as we could not be expected to know the preference of all our subscribers in this matter, we request those who do not get the edition they most desire to inform us at once by mail and we will take pains to have their names changed from one list to the other.

This new enterprise is undertaken with a desire to furnish more reading matter for each of the interests represented, and to make the PRESS still more popular with its ever widening circle of intelligent readers. It will be continued only in event of its success in that direction.

The Craig Nozzle.

Our Hydraulic mines still contain vast amounts of untouched treasure. Those who have read the columns of our mining summary will have seen how, this year, new discoveries have been constantly made, showing that the old workings have yielded up but a portion of their precious metal. As our methods are continually being improved, we are constantly obtaining better and better results, and the future prospects of our mining interests seem all the more promising.

The nozzle which we illustrate to-day is one which has been in use for some time, and is known undoubtedly to the majority of our readers. We can, perhaps, do no better than to insert here the description

furnished us by our correspondent, L. P. Mc., who has been traveling extensively through the mining counties and has seen the device at work. He writes as follows:

"The Messrs. Craig have been engaged for the past three years in perfecting this invention, and their efforts have resulted in the production of an apparatus for hydraulic mining that, after thorough trial in over a hundred of the most extensive and prominent mines in the State, has received the highest recommendations of experienced miners. The invention consists of a hollow globe or reservoir, in which fits a ball or socket which is provided with an elbow, the globe being cut open on top. The ball revolves entirely round horizontally, and up or down at an angle of about 40 degrees. This play has been found amply sufficient for all ordinary mining purposes and the water, being fed to the discharge pipe from the globe or reservoir, has not the bad effect caused by a short turn in the pipe, like that produced by a common elbow, but causes a perfect stream to emerge at any point to which the nozzle may be directed. As a matter of economy, it not only places the water of 7 or 8 ordinary hose pipes under the control of one man, but its durability is so great (one lasting a life time) that its extra first cost is seldom noticed, it being in convenience alone worth more to the miner than the difference of cost of canvas hose. No canvas being used, it is not liable to breakage under heavy pressure, and saves the annual outlay for canvas, while the concentration of a larger body of water in one column has been found to nearly treble the amount of execution in comparison with ordinary expenses. The Globe Nozzle and its improvements are covered by three different patents, owned by Messrs. Craig, who now have two suits pending in the U. S. Circuit Court against manufacturers and users of alleged infringements thereon."

We still need more of such improvements as these to develop our mineral resources, and the inventors of such ought to be encouraged. The economy effected by a device of the kind enables us to enrich ourselves individually and the State at large. The Craig nozzle is manufactured at the Marysville Foundry by Messrs. Prescott & Schiedell, and these gentlemen or the proprietors, Messrs. R. R. and J. Craig, Nevada City, may be addressed for further particulars.

TAKING FOREIGN MINERS.—We see it stated that the constitutionality of the act of the Legislature of California, authorizing the collection of foreign miners' taxes, will be tested in the Federal courts of the city. An act of Congress forbids the collection of such taxes and makes this a penal offence. The matter ought to be settled.

Our Home Industries.

The New Stockton Woolen Mill.

A woolen mill in Stockton has become a reality, and is now running. Last February Messrs. Lambert, Doughty & Tattersson, of Stockton, entered into co-partnership, for the purpose of building a woolen factory, and ordered from the noted woolen machine works of Davis & Furber, of North Andover, Mass., the necessary machinery for the purpose—that is, they ordered from Massachusetts what they could not obtain in California, for these gentlemen, making it a rule to patronize home manufactures, had all the driving machinery and gearing made in this State, even though it cost more.

The engine is a 40-horse power, made at the Vulcan Iron works in this city, and works like a model. The boiler was made at the Globe works, Stockton, and is also excellently constructed, being especially adapted to the fuel to be employed—an important consideration. As soon as they ordered their machinery, they proceeded at once to erect the building. This is upon the south bank of Mormon Slough, which is navigable to the building, where it is 18 feet deep at high tide. The tide rises there about three feet.

The building is 93 by 50 feet, a plain but substantial wooden structure, of 1½ stories. It is quite evident to an observer that the strictest economy has been regarded as to material and labor. The company have made the building no larger than to accommodate the one set of machinery which they now have, preferring to enlarge as business may increase in the future.

The one set of machinery includes one picker, three cards, first breaker, second breaker and finisher; two jacks of 400 spindles; four looms, one dresser, one jig, one fulling mill, etc. All of which, excepting the spinning jacks, are on the first floor.

The machinery arrived on Monday, the 19th, having been shipped around Cape Horn. Everything was prepared for setting it up on its arrival, and on Thursday, the 22d, (the 4th day after the machinery arrived) they commenced carding! On Friday spinning was commenced, and dressing on Saturday!

This we call quick work, and that which looks like business. Mr. James Tattersson, one-third owner, and Supt. is a working man, and has had 25 years experience in woolen mills. He was engaged in the starting of the woolen mills at Merced, and the Marysville woolen mill, in this State. He sets up the machinery with his own hands, which are hardened with toil. He informed us that the total expense of buildings, machinery, etc., will not exceed \$27,000. He takes pride in this enterprise and asserts that if economy will win success, he is bound to succeed. We are ready to add, that if energy deserves success, that he is at least deserving.

Through impractical extravagance, an enterprise may degenerate into a miserable speculation, which will end in disreputable failure. Such has been too often the case in California. Many industrial schemes have been too prodigal in anticipation of success, too reckless of expenditures in the start or inception, and have failed where practical industry and economy might have succeeded.

The sort of goods which the company will manufacture at present will be mostly blankets. The long wools, such as the Cotswold sheep produce, is the best for such goods; little of it, however, can be procured at present. But our common bred wools work up very fair.

We commend the courage and spirit of men who have faith in things to be, to go into an enterprise of this sort, when a general depression affects everything.

The woolen mill at Sacramento has been idle for some months; but not because there is no wool in the country, and no clothing worn. Why, we are not informed, but presume that it doesn't pay. This Sacramento mill, cost in the neighborhood of \$100,000; idle capital of course, when the mill is not running. If labor was dear we might attribute it to that cause; but cannot admit it now. Whatever the cause—the fact remains the same.

Work at the Union Foundry.

In our late mention of the work going on at the foundries in this city, we omitted the Union Works, not because nothing was going on, but because, if anything, too much was being done. The following items will show how brisk business has been at these works.

A large amount of work is just being completed for the Eberhardt and Aurora Consolidated Mining Company (Limited) of London. A sixty-stamp mill has been built with 22 pans, 11 settlers, 3 agitators, 4 retorts, 1 rock breaker, a drying floor 50 feet long, a machine shop with a complete assortment of tools, everything, in short, to make a complete mill. There is a donkey pump, and 4 boilers, 56 x 16. Two Scott and Eckart cut-off engines have been built, 18x42 and 20x42 inches, which are most beautiful specimens of workmanship. Not only are they solidly and finely built, but they are also very tastily and appropriately decorated. On the governor of one will be placed the American eagle and shield, on that of the other the English lion and shield. On the sides will be fixed the arms of England and of the United States, and on the ends a device combining the two. The bed-plates will have figured on them the flags, crossed, of the two nations. They are most complete in all respects. The water for the boilers will be furnished by a feed-pump constructed with all the modern improvements especially for these engines, which will be supplied, moreover, with Armstrong and Starr patent heater and filterer.

The amalgamating department of the mill is so arranged as to save all handling, everything working automatically as far as possible. Thus, the quicksilver will be strained into a car which is elevated by machinery, so that no manual labor is required or allowed for handling the metal. The whole mill will be a model one of the very first class.

For the Meadow Valley mill, 10 additional stamps, with four pans, two settlers, four Payne and Stevens' concentrators and two retorts have been made, and a large lot of machinery to make a fine 30-stamp mill. For Mill City, Nevada, a five-stamp mill complete has been built. A similar sized mill has been made for San Diego, and large additions for the Stanford mill, at White Pine, are being constructed.

Four Statefeldt furnaces are under way, that is, the castings for four such furnaces. With each one goes a 10-stamp mill complete, of the best make. These are intended for Belmont, for Monte Christo, near White Pine, for Mineral Hill, (all these in Nevada) and for Mr. Kraft of Mexico.

A very large horizontal engine, the largest yet made here, is being built for Messrs. Kepp and Bargion of Stockton, for use in the Oakland Cotton Mills. The cylinder is 24x48, and the bed-plate, cast in one piece, weighs 14,000 lbs. A set of engines and boilers are being constructed for a marble manufactory, boilers 56 in. by 16 feet, and engine 15x42. Likewise a complete set of boilers for the Mariposa Mill at Wnshoe. Also a large amount of Excelsior pumps.

For the Petaluma and Santa Rosa Railroad, 20 cars are being built, and the foundry is putting up work to suit 400 wheels and axles for the same road. Col. Donahue has ordered two locomotives with cylinders 14x22 inches and five-foot drivers.

These items do not include all which is being done, but still make a pretty large show for the foundry business. In addition, the Union Works have a large amount of custom and miscellaneous jobs in hand, and that they have turned out a great deal of work is shown by the fact that they have been keeping 360 men employed for a considerable time.

The Shoshone Falls.

The Snake or, as it used to be called, the Lewis River is in many respects a peculiar stream. Rising in the Rocky Mountains, it traverses Southern Idaho, turns then towards the north and forms the boundary line of Idaho and Oregon for a considerable distance, and finally sweeps round in a semi-circle in Washington Territory to mingle its waters with those of the Columbia. In its course it bends and doubles in a most tortuous manner, flowing with a generally rapid current through mountainous regions, dry and sterile sago deserts with here and there grassy oases, rushing through rocky chasms and bounding over numberless falls and rapids. In a part of its way it affords opportunities for mining operations, elsewhere in spots supplying the

The banks, composed of regular strata of basalt and sandstone, are often divided into symmetrical blocks, like gigantic masonry. Tall columns with projecting tops jut out into the river, some straight, some tottering to a fall, while the remains of others lie in broken heaps below. Huge gaps yawn in the rocky walls. Above, the stream tumbles over a series of cascades, from thirty to fifty feet in height, rushing between a number of islands, and then uniting its waters for one grand leap in an unbroken mass down two hundred and ten feet into the seething, boiling, roaring chasm below, whence rise white clouds of mist, hiding the lower part of the cataract from view, and giving rise, in the sunshine, to two rainbows spanning the abyss. Then, in a calm swift current, the waters rush in to other scenes.

Notes on Contributions to our Cabinet.*

We have to-day to speak of specimens sent us from Mineral Hill, Nevada. Our readers will find, on page 90 of this volume, a detailed description of this locality, of the formation, mines, etc., by our correspondent, W. H. M., who speaks most highly of the district. The specimens we have received vary considerably in appearance, although a large number are similar. There are some very fine pieces in the lot.

No. 491.—This includes a number of specimens from the Mary Ann Mine, owned by the Mineral Hill M. Co. They consist of a quartzose gangue impregnated with varying quantities of lead minerals. Galena occurs sparingly and there is but very little copper. But the principal minerals, which constitute almost wholly one or two

Austin mine, is of entirely different appearance. This consists of some anglesite and galena, finely impregnated in the gangue, which is colored green and blue with copper carbonate stains.

No. 500.—A specimen from the May Day Queen, consisting of a rounded mass of coarsely crystalline galena, which is oxidized on the surface.

No. 501.—From the Western Slope, owned by Spencer & Co. This is of entirely different appearance again. There is apparently a large amount of Stetefeldite, in which come small crystals of galena. There are blue and green stains from copper, and in the cavities are small hot-ryoidal masses of chrysocolla, or silicate of copper. We should be glad to get more specimens like this.

No. 502 and 503.—These come from an

THE GREAT SHOSHONE FALLS ON THE SNAKE RIVER, IDAHO.

needs of the farmer, and presenting many grand scenes for the lover of scenery and phases of interest to the mineralogist and geologist.

Some fifty miles above the crossing of the Kelton and Idaho road at the Overland Ferry the river enters the Big Cañon, a rocky cleft, about a quarter of a mile wide, with perpendicular walls ranging from a hundred to a thousand feet in height, formed in a section of country overflowed in large portions by broad fields of dark basaltic rock. In these volcanic wastes huge gaps and fissures of great depth abound, and dikes or mounds testify to former convulsions of nature. Traveling over these plains, one comes to these huge rents without being aware of them until in close proximity. This formation detracts from the grandeur of the scenes, and causes the roar of falling torrents to be inaudible at any considerable distance, except under particularly favorable circumstances.

Twenty-three miles below Fort Hall, in a monotonous plain, the river plunges down in one unbroken sheet a distance of sixty-five feet, at the American Falls. Sixty miles below this, at the Little Shoshone Falls, the leap is for a distance of one hundred feet; and three miles farther down, in the wildest and deepest part of the Big Cañon, where the river banks rise perpendicularly a thousand feet, are the Great Shoshone Falls,—the subject of our illustration.

Concerning the other remarkable occurrences along this stream,—the cathedral rocks, the natural bridges, buttes, etc., etc., an interesting volume might be written. But we have no place for that volume here. The view of the Falls which we present to our readers, we have had engraved from a photograph sent us by our traveling agent, Mr. W. H. Murray, who apparently, amid his business occupations, has always an eye to the picturesque and sublime.

PROSPECTING EXPEDITION.—An excursion party has just left New York for Colorado. Among the number are several capitalists, and their avowed object is to visit the mines around Georgetown with a view to investments. A good idea.

THE MASONIC MIRROR.—This valuable exchange, the organ of the Craft on this coast, comes everfilled with matter of paramount interest to the Fraternity and pleasant for family reading. We read it with interest, can heartily recommend it, and would like to see its scope of influence, already large, further extended. It does good work and deserves hearty support.

TELEGRAPHIC.—In the afternoon of the 27th. the lines of the Western Union Telegraph company were completed to Santa Barbara and San Buenaventura and opened for business.

pieces, are gray, lamellar sulphate of lead (anglesite) and yellow molybdate of lead (wulfenite).

No. 492.—Two specimens from the Silver Queen, owned by the same company. One is considerably decomposed and evidently came from on or near the surface. The other resembles the ore from the Mary Ann, but has considerable quartz and some copper stains.

No. 493.—From the Giant Shaft of the same company. Holds considerable of the sulphate and the molybdate, with but very little of the sulphuret (galena).

No. 494.—This came from the Star of the West, and differs considerably from the preceding; for it contains but little, if any, sulphate of lead, while there is apparently some Stetefeldite; considerable discoloration from iron and copper, and one or two small pieces of native silver, the latter being discovered only after a careful search.

No. 495.—From the Great Republic, is rich in white and gray anglesite which is the principal mineral contained.

No. 496.—From the Troy South, owned by Spencer & Co., is similar to the first specimens mentioned, but there are more green copper stains.

No. 497.—This, from the Austin ledge, owned by Plummer, McCabe & Co., resembles the last. The same may be said of No. 498, from the Spencer ledge, owned by Spencer & Co. But No. 499, from the

entirely different locality—the mines at Little Cottonwood, Utah. The first is a piece of nearly solid galena with a very little zincblende. The second is quite a curiosity, being one of the first bars of lead smelted in the territory. It was presented to us by Mr. S. D. Woodhull, one of the brothers who erected the first lead smelting works in Utah. The lead is apparently of very good quality. The galena assays, we are told, about 71 per cent. of lead and 77 ounces silver. This specimen is from the Chicago ledge.

*Under this heading we shall continue to mention and describe, according to merit, such specimens of ores, minerals, fossils, curiosities, etc., as may be sent to us by mail or express prepaid. Each article will be numbered, marked with the name of the donor and the locality, and placed in our cabinet. A full account of the place, occurrence, etc., when sent adds much to the value of such specimens.

TILTING STAND FOR ICE-PITCHERS.—The address of the patentee of this invention, illustrated last week, is John Gibson, Jr., 791 (instead of 711) Broadway, Albany, N. Y.

COMPLETED.—The Blue Point Grand Mining Company's bed-rock tunnel was completed in the evening of the 15th inst., after 3½ years work. It is 2,270 feet long. The occasion was celebrated by appropriate festivities at Sucker Flat.

THE OREGON LEGISLATURE met on the 13th, and elected Grover Governor over Palmer.

LEA & PERRINS'
CELEBRATED
Worcestershire Sauce.

Declared by Connoisseurs to be the only good Sauce. The success of this most delicious and unrivalled Condiment having caused certain dealers to apply the name "Worcestershire Sauce" to their own inferior compound, the public is hereby informed that the only way to secure the genuine is to ask for LEA & PERRINS' Sauce, and see that their name are upon the wrapper, labels, stopper and bottle.

Some of the foreign markets having been supplied with a spurious Worcestershire Sauce, upon the wrapper and labels of which the names of Lea and Perrins have been forged, L. and P. give notice that they have furnished their correspondents with power of attorney to take instant proceedings against manufacturers and vendors of such, or any other imitations by which their right may be infringed.

Ask for LEA & PERRINS' Sauce and see name on wrapper, label, bottle and stopper.

SCIENTIFIC PRESS.—This paper comes to us this week with a full double sheet extra. It contains a full map of California, a map of the San Joaquin valley, with a brief description and statement of the productions of each county, besides the usual mining, agricultural and scientific intelligence. It is a paper that should be in the hands of every farmer, miner and manufacturer on this coast.—*San Francisco.*

WIESTER & CO.,
PATENT BROKERS,
No. 314 Bush Street, San Francisco.
PATENTS BOUGHT AND SOLD ON COMMISSION.
Westfall's Improved Potato Digger.

We ask special attention to this practical and useful invention. Nearly every farmer has felt the want of a machine to dig potatoes. This new invention fully supplies that want. The machine being made entirely of iron and steel will last longer than the farce who buys it. It is operated by a man and one or two horses and digs one row at a time. The shovel part of the digger enters under the potatoes and raises them on to the fingers in the rear, where the dirt falls through and the potatoes roll back on to the surface of the ground. The machine is prevented from clogging by a reel which revolves above the fingers and carries through the potato vines, weeds, etc. A complete model can be seen at our office. Full particulars in regard to Machines or Rights furnished on application.

New Gas Light.
This Light takes the place of the Candle, the Kerosene Lamp and Coal Gas. Each Lamp is a perfect Gas Factory, making its own gas as fast as it is required. It is a safe, cheap and beautiful light. Circulars and full particulars sent on application.
A few good traveling agents wanted to sell this and other valuable Patents.

Hold Your Horses!
By the use of "Burns Patent Safety Bridle" the wildest horse can be controlled with ease. The mildest bit is used and the horse's mouth cannot be injured. No restive horse should be driven with any other bridle. Send for descriptive circulars, or call and see the Bridle. Shop Rights for Sale.

Hunter's Improved Grain Separator.
The best machine to Clean Grain in the world. Prices reduced. Send for descriptive circular and price list. County Rights for sale.

For Sale.
We have for sale the right to the Pacific Coast for the safest, cheapest, most compact and simple Engine and Hoisting Machinery for mining and other purposes ever invented. Although new it has been thoroughly tested and we have strong testimonials in its favor from many of the most substantial men of the East. We invite manufacturers and others, to call at our office and make their own investigations.

PATENT GARDEN SPRINKLER
AND PORTABLE FOUNT.

This is the best Garden Sprinkler in use for large plots. It sprays over a large space evenly and falls upon the ground like rain, and will not hurt the most delicate plant or flower. It is portable and easily moved from place to place, thereby making them a luxurious treat in a warm climate, by setting one down on the windward side of you at your repast and rest. Every Farmer in this warm climate should have one, that has pressure of water from tanks or otherwise. They are substantially made and not liable to get out of order, and cheap—the price being five dollars each. The above cut will convey the idea at once of their superstructure. Their weight being about five pounds, they can be used like a hose-pipe, in hand when wanted.

I also have Cast Iron Stocks, or Hydrants; price, \$3.50 each. PUMPS, assorted kinds, and

MANUFACTURER OF

The California Powder Works

No. 314 CALIFORNIA STREET,
SAN FRANCISCO.

Manufacturers and have constantly on hand
SPORTING,
MINING,
And BLASTING
POWDER,

OF SUPERIOR QUALITY, FRESH FROM THE
MILLS. It being constantly received and transported
into the interior, is delivered to the consumer within a
few days of the time of its manufacture, and is in every
way superior to any other Powder in Market.
We have been awarded excoessively

Three Gold Medals
By the MECHANICS' INSTITUTE and the STATE AG-
RICULTURAL SOCIETY for the superiority of our
products over all others.
We also call attention to our

HERCULES POWDER,
Which combines all the force of other strong explosives
now in use, and the lifting force of the best blasting
powder, thus making it vastly superior to any other
compound now in use.
A circular containing a full description of this Pow-
der can be obtained on application to our Office.

DESIGNS AND PLANS
—FOR THE—
NEW CITY HALL
—OF—
SAN FRANCISCO.

Office Board of City Hall Commissioners, southeast
corner of Sacramento and Montgomery streets, San
Francisco, June 22, 1870.

The Board of City Hall Commissioners hereby give
notice that they will be prepared to receive at their
office, on or before the FIRST DAY OF NOVEMBER
NEXT, designs and plans for the new City Hall of San
Francisco.

The Commissioners, in order to obtain the very best
design and plan, invite the fullest competition among
architects, and to this end have resolved to offer the fol-
lowing premiums:

First—For the design and plan selected and
adopted.....\$2,500
Second—For the second best design and plan..... 2,000
Third—For the third best design and plan..... 1,500
Fourth—For the fourth best design and plan..... 1,000
Fifth—For the fifth best design and plan..... 500
The premiums payable in City Hall warrants.

As a guide to architects in the preparation of the de-
signs and plans, the Commissioners have prepared a
pamphlet containing full instructions and suggestions,
as well as the terms and conditions upon which the pre-
miums will be awarded.

Pamphlets can be had on application at the office of
the Commissioners.

Any design or plan in which the requirements of the
Board, as set forth in the printed instructions, have not
been reasonably complied with, will be rejected from
the competition.

P. H. O'NEAVAN, Chairman,
JOS. G. EASTLAND,
CHAS. E. McLANE,
City Hall Commissioners.

PAIN KILLER
PROF.
DAVIS & SON, PROVIDENCE, R. I.

This celebrated medicine has won a deservedly high
reputation as an alleviator of pain and a preserver of
health. It has become a household remedy, from the
fact that it gives immediate and permanent relief. It is
a purely vegetable preparation, made from the best and
purest materials, safe to keep and to use in every fam-
ily. It is recommended by physicians and persons of all
classes, and to day, after a public trial of thirty years—
the average life of man—it stands unrivalled and unex-
celled, spreading its usefulness over the wide world.
Its large and increasing sale affords positive evidence of
its enduring fame. We do not deem it necessary to say
much in its favor as one small bottle will do more to
convince you of its efficacy than all the advertisements
in the world. Give it one fair trial and you would not
be without it for ten times its cost.
Directions accompany each bottle.
Sold by all Druggists.
Price 25 cts., 50 cts., and \$1 per bottle.

NO FEAR OF A RELAPSE.—Thousands who suffer from
Chronic constipation, dare not take the order of purga-
tives, because the short relief they afford is followed by
still more terrible contraction and general aggravation
of the disease. For these the mild laxative, corrective,
and tonic operation of TARRANT'S EFFERVESCENT SELTZ-
ER APERIENT, is literally the one thing needful. Al-
most superceptibly, and without any gripping pain, it
restores the natural peristaltic motion of the bowels, while
it tones their muscular action, and thus prevents a
return of the contraction when the laxative action of
the agreeable and effervescent draught has subsided.

THE SCIENTIFIC PRESS.—To the minor and farmer we
consider the Press the most valuable publication on the
Pacific Coast. Every number contains matter of interest
to the farmer and general reader, and to the minor
the Press is a sine qua non.—Inq Independent

A New Mashing Machine for Brewers.

Hitherto mashing has been conducted by hand, by means of oars or wooden bars provided with cross-pieces at the end, or by various shaped machinery. The first method caused a too great loss of heat (as the tub was necessarily left uncovered during the process), which made the ale liable to sour, besides being inadequate for properly stirring the whole mass; the latter method obviated the first objection, but still did not effect a perfect permeation of the grain with water. Then machinery was used to mash the malt and water before it was put into the tub, but this heat the grain into a paste, destroying the pores and preventing the water from thoroughly saturating the malt and dissolving the soluble parts.

We now illustrate a new machine which has been invented for the purpose of avoiding all these troubles, and which, it is claimed, will make a thorough mash, of any required degree of consistency, without destroying the fibre of the grain, besides doing away with the aid of extraneous power.

In this machine the ground malt is placed in the hopper, A, the bottom of which is closed with a slide, F. By drawing out this slide, the malt drops down into a chamber, the bottom of which is formed by a slide, C, which has different sized openings, shown in the figures marked 2, 3 and 4, so that this regulates the flow of the malt and causes a thicker or thinner mash to be formed as may be desired. A door, D, enables the operator to watch and regulate this flow. From here malt falls on to a cone, H, which divides it equally and spreads it into a thin sheet. This falls into the space, I, where it is subjected to the action of water, discharged in small jets through holes from J and K. This water is heated to the proper temperature in a vessel on an upper floor, and introduced through the pipes, B. The mash then falls into the tub below the machine. When the malt is all through, the open slide, C, or 2, 3, 4, is replaced by a blank one, 1, the water is shut off, and the slide, F, is pushed in. Thus the escape of steam is effectually prevented. By means of the door, D, the machine can be readily cleaned.

The mixture in the tub is in the form of a perfect mash with every grain saturated and its structural character uninjured. After standing the usual time, and setting the taps, sparging only is necessary to draw off the whole of the extract, the water passing through the pores of the malt and extracting all the soluble portion in its passage, instead of forming channels and flowing down on the outside of the grain, as is usually the case. These claims seem to be well substantiated by practice.

Other important advantages are claimed. The device is self-acting and requires no expensive machinery. The extract produced is much larger in amount than that obtained by the old methods. The machine is simple, works easily, is durable and can be cleaned with the greatest ease. We understand that its use in several large breweries at the East has been attended with great success. The device was patented in July, 1870, and any further information can be obtained of John Trageser, Steam Copper Works, 447 West Twenty-Sixth St. New York City.

Notes on the State Fair.

[CONTINUED.]

The California sewing machine attracted much attention and admiration for its simplicity of construction and easy and complete operation. It is the invention of Mr. Sawdon, of Grass Valley, Nevada Co., and the right is owned by himself and Mr. Gray. Quite a number of machines have been sold to individuals acquainted with their superior worth in Grass Valley, where they are manufactured with limited facilities, and sold at a profit at prices some 30 per cent. lower than the rates for first class machines, over which this is claimed to be superior. This California invention is certainly very simple for the work it handsomely performs. It is a shuttle ma-

Huntington, Hopkins & Co., one of the heaviest hardware firms on this coast, made a creditable display, consisting of a large variety of goods typical of the character of their immense stock at No. 54 K street, Sacramento, which embodies first qualities of supplies for railways, miners, farmers and local mechanics. For the communities in the northern part of the State, this first rate house, located at the Capitol City, must be a real desideratum.

Our attention was called to the perfect cleaning and separating of the "Novelty Mill and Grain Separator," operated by R. Stone, Agent, of No. 422 Battery st., San Francisco. The perfect manner in which it separated a foul mixture of wheat and impurities, depositing the large kernels, the small and blasted berry, cheat, mustard

unnecessary, the hullion being worth more than coin.

Mr. Morgan is still experimenting and will in a short time have a working size machine from California, where the patentee is now applying his process on a large scale.

Mr. Morgan authorizes us to invite all persons interested in quartz and quartz machinery to examine this model machine, and see it work. It can be seen at How's mill in Brown's gulch. The cost of Paul's machine in St. Louis is \$1,200; weight of entire apparatus, 3 tons; capacity for twenty-four hours, 10 tons. With this machine will be necessary a five-stamp mill and one of Paul's pulverizers to reduce the ore preparatory to working in the cylinder.

We have scratched our head a many and many a day over quartz and quartz machinery, and, according to our idea, this is the process to raise us out of the "slough of despond."

Our Printed Mail List.

Subscribers will notice that their names are printed on colored paper and pasted upon each copy of the Press. This is done by machinery, to expedite the issue of our paper, the regular edition of which has become too large to be convenient to send out by the old method of writing the names. The figures found on the right of the pasted slips represent the date to which the subscriber has paid. For instance, 21st 70 shows that our patron has paid his subscription up to the 21st of September, 1870; 4j71, to the 4th of January, 1871; 4j10, to the 4th of July, 1870. The inverted letters occasionally used are marks of reference, simply for the convenience of the publishers.

In setting up the list the compositor made some few errors which have been rectified by a careful revision and comparison with the mail book. If errors in the accounts of subscribers occur at any time an early notice will secure their immediate correction.

If names, initials, or the address in any particular is wrong or incomplete we wish to be favored with a notification of the fact.

SCIENTIFIC PRESS.—We are pleased to learn that the circulation of this valuable journal is rapidly increasing in all the States and territories on the Pacific Coast. The efforts of the proprietors of the SCIENTIFIC PRESS, Messrs. Dewey & Co., to furnish a reliable paper for the miner, farmer, mechanic and inventor, are successful, and their paper has obtained an enviable reputation for ability and truthfulness. P. McCarty, travelling and corresponding agent for the SCIENTIFIC PRESS, is now in town, and has succeeded in securing a large addition to its subscription list in Nevada and Placer counties.—*Nevada Gazette*.

NEW VOLUME.—The San Francisco SCIENTIFIC PRESS has entered its 21st volume, and is one of the most valuable journals published. Containing, as it does, articles on every branch of home industry, the sciences, arts, etc., the PRESS should find its way into every hamlet in the land. The four dollars expended for a year's subscription to this journal may be repaid by the information gained by the perusal of only one number.—*Alpine Chronicle*.

THE SCIENTIFIC PRESS.—An illustrated Pacific States weekly, devoted to mining, farming, mechanic arts and industrial progress, generally, but especially in the west. This work is published in San Francisco, at \$4 per annum. Mr. M. is here to canvass for subscribers, with specimens of the work, which we can commend to our readers the general public.—*Deseret Daily News, Salt Lake*.

TREATMENT OF REBELLIOUS SILVER ORES by Charles H. Aaron—a pamphlet of eight pages of concise reading, of practical value to parties interested in the subject. Printed and sold by Dewey & Co., at this office, for 25 cents, post paid.

TO MINERS, MILLMEN AND METALLURGISTS. Kustel's new work on the Concentration of all kinds of Ores, and the Chlorination Process, for Gold-bearing Sulphurets, Arseniurets, and Gold and Silver Ores generally, is the best and most complete work issued. It contains 120 diagrams, illustrating machinery, etc., which alone are of the greatest value. Price, \$7.50, postage paid. Published by Dewey & Co., publishers of the Scientific Press, San Francisco.

SCIENTIFIC PRESS, FROM SAN FRANCISCO. This Mining, Farming and Mechanic Arts Journal, after a most singular absence from our table, has again made its appearance and is heartily welcomed. It is the recognized mining organ of the Pacific coast, and rightly so, since it is conducted ably and honestly in all respects. It scorns bumbag and avoids all merely speculative commendations of sudden discoveries in the treatment of ores. The reliability of the Press in all matters pertaining to mines and mining news, makes it a most desirable paper for our people here. Per annum, \$4.—*Colorado Herald, July 6th*.

THE large majority of United States and Foreign Patents granted to inventors on the Pacific coast during the past few years, have been obtained through the agency of DEWEY & Co., publishers of the SCIENTIFIC PRESS. Established in the year 1860, we have an extensive patent library, with full record of cases on this coast, and can give the best and most reliable advice as to the patentability of new inventions.

HARRIS' PATENT SELF-ACTING MASHING MACHINE FOR THE USE OF BREWERS.

chine and runs with great ease, making stitches alike on both sides—similar to the Singer. The feed motion which governs the length of the stitches is regulated without stopping the work. Mr. S. is a young man who was brought up a mechanic in his father's establishment in Europe, and came to Grass Valley six months ago penniless, but with a will to work and accomplish something, which brought encouragement from those who admire willing hands and industrious minds, and the result is that a mountain town in this State now claims the commencement of a home manufacturing enterprise that promises much future benefit to the State.

The California Silk Company made an interesting exhibit of some of Mr. Shaw's paintings, from his studio in the Mercantile Library Building, S. F., which were quite admirable.

The huge, revolving, diamond-shaped, glass lottery box, [Mercantile Library (mis)fortune shaker] attracted admiration for the ingenuity of the inventor, and a good many uncomplimentary remarks for the scheme which called it into existence. The box, diamond shaped, contains various rows of iron teeth for stirrers inside, and has an almost universal rotating motion for mixing up the tickets.

Parker & Hunt, of Sacramento, exhibited Blakslee & Williams steam jet pump, an Eastern invention possessed of considerable novelty. It operates by vacuum produced by condensing steam, with very little apparatus, and we should think it very applicable for certain purposes.

seed, and the coarser foreign particles in separate receptacles was very satisfactory. We want to improve the quality of our seed grain and flour in this State, and would recommend parties who cannot examine this mill in person, to read the illustrated description given in our issue of Sept. 10th, 1870.

The Paul Process in Montana.

A Montana paper gives the following with regard to Mr. Paul's process, which has been tried at or near Nevada City, Montana:

We visited a mill a few days since, where this process is being applied on refractory ores. Although only on a small scale, still it has proven an entire success, and we are satisfied it is destined to work a complete revolution in our present system of working both gold and silver ores. Mr. Morgan, the gentleman who is experimenting with the model machine, was very kind in giving us every information in regard to the machine, and the mode of working the same, and as near as we can we will now explain to our readers.

Mr. Morgan has saved 90 per cent. of assay value of ore, by this process, (though his little machine is very imperfect); while from same ore, by old process, he was able to save but 40 per cent. and this greater saving of precious metals is not its only virtue. It delivers the gold and silver in almost a chemically pure state—say from 950:1000 to 995:1000 fine.

For instance—Mr. Morgan worked by old process, and from it obtained bullion that was only 61:1000 fine; the same ore, by the Paul process, not only returned twice as much bullion in value, but the same was also 975:1000 fine, or almost entirely free from base metals, which renders cupelling

Mining and Company Advt's.

Columbus Mining Company.—Location:
Roach Hill, Placer County, California.
Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty-eighth day of September, 1870, an assessment of seventy-five (75) cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary, 419 California street, San Francisco, California.

Any stock upon which said assessment shall remain unpaid on the second day of November, 1870, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Saturday, the nineteenth day of November, 1870, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

A. NOEL, Secretary.
Office, 419 California Street, San Francisco, Cal.

CAUTION.

Eagle Quicksilver Mining Company.—Location of Mines: Eagle Mining District, Santa Barbara County, California.

Notice is hereby given to the public not to purchase, or negotiate for the following named shares, designated by the names of the delinquent owners in the Eagle Quicksilver Mining Company, as by law, and the Articles of agreement provided, they were duly advertised and sold in full at public auction, by John Middleton & Son, Auctioneers, on Monday the 26th day of September 1870, for delinquent assessments thereon, and accruing costs of advertising and sale, and will not be transferred by said Company.

And in accordance with law and an order of the Board of Trustees, made on the fifteenth day of August, 1870, so many shares of each parcel of said stock as may be necessary will be sold at the office of the Company, 614 Merchant street, Room 26, San Francisco, California, on Monday, the third day of October, 1870, at the hour of 2 o'clock P. M., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

A. MARTINON, Secretary
Office, 614 Merchant street, Room 26, San Francisco, California. sept-17

La Blanca Gold and Silver Mining Company.—Location of Works: District of Ures, State of Sonora, Mexico.

Notice is hereby given that the annual meeting of the Stockholders of the above named company will be held on Monday the tenth day of October 1870, at the office of the Company, No. 312 Front Street, San Francisco California, for the purpose of electing Trustees for the ensuing year, and for the transaction of any other business as shall properly come before the meeting. By order of the President,

JOS. GOLDMAN, Secretary.

CAUTION.

North America Consolidated Mining Company.—Location of Works: White Pine County, State of Nevada.

Notice is hereby given that the following named shares designated by the number of their respective Certificates in the Capital Stock of the North America Consolidated Mining Company, as by law provided, were duly advertised and sold in full at public auction by John Middleton & Son, on Wednesday, the 7th day of Sept. 1870, for delinquent assessments thereon, and accruing costs of advertising and sale, and will not be transferred by said Company.

No. 302 Montgomery Street, San Francisco California.
September 28, 1870. 14v21-1t

Silver Sprout Mining Company.—Location of Works and Mines: Kearnsarge District, Inyo County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 29th day of August, 1870, an assessment of twenty-five (25) cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary, at the office of the Company, No. 405 California street, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on the eighteenth day of October, 1870, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Thursday, the first (1st) day of December, 1870, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

T. B. WINOARD, Secretary.
Office, 405 California street, San Francisco, Cal.

MARAVILLA COCOA. For Breakfast.—The Globe says: "Various importers and manufacturers have attempted to attain a reputation for their prepared Cocos, but we doubt whether any thorough success has been achieved until Messrs. Taylor Brothers discovered the extraordinary qualities of 'Maravilla' Cocoa. Adapting their perfect system of preparation to this finest of all species of the Theobroma they have produced an article which surpasses every other Cocoa in the market. Entire solubility, a delicate aroma, and a rare concentration of the purest elements of nutrition, distinguish the Maravilla Cocoa above all others. For homeopaths and invalids we could not recommend a more agreeable or valuable beverage." Sold in packets only by all Grocers, of whom also may be had Taylor Brothers' Original Homoeopathic Cocoa and the Solid Soluble Chocolate. Steam Mills—Brick Lane, London. 5v20-1y

ENCOURAGING REMARKS.—One of our readers writes: "Incorporating an agricultural department into your paper has made it acceptable and really useful all over the country west of the Rocky Mountains, and probably further; and for my part I do not see how an intelligent farmer, miner or mechanic can do without it."

ROOT'S PATENT FORCE BLAST ROTARY BLOWER.

MANUFACTURED BY KEEP & BARGION,

At the Globe Iron Works, Stockton, California.

Awarded the First Premium at the Paris Exposition.

Patented Nov. 1st, 1864, July 21, 1866, and Oct. 9, 1866.

ADAPTED FOR Smelting, Foundry, Mining and Steamships.

REQUIRES Fifty Per Cent. LESS POWER Than any Blower Now in use.

One of these Blowers may be seen on exhibition at W. T. Jarratt's Brass Foundry, corner of Mission and Fremont street. They are also in use at the Almaden Quicksilver Mine; Gridley's Foundry, Gold Hill, Nevada; Jena Iron Works, San Francisco, and many other places.

CAUTION.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirement of the genuine article.

Quartz, Saw and Grist Mill Irons, Steam Engines, Horse Powers, High and Low Pressure Steam Engines, Steamboats and Propellers, made at short notice.

NOVELTY MILL AND GRAIN SEPEARATOR.

THE undersigned having purchased of the Patente, WIRTS & SWIFT, of Hudson, Michigan, their right to this mill, Patented June 22d, 1869, for California, Oregon, Washington Territory, Montana, Utah, New Mexico and Arizona, wishes to call the attention of FARMERS, MILLERS AND GRAIN DEALERS to one of THE GREATEST IMPROVEMENTS OF THE AGE for cleaning and separating grain. While it combines all the essential qualities of a first-class FANNING MILL, it also far exceeds anything that has ever been invented for the separation of grain. It has been thoroughly tested on all the different kinds of mixed grain, separating all the different seeds in almost a magical manner, placing them in their different compartments in the mill arranged for their reception, at the same time taking out all the Mustard, Grass Seed, Barley and Oats, and making two distinct qualities of wheat if desired, thereby selecting superior, large plump and perfect kernels for SEEN WHEAT, and all the small and cut kernels, such as merchantable wheat, is deposited in another compartment. By the use of this Mill a great quantity of wheat usually sown that has been cleaned in the common mills will be saved to the farmer, as the cut or shrunken kernels will never germinate.

The above mentioned Novelty Mill is the only mill known to possess all these superior qualifications, and was exhibited and tested at the last Michigan State Fair held at Jackson, Michigan, September 21, 22, and 23, 1869, and here won the palm over some thirty other different mills from all parts of the United States, including the famous Dicky Mill of Racine, Wisconsin. All who have witnessed here the operations of the NOVELTY MILL, declare its perfection, and the most beneficial invention to the Farmers, Millers, and Grain Dealers ever introduced on the Pacific Coast. The farmers in Santa Clara County, are loud in its praise, and also in other parts of the State where it is being introduced. No. 1 Mill, complete, is capable of cleaning 25 tons of grain per day; No. 2 Mill, 15 tons; No. 3 Mill, 8 tons. A large number of recommendations and certificates of the practical working of the mill will be furnished. Circulars containing references sent free by mail. N. B. Town, County, or State Rights for sale on favorable terms. For further particulars apply to

R. STONE, 423 Battery Street, San Francisco.

THE WILSON
Patent Steam Stamp Mill.

This extraordinary Mill, now so justly popular in the East, is now offered to the miners of the Pacific Coast, having been in operation now for about two and a half years, the Company feel confident that the

WILSON STEAM STAMP MILL,
For Durability, Efficiency,
AND ECONOMY OF WORKING,
HAS NO EQUAL.

The Wilson Steam Stamp Mill is the only Steam Mill that has had the severe ordeal of practical working, and proved itself eminently successful. It is now in operation in several of the Eastern States and Territories, and gaining an evanescent popularity. The whole machine is so simple as to be readily understood by the most ordinary minds. In fact, its simplicity is its durability. The expense of crushing rock or cement with this Mill is less than one-half the expense of any other Stamp Mill, and less than one-half the cost. For further particulars inquire of

FURMAN R. WILSON,
San Francisco.

Or of THE WILSON STEAM STAMP MILL CO., 326 Walnut street, Philadelphia, Pa.

NOTICE.—All persons are hereby warned not to manufacture or use any Steam Stamp Mills that are an infringement on the Wilson Patents, as they will be prosecuted to the utmost rigor of the law.

F. R. WILSON,
207 1/2 St. W. P. S. S. M. Co., Philadelphia.

VARNEY'S
PATENT AMALGAMATOR.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:
Thapan being filled, the motion of the miller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is drawn to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Sellers made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and settlers for themselves, at the office, 229 Fremont street, San Francisco.

AGENTS—MORRIS & WHITE, 90, Fremont, St. S. F.

Patent Hydraulic Pipe Nozzle.

HARRIS & KLEMMER,
La Porte; Plumas Co., Cal.

HAVE ON HAND AND FOR SALE, a number of their New Hydraulic Pipe Nozzles, recently invented and patented by Mr. Harris.

The cut shows a section of the Nozzle and the lever by the action of which, the different sized rings, as shown, may be drawn and inserted to change the size of the stream instantly and without stopping it. Experienced miners have only to examine the operation of this improvement and its working effects, to become thoroughly convinced of its importance and value.

These Nozzles are used in La Porte and every mining camp in Plumas county; also the following camps in Sierra county: Morristown, Seales, Diggle, La Porte, and at Suck-er Flat in Butte county, and in every instance have given perfect satisfaction. Every miner who has seen them work pronounces them superior to any nozzle now in use.

HARRIS & KLEMMER, La Porte, Plumas County.

WE have used the above mentioned Nozzles during the present season, and hesitate not to pronounce them an entire success.

S. M. BOYCE, E. W. BOYCE, 11v21-3m

HOWLAND PATENT ROTARY BATTERY

of 12 stamps. It requires no frame to put it up. Guaranteed to crush 1 1/2 to 3 tons per day to the stamp. The best Battery ever used for amalgamating gold, or crushing silver ores, dry or wet. Can be put up on a mine in running order for one-half the price of the straight battery, and in three days after its arrival at the mine. 12-stamp battery, 20,000 pounds, with frame complete, price \$3,000; 6-stamp battery, 8,000 pounds, price \$1,300. All prices named to be paid in currency. Every mill run at shop before shipping.

California Stamp Mills.

All the various styles of Pans, Amalgamators, Separators, Settlers, Concentrators, Dry or Wet, for working Gold, Silver or Copper Ores, the same as built in California and at lower prices. SHOES AND DIES made of the best white iron. Send sizes and we will make patterns and forward Shoes and Dies at low prices. Engines, Boilers and fixtures, and other Machinery made to order. Also, Howland's Patent Rotary Valve Double or Single Engines.

Irons for the best California 10-stamp mill, straight battery, complete, \$1,600. Irons for low mortar, old style mill, much less. Send for a Circular.

MOREY & SPERRY,
95 Liberty street, New York.

N. B.—Mr. W. H. HOWLAND, formerly of the Miners' Foundry, is now in San Francisco for a short time, and will receive orders for mining and other Machinery of Eastern manufacture at the lowest rates and most favorable terms. Orders may be left at S. W. HOWLAND & CO'S, 413 and 415 Mission street, between First and Fremont, San Francisco. 4v21-3m

SEVERANCE HOLT & CO.,

MAUFACTURERS OF
Diamond-Pointed Drills

AND DRILLING MACHINERY.

For Mining, Quarrying, Shafting, Tunneling, Prospecting, Draining, Grading and Submarine Blasting. Special attention given to Deep Boring for testing the value of Mines. Also to Boring Artesian Wells. Office, 318 CALIFORNIA STREET, San Francisco. 25v20-3m

Thursday Evening.

Owing to the time necessary to mail the present large edition of the SCIENTIFIC PRESS, we are obliged to go to press on Thursday evening—which is the very latest hour we can receive advertisements.

Patents and Inventions.

A Full List of Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS TO DEWEY & CO., U. S. AND FOREIGN PATENT AGENTS, AND PUBLISHERS OF THE SCIENTIFIC PRESS.]

FOR THE WEEK ENDING SEPTEMBER 20TH.

REMOVING BURRS FROM WOOL.—Peter Casson, San Francisco, Cal.

BALANCED SLIDE-VALVE.—Orrin Collier and William Henry Masterman, Sacramento, Cal.

LUBRICATOR.—John Gates, Portland, Oregon.

GANG-PLow BEAM.—James W. Suraa, San Francisco, Cal.

CAR-COUPPLING.—William Walker, Woodside, Cal., assignor to himself and Robert O. Tripp.

PRUNING-SHEARS.—Frederick A. Will, San Francisco, Cal.

PRESERVING AND HARDENING WOOD.—Benjamin R. Nickerson, San Francisco, Cal.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO., in the shortest time possible (by telegraph or otherwise), at the lowest rates. All patent business for Pacific coast inventors transacted with greater security and in much less time than by any other agency.

The New Patent Act.

AN ACT TO REVISE, CONSOLIDATE AND AMEND THE STATUTES RELATING TO PATENTS AND COPYRIGHTS.

APPROVED, JULY 8, 1870.

[CONTINUED FROM PAGE 223.]

SEC. 55. And be it further enacted, That all actions, suits, controversies, and cases arising under the patent laws of the United States shall be originally cognizable, as well in equity as at law, by the Circuit Courts of the United States, or any District Court having the power and jurisdiction of a Circuit Court, or by the Supreme Court of the District of Columbia or of any Territory; and the court shall have power, upon bill in equity, filed by any party aggrieved, to grant injunctions according to the course and principle of courts of equity, to prevent the violation of any right secured by patent, on such terms as the court may deem reasonable; and upon the decree being rendered in any such case for an infringement, the complainant shall be entitled to recover in addition to the profits to be accounted for by the defendant, the damages the complainant has sustained thereby, and the court shall assess the same, or cause the same to be assessed under its direction, and the court shall have the same powers to increase the same, in its discretion, that are given by said act to increase the damages found by verdicts in actions upon the case; but all actions shall be brought during the term for which the letters patent shall be granted or extended, or within six years after the expiration thereof.

SEC. 56. And be it further enacted, That a writ of error or appeal to the Supreme Court of the United States shall lie from all judgments and decrees of any Circuit Court, or of any District Court exercising the jurisdiction of a Circuit Court, or of the Supreme Court of the District of Columbia, or of any Territory, in any action, suit, controversy, or case, at law or in equity, touching patent rights, in the same manner and under the same circumstances as in other judgments and decrees of such Circuit Courts without regard to sum or value in controversy.

SEC. 57. And be it further enacted, That written or printed copies of any records, books, papers, or drawings belonging to the Patent Office, and of letters patent under the signature of the Commissioner, or acting commissioner, with the seal of office affixed, shall be competent evidence in all cases wherein the originals could be evidence, and any person making application therefor, and paying the fee required by law, shall have certified copies thereof. And copies of the specifications and drawings of foreign letters patent, of record in the Patent Office, certified in like manner, shall be prima facie evidence of the fact of the granting of such foreign letters patent, and of the date and contents thereof.

SEC. 58. And be it further enacted, That whenever there shall be interfering patents, any person interested in any one of such interfering patents, or in the working of the invention claimed under either of such patents, may have relief against the patentee and all parties interested under him by suit in equity against the owners of the interfering patent; and the court having cognizance thereof, as heretofore provided, on notice to adverse parties, and after due proceedings had, according to the course of equity, may adjudge and declare either of the patents void in whole or in part, or inoperative, or invalid in any particular part of the United States, according to the interests of the parties in the patent or invention patented. But no such judgment or adjudication shall affect the rights of any person, except the parties to the suit and those deriving title under them subsequent to the rendition of such judgment.

SEC. 59. And be it further enacted, That damages for the infringement of any patent may be recovered by action on the case in any Circuit Court of the United States, or District Court exercising the jurisdiction of a Circuit Court, or in the Supreme Court of the District of Columbia, or of any Territory, in the name of the party interested, either as patentee, assignee, or grantee. And whenever in any such action a verdict shall be rendered for the plaintiff, the Court may enter judgment thereon for any sum above the amount found by the verdict as the actual damages sustained, according to the circumstances of the case, not exceeding three times the amount of such verdict, together with the costs.

[To be continued.]

THE SCIENTIFIC PRESS is one of the most interesting of our Exchanges, and is especially devoted to giving full accounts of mines and all new inventions and improvements in mining machinery, and machinery of all kinds. It also contains a general review of mining operations in all parts of the United States, with an epitome of the latest mining news, selected from the local papers of each district. All very interesting to miners and machinists.—*Helena Gardle.*

To Eastern Readers.

We fully believe that all the leading and intelligent seeking Mechanics, Manufacturers, Farmers and Miners in the Atlantic States, who venture to subscribe for the SCIENTIFIC PRESS in its present improved standard, will feel more than paid for their \$4 investment. We are adding new names for every issue from various parts of the Union.

"SPAULDING'S GLUE," handy and useful.

PHOTOGRAPHY.—FOR CABINET PHOTOGRAPHS, OR ENAMELED CARDS, of the very best quality, you must go to the NEW YORK GALLERY, Nos. 25 and 27 Third street, San Francisco. Every picture warranted to give satisfaction. 10v18-6m B. F. HOWLAND.

BOILER FELTING SAVES twenty-five per cent. of fuel. BERRY & PLACE'S MACHINERY DEPOT, No. 114 California street. 1v21-3m

BLOCK TIN AND SOLDER WIRE, broom wire, piano covering wire, etc., manufactured by Joshua Gray, 437 Brannan street. 2v19-5m

HAVING had numerous applications to purchase the right to manufacture CHAMPAGNE MEAD (the great temperance drink), we will state that we are now prepared to sell State and County Rights on reasonable terms. KENTON, GARRA & CO. San Francisco, July 10, 1870. 2v21-3m

DEWEY & CO.

American and Foreign

Patent Agents.

Scientific Press Office, 414 Clay Street, SAN FRANCISCO.

Patents Obtained Promptly. Caveats Filed Expeditiously. Patent Reissues Taken Out. Patents Secured in Foreign Lands. Assignments Made and Recorded in Legal Form. Copies of Patents and Assignments Procured. Examinations of Patents made here and at Washington. Examinations made of Assignments Recorded in Washington. Examinations Ordered and Reported by TELEGRAPH. Rejected Cases taken up and Patents Obtained. Interference Prosecuted. Opinions Rendered regarding the Validity of Patents and Assignments. Every Legitimate Branch of Patent Agency Business promptly and thoroughly conducted, ILLUSTRATED CIRCULARS FREE.

DEWEY & CO.,

Publishers and Patent Agents, No. 414 Clay street below Sansome, San Francisco.

IMPORTANT BOOK!

JUST ISSUED.—Roasting of Gold and Silver Ores, and the Extraction of their Respective Metals without Quicksilver. By G. Kustel, Mining Engineer and Metallurgist; Author of "Nevada and California Processes of Silver and Gold Extraction," and "Concentration of all Kinds of Ore."

Illustrated by numerous engravings. Published and sold by Dewey & Co., proprietors SCIENTIFIC PRESS, San Francisco.

This Book contains 120 pages. Price, \$2.50, gold, or \$3 currency, postage paid.

PATENTEES

Who have failed in their efforts to dispose of their rights are invited to consult us, either personally or by mail, free of charge. Many valuable inventions are lying dormant, for want of proper management, that might realize a fortune for their owners, if placed in the hands of competent agents, and brought to the attention of capitalists. We accept only those showing decided merit, as no others can be negotiated. A candid opinion can therefore be relied upon. Commissions dependent upon success. Inclose stamp for full information.

Reference on application. E. E. ROBERTS & CO., Consulting Engineers, 15 Wall street, New York. 14v213m16p

ENGRAVING ON WOOD

DESIGNING AND ENGRAVING on wood and for electrotype cuts of every description, done by superior artists at the office of the SCIENTIFIC PRESS. Fine Cuts made for Book and Newspaper Illustrations, and for Fancy Labels for printing in various colors; Monograms, Seals, etc., etc. Prompt execution and reasonable prices.

DEWEY & CO., No. 414 Clay street, S. F.

PATENT AGENCY DEWEY & CO.

PUBLISHERS AND PROPRIETORS OF THE SCIENTIFIC PRESS. Principal Agents west of the Mississippi—Established 1850. Our appointments are substantial, reliable and complete, for securing patents in the U. S. and EVERY COUNTRY IN THE WORLD where patents are allowed. Our business is large and our exceedingly successful practice justifies the assertion that Pacific Coast inventors can invariably secure their rights at a great deal quicker, and more perfectly, through us, than by any other solicitors—and at favorable rates. Illustrated pamphlets, containing a digest of

PATENT LAWS.

Rights of Inventor and Patentees, Mechanical Movements, Form of Caveats, Assignments, etc., sent free. Every legitimate branch of Patent Soliciting transacted sound legal and confidential advice given, by mail or otherwise.

Sheffield Scientific School OF Yale College, New Haven, Conn. This department of Yale College, instituted in 1840, and endowed with the National Land Grant in 1866, furnishes advanced instruction in the various branches of Mathematical, Physical, and Natural Science. The School is under the direction of the President of the College, a Board of thirteen Professors in different specialties, and six assistant instructors. The courses of study leading to the degree of Bachelor of Philosophy, conferred by Yale College, are arranged as follows: 1—CHEMISTRY AND MINERALOGY. 2—CIVIL ENGINEERING. 3—MECHANICAL ENGINEERING. 4—MINING ENGINEERING AND METALLURGY. 5—AGRICULTURE. 6—NATURAL HISTORY AND GEOLOGY. and 7—SELECT COURSES. Advanced students are also admitted to optional courses, and if already College graduates, are received as candidates for the degree of Doctor of Philosophy. Tuition, \$125 per year of forty weeks. The Libraries, Museums, Laboratories and Apparatus accessible to students, are varied and extensive. For copies of the Annual Circular and Report, letters may be addressed to the "Secretary of the Sheffield Scientific School," New Haven, Conn. 16-1y16p

SCIENTIFIC PRESS

AN ILLUSTRATED JOURNAL OF SCIENTIFIC AND INDUSTRIAL PROGRESS,

Miner, Farming and Mechanic Arts.

BY DEWEY & CO.,
Patent Solicitors.

San Francisco, Saturday, October 8, 1870.

VOLUME XXI.
Number 15.

Farming Edition.

Academy of Sciences.

The regular meeting of the Academy was held on Monday evening, Dr. Blake presiding. Four gentlemen were elected resident members, and one was elected corresponding member. A number of specimens were presented to the cabinet—among them a piece of coal, resembling anthracite, from Queen Charlotte's Island; the skull of an Apache Indian; the skull of an animal found 40 feet below the surface in an asphaltum bed on Asphaltum Ranch, Los Angeles county; a package of Australian plants etc.

Dr. Blake had paid a short visit to the forest of petrified trees near Calistoga. He found no roots anywhere. He came to the idea that the trees had been swept away from their original position by a flood and deposited in this place. An examination of the argillaceous sandstone formation and of the various aspects of the locality would lead him to suppose that the waters held volcanic material, that is the debris washed from decomposed rock; that the sandstone was deposited here and the trees at the same time; that the strata had been subsequently tilted to an angle of 45°, their present angle, and thereby the trees broken very likely, and the soft parts of the rock washing away they were exposed on the new surface; that the idea might be proposed that, from the decomposed rock, considerable silicate of potash was held in the water, and this reagent had been prominent in silicifying the trees. He thought these last were dicotyledons. His examination had been, however, more superficial than he could desire, on account of want of sufficient time.

Dr. Blake remarked on the different colored strata of water which is so noticeable in our bay. He had previously thought that the clearer portions were sea water, and the muddier the water from the inflowing streams. On testing with a thermometer, he found that these strata were of different temperatures, the difference being clearly marked and amounting often to 2 or 2½ degrees (65° and 67½°). The muddy and colder water is in-coming tide, which goes up the bay, deposits its sediment, returning purer (and warmer) to the sea. This would denote a filling up of the inner bays. This non-mixing of colder and warmer streams of water has been noticed in deep-sea dredging, etc. Similar phenomena have been noticed with regard to warmer and colder currents of air existing side by side.

Some little discussion ensued on the the various points brought forward in these remarks.

THE STEINFELDT FURNACE and the mill recently erected at Mineral Hill were started last week and are reported as doing excellently from the start. Upwards of 1,000 tons of \$300 ore are said to be on hand.

Device for Filling Locomotive Tanks.

In England, devices for filling locomotive tanks without stopping have been in

A trough, *g*, about 600 feet long, is placed between the rails on a level portion of the track, and partly filled with water. Attached to the tender is a scoop, *h*, which

"JERK WATER" FOR FILLING LOCOMOTIVE TANKS.

use for some time. Lately, the managers of the Hudson River Railroad in New York have put in use a similar device, which has been perfected and adapted to the requirements of the road by Mr. Buchanan, Superintendent of machinery of that company. The *Chicago Railroad Gazette*, one of our best exchanges, has illustrated the apparatus, which we copy in our present issue.

is provided with a joint, *f*, so that the lower part can be raised or lowered into the trough, by means of a lever (not shown in the cut) connected by a rod, *k*, to the arms, *d*, and *e*, which work on a shaft, *c*. The lower, or movable part, *h*, of the scoop is of sheet copper, and the pipe, *a*, above the joint is of cast iron. More water is carried into the tank by contracting the neck of the scoop than by having the same

sectional area all the way. Mr. Buchanan found that when the mouth of the scoop was flared or spread laterally, much more water was wasted or thrown out of the trough than when the sides of the scoop were left parallel.

Just before the train comes to a trough, the fireman unfastens the lever and is ready to drop the scoop, which dips only two inches below the surface of the water, but raises such a wave before it that its mouth 5 inches high and 10 inches wide, is entirely filled. An engine can run at a rate of thirty miles an hour and take up a thousand or twelve hundred gallons in a few seconds. When running at a high speed, very considerable muscular exertion is necessary to raise the scoop out of the water, requiring all the strength of an ordinary man. There is a long incline at each end of the trough so that there may as little damage result as possible, should the scoop not be lifted at the proper moment.

A suggestion has been made that the arrangement could be applied for supplying water to cattle which are being transported by rail.

LIGHTING MINES WITH GAS.—A new apparatus has been tried in England for supplying mines with burning gas at a much lower level than the gas holder. A steam jet is used to draw the gas into and force it down a pipe leading to the bottom of the mine. Arriving at the proper point, the stream of gas and steam is led into a proper vessel, where the steam is condensed and, as water, is taken off by a syphon pipe, while the gas is led off by a pipe at the top to the burners. According to the *London Mining Journal*, at the Darfield Main Colliery, one of the deepest in South Yorkshire, the gas was carried down 1,005 feet and supplied to three districts to an extent in each of about 300 feet in length. The entire cost of the appliances here was less than \$2,000.

NEW SMELTING WORKS.—According to the *Colorado Herald*, another attempt is to be made to establish smelting works in the neighborhood of Central City,—by whom, is not stated, except that it is a person of great knowledge and experience. It is proposed to roast the ore in kilns, and to smelt in shaft furnaces for matt, which is roasted, and smelted again to a concentrated matt. This is to be treated in "one of the various methods in use" to obtain the valuable metals. The establishment and successful operation of new works at Central, and the competition which would follow, would greatly benefit the miners there. Whether such works can succeed, however, remains to be seen.

DEPARTED.—On the 27th of September, Henry P. Comstock, the discoverer of the Comstock lode, committed suicide near Bozeman City, Montana, by shooting himself in the head while laboring, as it is supposed, under a fit of temporary insanity. He, who led to the enrichment of the world to a vast extent, was unable to make himself rich.

Communications.

IN THIS DEPARTMENT we invite the FREE DISCUSSION of all proper subjects—correspondents alone being responsible for the ideas they advance.

Notes of Travel in Nevada County.

[WRITTEN FOR THE SCIENTIFIC PRESS.]

Nevada City—its Mines, Manufactures, Etc. Nevada City, county seat of this county, contains about 5,000 inhabitants and is one of the prettiest inland cities in the State. It may be better described as a complete orchard and nursery, fruit free in every yard and going to waste. I believe that in and around this city were cradled all the hydraulic devices now in use in this State, viz: Allenwood's Goose-Neck, Craig's Globe, Jacob's Monitor, Fisher's Hydraulic Chief and Shoo Fly, Hoskin's Globe Monitor, Shaw's Gold Hunter, Mitchell's Hydraulic device and Watson's Champion—of each of which I will speak at length as I find them at work in my travels through the mines.

One of the most extensive deep channels in the State runs across the county from east of south to west of north; from Little York, on the east, through You Bet, Red Dog, Hunt's Hill, Quaker Hill, Blue Tent, Grisley Hill, North Bloomfield, and extending to and through Sierra county, on the west. It is from 50 to 500 feet deep, and the deep channel is from 500 to 1,000 feet wide. The hydraulic washings extend from 2 to 8 miles in width on the east side, and over the deep channel this belt can be traced almost across the State, through Placer, Nevada and Sierra counties. This channel passes about 5 miles to the east of Nevada City, and out of 80 miles of this lead in this county, but about one and a half miles have been worked. The poorest spot upon the lead as far as has been prospected, will pay by hydraulic process, and in the opinion of a large majority I meet, if labor was reduced (*i. e.* good labor), say to \$2 per day, employment would be given to 2,000 more men immediately to develop this one channel. I will mention a few of the many hundreds of Nevada quartz lodes.

The Star Spangled Banner,

W. S. Tisdale Superintendent, is situated about three and half miles north of Nevada City. The shaft is down 620 feet, and are now working the sixth level. The mill has 40 stamps and can crush 60 tons per day. They have 12 Cralls waltzing pans, and 3 engines—at the mill 150 horse power, at the hoisting works, two 10-inch engines. The average pay of their rock is \$18 per ton, with a vein 4 feet wide. They have also, one Varney rock-breaker, capacity 90 tons per day (10 hours). Value of improvements, \$90,000. The company own 2,000 feet of this lode; they have 30,000 cords of wood standing and cut, and have already burnt 1,600 cords.

The Pennsylvania

Is about one mile northwest of the Nevada, has been worked successfully during the years of 1865, 1866 and 1867, when it was closed down for causes unknown. The mine has been opened under the superintendence of Harvey Helm and is now doing a fine business. Ore yielding as high as \$50 per ton.

The Orleans Ledge

Is situated one mile south of Nevada, on Gold Flat. There has been considerable ore taken from this vein, yielding from \$12 to \$40 per ton. Some of the ore is now at Stile's mill for reduction. It is in a slate range a short distance from the famous Pittsburgh mine, formerly known as the Whigham mine.

The Mulbury Ledges

Is situated a short distance north of the Pittsburgh. A number of crushings have been taken from this lode, which were worked at Stile's custom mill and fine returns made, some yielding about \$19 per ton. This was the last test made. They now have an 8-horse engine, with four-inch pump and hoisting gear, and are engaged in taking out large quantities of ore.

The Manhattan Ledge

Is about three quarters of a mile east of the Pittsburgh mine, which has been mentioned at length in the Press several times, and has upon it hoisting works of about the same capacity as the Mulbury. Fine prospects have been obtained. At present it is lying idle. Among the mines that have mills upon them are the Soggs or Old Bunker Hill, the Providence, and the California. All have been worked successfully, but are now idle, as they claim, on account of the high price of labor.

The Stiles Ledge

Is situated within the city limits, and

owned and superintended by W. C. Stiles. It runs north and south and dips to the east; the vein is from ten inches to five feet wide; an incline shaft is down 70 feet; hoisting works at the top, 8-inch pump run by 17-foot water wheel. The character of this rock is a mixture of granite, slate and limestone. It is now paying well, is easily crushed, by an 8-stamp mill, owned by the same party, 1,000 yards distant, and is reached by car. The same machinery that runs this mill runs the manufacturing machinery for making sash, doors, blinds and furniture, also flooring and siding. Every new device necessary for the manufacturing of the above named articles is to be seen here. This is owned by the same party.

Omega etc.

Omega is situated nearly 21 miles north of Nevada City. The principal mines and water privileges here are owned by Messrs. Hinds, Kidd & Tully, Bankers of Nevada City, by whom they are very successfully worked. \$65,000 have lately been cleaned up from a 30-day's run. From here to Washington is three miles by trail. The principal mining here is river mining, and several companies are at work. The Milton Wells Cement mine (with 4-stamp cement mill) is owned and worked by L. Ferren and four others, is situated $\frac{1}{2}$ mile below Washington on the South Yuba, extending into the hill, and is paying well. From here to the Jim mine and through South Fork to Eureka (or Graniteville) is 11 miles up hill by trail. The territory through which you pass is called "God's Country." Its being a hard country to get to, will be my apology for not getting there in this letter. Through grace I hope to get there in my next.

L. P. Mc.

The Burro Mines Again.

EDITOR PRESS: Your article in the Press of the 27th August, in reply to one from me of a former date, has hit this moment come to my notice. The "Authority" from which your information was obtained, is certainly very unreliable. In my opinion, "Authority" was never in that country, his descriptions are very unintelligible indeed; the quotation from the *Bulletin* correspondent is in my mind correct. To "Authority," 1st, the Burro mines may be in the Pyramid Range, but, except distance, the Burro Range is as distinct from the Pyramid Range as the Rocky Mountains from the Alleghanies. Traveling eastward from Tucson, we pass through the Chirachua Range in a pass called "Apache Pass." Here Fort Bowie is situated at an elevation of 3,800 feet (approximate.) We then cross a wide plain, say thirty-five miles, through which, running to the northwest, flows the San Simon, a small stream affording water enough for a watering place. We next come to the Pyramid Range, where is situated Leidersdorff's Wells, and the place is substantially as described by the *Bulletin's* correspondent for the location of Ralston. Passing on from this well, say six miles, stop, if you please, and turn your face to the east. You may now look as far as the eye can see, and you will see nothing but a barren desert; neither mountain, timber nor water to be seen for two hundred miles. Now you face 90 degrees to the northward, and you may look with the same result as before, except that you may see the mountains in the far distance beyond the Gila river. Located within this right angle are the Burro mountains. Twenty miles further you will touch the extreme furthermost point of the Burro Range. From here the range runs North, intersecting the Magallon (pronounced Mozyon) range west of Los Pinos Altos. Fifteen miles north of this place, in the Burro Range is a place called Burro Cienega, where I had heretofore supposed the mines were. The Chirachua and Pyramid are parallel ranges and run northwest and southeast, losing themselves as you approach the Gila on the northwest of Fort Bowie and Leidersdorff's Wells-Saw Mills, (plural number) on the Mimhres, is supremely ridiculous. From this well to the crossing of the Mimhres is about fifty-five miles. The crossing is out on the open, barren plains; not a stick of timber bigger than my leg within fifteen miles, except the cottonwood growth along the banks of the stream, and then only in the direction that in my mind would preclude the building of a saw mill, as it would have to run by steam, as there is not water enough. If any saw mill has been built in that country, it must be in the neighborhood of Fort Bayard, in the Pinos Altos Mining District, thirty-five miles northwest of Camp Mimhres. At the crossing of the Mimhres the stream does not afford running water more than three months in

the year; the balance of the time water is obtained from wells. "Two stage lines run to Ralston, one by Tucson, the other by Santa Fe." From Tucson by way of Ralston to Santa Fe is 600 miles. To say a stage line runs via Santa Fe to Ralston is as meaningless as to say the Panama Steamer runs "via" New York to San Francisco. If the town of Ralston is three miles south of Leidersdorff's Wells then "the stakes of the Southern Pacific Railroad do not run through the town," for it will be up in the mountains; and with a good location for the road at the foot, it is not at all probable that it will run up there. Putting the whole together, I am well satisfied that "Authority" never saw that country. I do not see that the *Bulletin* correspondent calls it the Burro mines. TIMOTHY.

[On the individual points alluded to above, we have nothing to say. Our correspondent is, however, altogether too suspicious. It is possible that he may not have seen everything in that country. Our "Authority" was the discoverer of the mines, letters from various private parties known to us personally or by reputation, and the various country and city papers.

In addition, it may interest Timothy to learn that the *Bulletin* correspondent, whose word he seems more inclined to take, dated his letter from "Burro Mines, Virginia District, Ralston City," says that the mines are accessible, and with very little labor can be made easily approachable for heavily laden wagons; that water is abundant on the surface in the rainy season and some time there-after, and that several wells, from five to twenty-five feet deep, produce excellent water; that wood is known to abound within twenty miles, with ample cedar for firewood, within a few miles, to last for some time; etc. If Timothy had read all the accounts, he would see that the Press has certainly not published palpable "absurdities."—Eds.]

Evanston Coal, Wyoming Territory.

EDITOR PRESS:—Thinking it would interest your readers to know something in relation to the extensive coal mines at this place, and what the Rocky Mountain Coal and Iron Company are doing, and propose to do, I send you a few items kindly furnished by Mr. S. W. French, a prominent member of the company. In the Fall of 1864, a member of the company discovered the mine, but not until 1868 was it opened for commercial purposes; this being about the time the Union Pacific Railroad was completed to this point. About a mile to the west of the station, this company have a branch track something over a mile in length, crossing Bear river and connecting the railroad with their mine. From this branch road Y's have been constructed into the drifts, which are about on a level with the railroad. The hills rise from 300 to 500 feet above the mouth of the tunnel, and it is 200 feet in to where the solid unstratified coal is reached. This extends along the face of the Bear River Mountain, north and south, in nearly a horizontal direction, for about one and a half miles, and varies from 26 to 42 feet in thickness. The average of a number of analyses of this coal, made by P. Frazer Jr., shows: Water, 5.83 per cent; volatile substances, 37.49 per cent; coke (carbon), 49.50 per cent; ash, 7.46 per cent; sulphur, a trace. Total, 100.19. Specific gravity 1.341.

The coal appears to resist the atmosphere much better than, and is not nearly so friable as other tertiary coals, but fractures very much like other coal of this class, conchoidal and irregular, is black, lustre resinous. The croppings have been traced for three miles. The company have entered into an arrangement with the Central Pacific Railroad Company, whereby they are using this coal the whole length of their line. They run their coal trains over the Union Pacific road 75 miles east of the Junction at Ogden. The C. P. R. R. and R. M. Coal Companies have perfected arrangements to commence shipping this coal to San Francisco, where it is to be offered in the market at about \$11 per ton. The mine is opened for 400 tons per day, and can be increased to 1,200 tons.

The iron property is one and a half miles north of the coal bed. This is a mountain of mixed oxide and carbonate of iron; is entirely free from sulphur and phosphorus, and is inexhaustible in quantity; it assays from the surface, 30 to 35 per cent. of metallic iron and 32 per cent.

of carbonate of lime. The company propose to erect in a short time a blast furnace of the capacity of 50 tons per day. The coal is so convenient that the company expect to be able to supply San Francisco and Omaha at a much lower rate than it can be obtained from Ohio or Pennsylvania. MINER, L.

From Utah Territory.

[Written for the Scientific Press.]

Brigham City.

Brigham City is situated a short distance west of Ogden, close to the mountains, on a high bench, some 2 miles from the station. The place is quiet and pleasant, fruit trees having been extensively planted, and streams of water running through the gravelly streets. The population is from 1,500 to 2,000. The buildings are constructed principally of adobe. There is one hotel, one store (conducted by the Zion's Co-operative Institution), a tannery, saw, grist and woolen mills; of the latter, one small one is in operation and one large one being built. There are no saloons. A Tahernacle was commenced some few years ago, but the devastation of the grasshoppers has delayed its construction, and divine service is held in a building made of hushes and limbs of trees in summer, and in the court house in winter.

A large, two-story woolen mill, 84x45, is being built. The first story will be of stone, the second of adobe, the lumber coming from the Wahsatch Mts., and being good for framing and heavy work but not very nice for finishing. There will be here 4 looms and 3 carding machines, the mill having a capacity of working up about 100 lbs. of wool daily. Mr. Alanson Norton, who has been very successful in this business which he appears to understand thoroughly, will have the whole management.

A tannery, 81x26, built of stone and adobe, is situated in the lower part of the town. It contains 16 vats, 2 lime vats, etc.; capacity, 25 hides weekly. The Red Pine bark is found in the mountains near by. To get the whole strength of the bark, they have a large reservoir (8x9x4 feet) below the steaming vat. The water from the 16 vats runs into this reservoir, is then pumped into a heater, and then goes through the leaching vats and the before mentioned 16 vats. This, they say, works excellently. The tannery is managed by A. Hillam and Son. The pump referred to is the well-known American Submerged Pump, made by the Pacific Pump Manufacturing Co. of your city, and is highly praised.

Cache Valley.—General Remarks.

About 28 miles northeast of Brigham City is Cache Valley, nearly 10 miles wide and upwards of 30 miles long, where are situated many small settlements. The largest is Logan City, with 2 large flour mills, saw mills, etc.; among the others may be named Wellsville, Malad City, Hyrum, Millville, Franklin, Providence, Hyde Park, Smithfield and Richmond. The farms are irrigated by streams from the mountains, but the grasshoppers have most seriously injured the crops.

The Mormons are bound to patronize home industries, as you can see by my previous notes, and being very industrious propose to export, rather than import goods. If they keep on in the way they have begun, they will do this. The great trouble they have had of late, one which has seriously injured them, has been the annual invasion of the grasshoppers. They live, however, always in hopes of a better year. The visit this year being early, the fruit trees have not suffered so badly, and many have been able to plant corn after the visit. They have been trying to introduce the cotton and silk culture, and are anxious in many places for information concerning hops.

Corinne.

Corinne, a town of rising importance, is favorably situated on the line of the C. P. R. R., and is the depot for trans-shipment of goods and passengers to Montana and Idaho. It contains some 2,500 inhabitants, has two good hotels, churches, stores, etc. It supports a well-edited daily paper, the *Corinne Reporter*. Near by are thousands of acres which are asserted to need only irrigation to make them productive, and a company has been formed for bringing down water from the Bear River for this purpose.

There are large freight depots here. E. G. Macey & Co. have accommodations for goods for the Montana trade, as have Creighton & Munroe, forwarding and commission merchants. The firm of P. Schutler & Co., wagon makers of Chicago, are doing a flourishing business. I saw several car-loads of the different parts of their wagons, which can readily be put together. They have principally farm wagons. L. Es-penschied & Co., of St. Louis, have a lot of heavy wagons for the teamsters of the Montana trade. I saw some 15 to 20 getting loaded for the upper country. The Oriental Powder Co., of New York, has an agent here, Mr. A. W. Taylor, for the sale of their well known powder and fuse. They have a patent compound for mining purposes; also electric batteries.

Mr. H. House, who owns a saw mill at this place, erected a very large water tank to supply the city. This tank will hold nearly 800 bbls., and is pumped full every evening. The logs for the saw mills are floated down the Bear River for miles and worked up here for building purposes.

But I must shorten my letter, for I am bound to Montana, whence you will hear from me.

W. H. M.

August, 1870.

Mechanical Progress.

CUSHIONED SPIRAL SPRINGS.—The *Engineering*, for September 9th, describes the process of making Thomson's springs for railway buffers and carriage bearings, at Glasgow. We condense: "Rods of fine steel, prepared for this purpose, of about $\frac{3}{4}$ inch diameter, are cut to proper lengths and the ends subjected to a machine which rounds off the corners. The rods are then heated in a furnace of peculiar construction, which imparts a uniform temperature, drawn out at cherry-red heat, and run into a machine which immediately converts them into spirals of great uniformity. These are again heated and subjected to a tempering which produces a spring of great elasticity. They are now submitted to an extreme compressive test. The testing machine is an apparatus somewhat resembling a press, the lower table of which is constantly moving upwards and downwards at fifty strokes per minute. The tester places the spiral on the table when at the lower portion of the stroke; the spring is then suddenly compressed till its coils touch each other; he gives a screw above a slight adjustment until the compression is sufficient to lift the long arm of a weighted lever. We noted that each spiral tested raised a weight equal to 7000 pounds, without breaking or taking any 'set.' Each spring after testing is filled with a core of wool. The quantity of wool for each is accurately weighed, then compressed into the spring by powerful machinery. By this packing a harmony is attained which causes the coils of the spirals to act together, each riding the other. It may be called a column of wool within a yielding cylinder. The quick action of the spiral is modified by the wool, at the same time that the resisting power is more than doubled. The wool thus packed does not chafe in use. As a test, one of these spirals has been placed in a machine, and brought dead home 400,000 times in quick succession, without the slightest deterioration of the wool. The springs when thus finished are ready for being put into a buffer or bearing case. A test of these springs was recently made on one of the continental railways. First an engine buffer containing three spirals, was placed under a hydraulic press and its resisting power found to be upwards of twenty tons; secondly, it was placed in a machine and tested by quickly repeated strokes, for several weeks, after which the springs were examined and found as good as when put in."

A NEW ROTARY PUMP.—*Les Mondes* describes a new pump especially designed for the use of those engaged in wine or beer manufacture. It imitates in its operation the peristaltic movements of the intestines. "Revolving arms, turned by a crank, carry friction rollers, which, in rolling upon an elastic tube, press before them the liquid or gas that it contains, while the tube, regaining its form after the compression, exerts an aspiration proportioned to the elasticity of its sides. The plan is admirably adapted to all the requirements of storing or transporting wines. The wine traverses the pump without shock; an important consideration. It passes over as in a siphon."

POWER TRANSMITTED BY BELTS.—Experience demonstrated to M. Laborde that a belt $3\frac{1}{4}$ inches wide, running 533 feet per minute, transmitted one horse power of 33,000 foot-pounds, having the usual tension, and without deforming itself, when the pulleys are smooth-faced and of equal diameter, in order that the belt may embrace their semi-circumference. This is equivalent to 144.35 square feet of belt per minute per horse-power, and 19 pounds strain per inch of width. M. Carillon employs a rule based upon the following:—"A belt can transmit 1 H.P., if it have a surface velocity of 96.9 square feet per minute, providing not less than one-third of the circumference of either pulley be embraced." *Journal of Frank. Institute.*

ISOMETRICAL DRAWING.—An English draftsman has devised a drawing-board—in the form of an equilateral triangle, for isometrical drawing. An ordinary T square applied on the edges, draws tangents that meet each other at angles of 120° , and other lines drawn parallel to these radiating ones form with them angles of 60° and 120° , which are the exact angles of the apparent squares of isometrical cubes.

LOCOMOTIVE BUILDING.—Wm. S. Huntington has an article in the *Chicago Railroad Gazette* on "The Locomotive practically considered,"—from which we copy the following: "The manner in which a locomotive tire is bolted on in some shops is wonderful. The holes are drilled with a slant, so as to bring the nut to one side of the centre of the rim, thus leaving no bearing for the nut except on one corner. Sometimes no nut is used, the bolt being riveted, and the bolts are not countersunk, or tapered (which is preferable.) Tires frequently become loose in a short time after being put in use, or if the tire remains fast the bolt becomes loose, when it is necessary to taper the holes, make new bolts to fit them, and chip away the casting on the inner side of the rim to form a seat for the nut. These bolts should be tapered $2\frac{1}{2}$ or 3 inches, nicely turned to a true fit and driven home with moderate blows of the sledge, (not hard enough to strain the tire.) A nut should be screwed on a well fitted seat, and the bolt well riveted on the nut."

The writer adds in a note:—"Some mechanics prefer to fasten tire with set screws from the inner sides of the rim. The plan of bolting through the tire is not satisfactory in all respects, especially as it greatly reduces the strength of tire; but it appears to be the best plan yet devised, all things considered."

A SUSPENDED TUNNEL IN THE BOSPHORUS.—There is an immense traffic from the Stamboul to the Pera side of the Bosphorus. The existing bridges of boats are barely large enough for passengers. The very great depth of the water, the precipitous banks, and the 30 feet of mud which forms the bottom, forbid tunneling in the ordinary way. One of the chief engineers of the Turkish Government (Mr. Hadden) proposes to suspend or float a tunnel, at 35 feet below the surface, allowing passage to vessels of the largest tonnage. There is no tide in the Golden Horn. The tunnel would consist of a wrought iron tube, 10 feet in diameter, and 1,200 feet long. The tube will weigh 600 tons; maximum weight of any train 400 tons; concrete and lining, to overcome the buoyancy of the tube, 1,700 tons; water displacement, 2,700 tons. When the tunnel is not in use, there will be an upward strain of 400 tons, which is to be neutralized by holding-down chains. *The Engineer.*

INTERMITTENT ELECTRIC LIGHTS.—M. Delaurier has taken up the proposal of M. Lucas, a Government engineer, to obtain a very powerful electric light for coast service, at a comparatively small cost, by making the light intermittent, with intervals of two seconds; by this means, it is said, one ten-thousandth part of the electricity expended for a constant light will suffice. M. Delaurier suggests the following arrangement: A battery which is only in action when the circuit is open, with couples united together in masses, and the electricity passed through coils of solid iron wire; a very long copper wire, covered with silk, is wound around the iron coil, the copper being sufficiently thick not to be heated by the passage of the current. Each pole is provided with a charcoal point; when these are in contact the current passes, and when they are separated the sparks are excessively brilliant, because both the direct and the extra current are brought into action. A simple arrangement of clockwork causes the points to come into contact every two seconds, and then separates them sharply, so as to break the current instantaneously.

THE GREAT STEEL BRIDGE AT ST. LOUIS.—This is to be 2230 feet in length, and will cost about four and a half millions of dollars. The four piers will carry three arches, the central one being of 525 feet span. The *Iron Age* says:—"The best cast steel is selected as the material of these arches. Each of them will be double—that is, consisting of two concentric arches, twelve feet apart—and joined together by a network of massive steel braces. These double arches will be stretched parallel with each other, four in each span from pier to pier. Upon them there will be laid the upper structure of the bridge, in two stories, the lower of which is exclusively for railroads, and the upper for vehicles and foot passengers. Being fifty feet wide, both will afford ample accommodations for all the traffic that will cross the bridge. The structure will present no obstruction to the free navigation of the river, as the largest steamers may pass under it without difficulty."

Scientific Progress.

MOUNT HOOD.—Prof. Collier, of Pacific University sends the *Portland Oregonian* an account of the ascent recently made by himself and Prof. Powell of Salem. We quote a paragraph or two:—"Mt. Hood is an old volcano. Its eruptions were probably not liquid lavas but volcanic ashes, now in part hardened into tufa or baked into porphyry. Its old crater was what is now the summit and was from a quarter to a half a mile in diameter. This old crater was more than 500 feet deep. Its rim to the north and east still stands, but most of the southern and western portion is gone. Of the southern portion of the rim there remains a single pier of rock several hundred feet wide and very high. To the southwest a similar pier of basaltic rock, standing upon stratified rock, has slid part way down the side of the mountain. The Deschute heads in a glacier extending from the southeast of this crater, and the Sandy has a similar origin to the southwest. Both these streams run white all summer with volcanic ashes. From very many places in this old crater there issues hot sulphurous vapor in varying quantities. * * A mean of observations taken at the summit, 'gives for the height of the mercurial column, reduced to what it would have been at the freezing point of water, 20,000 inches. The mean air temperature was for the same time 42.5° F. These and similar data furnished by Mr. Wilson, of Astoria, give for the height of Mt. Hood 11,218 feet. Three years ago Col. Williamson made the altitude 11,225 feet. This is a much closer agreement than I had expected. Using observations made for me at Portland and Forest Grove the altitude is a few feet greater. I feel confident that either of these measurements does not involve an error of 100 feet."

GAIZE.—The substance known as gaize, or *Pierre morte*, is a mineral largely met with in the department of the Ardennes, where it forms a deposit of some 100 metres' thickness. Its sp. gr. is 1.48, and it consists, in 100 parts of—Soluble silica, 44.8; insoluble silica, 42.0; alumina, 5.1; peroxide of iron 2.5; lime, a trace; hygroscopic and combined water, together, 5.4. It is, on being dug up, quite soft, so that it can be cut with a knife, but becomes hard on drying, and very hard when exposed to red-heat, whereby its specific gravity is reduced to 1.44. This material is essentially a substance capable of withstanding high temperatures; and the author exhibits crucibles made from the gaize, which have been used successfully for melting iron. *Chemical News.*

FOSSILS IN MINERAL VEINS.—A paper by Chas. Moore, in the *British Association Reports* for 1869, notes numerous fossils in the lead mines of the carboniferous limestone of Great Britain, and thus remarks upon the origin of the veins:—"The chief material of all the mineral veins I find to be of marine origin; all the organic contents are fossil, and their precise geological age can be arrived at without much difficulty. Wherever they contain land shells, as on the Mendips, or freshwater shells, which occur in the veins of Alston, and are wide-spread elsewhere, they are also fossil and of contemporaneous age with the other remains. It is certain from this that the veins received their infilling when within the influence of the ocean, and before their present elevation, since which time, as I have before stated, I doubt if there could be any material alteration in their contents."

PREPARATION OF IODINE.—"The process for separating the iodine from the seaweed ashes, is very simple. The ashes are leached with water, and the various crystallizable salts of potash and soda are separated by concentration. Carbonates, sulphates, and chlorides of potash and soda are thus removed, leaving in solution sulphite, hyposulphite, and some carbonate of soda, together with the iodides and bromides. By the addition of sulphuric acid the first three salts are decomposed, and the sulphate of soda produced is removed by crystallization. The concentrated mother-liquor is acidulated with sulphuric acid, and after the addition of biniodide of manganese, the iodine and bromine distilled off."—*W. H. Chandler in Am. Chemist.*

DECIMAL MEASUREMENT OF ANGLES.—M. Villarcieu proposes to divide the circle into tenths, hundredths, and thousandths, instead of, as now, into 360 degrees. The word *tour* (turn, circumference, once around) is suggested as the unit, and its initial letter *t* as its symbol. He further proposes the same method of division in time; taking the day as the unit, and dividing it into tenths, hundredths, etc.

SOURCE OF PENNSYLVANIA PETROLEUM.—"With Drs. Newberry's leaning to the hypothesis that the Pennsylvania petroleum is a distillation, or exhalation, from the black shale formation which lies deep below the Venango county sandstones, we cannot sympathize. For why then are not the Western counties of Indiana good oil fields? If, on the other hand, we keep to the opinion that the fossil plants of the Venango sandstones themselves furnished the oil, it is easy to find a cause for the absence of the oil in Indiana in the scarcity of fossil plants, whether we explain this scarcity by distance from the Ancient Paleozoic Appalachian sea shore or in any other way. We object equally to Professor Hall's method of accounting for the absence of petroleum reservoirs in New York State. All the facts known seem to us to show that the 'anticlinal axis theory,' is quite false. In Pennsylvania and Virginia, the country which is traversed by anticlinal axes has never yielded much if any oil. On the contrary, the rich oil region of the Alleghany river, the oil region of southeastern Ohio, and most of the oil regions of the Kanawha, Gnyandotte and Sandy, are almost undisturbed; with rocks so nearly horizontal that the nicest instruments cannot measure the local dip. The oil-filled fissures cannot be ascribed to wave movements in the crust; they must be mere shrinking cracks."—*U. S. Mining Register.*

THE AIR OF IRON FACTORIES.—The following is from the *Bowdoin Scientific Review*: "Dr. George Sigerson, of Ireland, has published several interesting papers upon the microscopic examination of 'special atmospheres.' In iron factory air, Dr. S., found a black, friable dust, made up of particles of carbon, of ash and of iron. The carbon formed the largest masses, the ash-particles were reddish, or white and opaque. Some transparent pieces with a glassy fracture were noticed, and regarded as glass resulting from the fusion of sand used in the welding process. An extremely fine powder, the dust of the dust, was carefully examined for germs or spores, but it presented angular shapes and colors identical with other matters. The particles varied in size from the one five-hundred-thousandth to the one fifty-thousandth of an inch. The iron was present in the form of balls, hollow and with walls so thin that when broken they appeared translucent. These microscopic bombs were sixteen times greater in their diameter than the thickness of the shell composing them, so that the conclusion is reached that iron is translucent when it attains a tenuity of one thirty-thousandth of an inch. It will be remembered that gold-leaf one two-hundred-thousandth of an inch in thickness is said to transmit light of a dull greenish color. But among all the dust examined, no germs or spores were found, in fact no fibres save a few cotton filaments from the garments of the workmen, fibrous carbon particles and a specimen of branching metal."

PREPARATION OF SPIRITS FROM LICHENS.—Dr. Stalschmidt says that the large quantities of lichens found in many parts of Europe may be applied in this manner, and thus a saving effected in the consumption of grain. The author describes the process at length; the cellulose of the lichens or moss is converted into glucose by boiling with from 7 to 10 per cent. of the mass of hydrochloric acid (sp. gr. 1.165) by the aid of steam; the acid is saturated with chalk, and the saccharine matter brought to fermentation; 20 pounds of moss or lichen yield five litres of spirit at 50 per cent. anhydrous alcohol. *Chemical News.*

THEORY OF THE BUNSEN FLAME.—"The non-luminosity of the flame of the Bunsen gas-burner is commonly ascribed to the more complete combustion of the gas by the air which is mixed with it before it is burned. But this is an assumption entirely unproved as yet; and moreover, the positive experiments of KNAPP show that this cannot be the only cause of the phenomenon. His burner was so constructed that by means of a lateral tube, other gases beside air could be mixed with the coal-gas; and the results obtained prove that nitrogen, hydrochloric acid, or carbon dioxide gas causes the flame to burn fully as blue as is seen in the burner as ordinarily used. Knapp believes that the disappearance of the luminosity is due partly to the cooling of the flame, but principally to the dilution of the illuminating gas; and that the flame of the Bunsen burner is non-luminous from the same cause which lessens the light of a candle burned in vacuo, or at high altitudes."

AGRICULTURAL DEPARTMENT.

New Trees for California Culture.

There is a tree quite common in some parts of Spain, known as the "Carob Tree," the pods of which, when ripe contains a few drops of a substance somewhat resembling honey. It blooms twice a year—at the end of January or the first of February, and about the middle of September—and when well watered, grows to a considerable height and size, sometimes spreading to such a degree as to have a circumference of two or three hundred feet, and bearing upwards of a ton of pods. Young trees, only a year old, often have stems eight or ten inches thick, with branches ten or twelve feet long. Cattle, horses and mules devour the pods with great avidity, and if well fed upon them will become extremely fat, or in good condition to work. This tree will doubtless succeed well in many parts of California, and might possibly prove of considerable value. Attention was first called to it with the view of its introduction into the middle States. It flourishes extensively near Alicante, in Spain, and grows readily from the seed.

The Cinchona (Peruvian Bark) Tree.

The attention of the Kern County Agricultural Society has been directed to the matter of raising cinchona trees in that locality, and the Secretary, A. D. JONES has addressed a letter to Mr. CAPRON, Commissioner of Agriculture, asking his views and recommendations on the subject. He replies rather favorably towards making the experiment, and it is quite probable that some practical steps will be taken in the matter before long. Small plantations should also be set out at various other localities in the State.

There is no substitute, in the *materia medica* for the bark of this tree, the entire supply of which now comes from South America, where, owing to the reckless folly of the natives in girdling and cutting down the trees, their early and total destruction is feared. The American Medical Association has also memorialized Congress on the subject of introducing the tree into cultivation in the Atlantic States.

The memorial shows that in a period of six years, from 1865 to 1869, 1,641,876 pounds of the bark of the cinchona tree were imported into the United States, for which we paid \$1,874,112. Experience has demonstrated that this tree can be safely transplanted, England having set out a plantation of cuttings in India with complete success. Some parts of California, more particularly San Luis Obispo and San Diego counties, are believed to be well adapted to the growth of the cinchona. The American Medical Association request Congress to appoint a commission of scientific men for the purpose of taking the necessary steps for the cultivation of the tree in the United States. The Sacramento Medical Society has pledged itself to use every effort to find a proper locality for the cinchona in California.

LARGE SWEET POTATOES.—A sweet potato has been raised on the ranch of Brokas & Perkins, on the Sacramento, which is thought to be the largest ever produced. It weighs 6½ pounds and measures 12 inches in length by 18 in circumference at its largest girth.

SHEEP IN LOS ANGELES.—There are at present 447,060 sheep in Los Angeles county, the annual yield of wool from which is estimated at 12,250 pounds (6,125 tons), an average of 2½ pounds to each sheep.

FARMING PROFITS.—The *Overland* for October makes an exhibit of the average profits of farming in the Pajaro Valley, Monterey county, for the past five years, from which it appears that wheat has paid \$7 10 per acre, flax \$24 55, potatoes 46 12½, beans 19 45. Here it will be seen that all crops mentioned paid better than wheat, three to six times as much, yet the multitude will stick wheat in the ground all the time to impoverish the soil and themselves! When will people learn wisdom?

Stockton Vineyard and Nursery of West Brothers.

While attending the fair at Stockton, we improved an invitation to visit the nursery and vineyard of the West Brothers. These gentlemen settled where they are now living in 1852. Their ranch is a good one and well improved. The soil is of light and heavy adobe "in streaks." Their 50 acres of vineyard are upon both qualities of soil, and they state that there is no perceptible difference in the production or quality of the grapes. For productiveness, size, beauty and flavor, their grapes are not surpassed.

Their System of Culture.

Their system of training is the common low bush of this State. The cultivation is shallow plowing; but thorough, to kill all weeds, and leave the surface loose. They think that deep plowing among the roots is injurious.

They never summer prune at all, but give vines the advantage of a full spread of leaves to the sun. The fruit is finer and better matured than when deprived of leaf-shelter and vitality.

Sulphuring.

The vines and fruit are treated with sulphur thoroughly, twice, once as the blossoms fall and again when the grape is half grown. The sulphur insures the grape against mildew, and also increases the yield more than enough to pay the expense. They use about 100 lbs. of sulphur to the acre every season—dusting it on from a small, coarse bag.

Prolific Yield.

Last year, from three acres (about 1,800 vines, of California or Mission grapes,) they sent to market 1,105 boxes. The vines were 10 years old. Their Black Prince vines, 9 years old, yielded, at 10 cents per lb., the price last year, \$1,600 per acre.

The occasional tempered winds from the sea, and the interior valley sun and heat, appears to be just adapted to the perfect growth and richness of the grape in San Joaquin county. The West Brothers received a special premium of \$30.00 for the extra quality of grapes exhibited by them at the Mechanics' Horticultural Fair in this city. They made a larger display in Stockton—showing some 20 varieties.

Special Varieties.

The varieties that do the best with them are:—Black Prince or Rose of Peru, which they say are identically the same—the Rein de Nice or Flame Tokay; Black Hamburg; Zinfidel; White Syrian; Malaga; Black Morocco and Mission grape. They refer to the White Frontignan, Bissling and Zinfidel as very choice for wine, and remarkably fine with them. The Syrian and Black Morocco arrive at great size and perfection with them, ripening fully. The Purple Damascus and the Muscat of Alexander do not succeed here in fertilizing or "setting" as well as in some other places. These varieties appear to do the best in the driest and hottest localities.

A Worthless Variety.

The Fiher Zagos is a miserable thing. Mr. Henry Lewis, of San Joaquin county, planted 10 acres of cuttings, four years ago, which he obtained direct from Mr. Baghy. His vineyard is planted on the best of soil, but is worthless. He exhibited some of his Fiher Zagos at the fair in Stockton. They rotted in two days, although freshly gathered.

Mr. West's Nursery.

W. B. West, one of the Brothers, has a fine nursery of fruit and ornamental trees, shrubs, and green-house plants. This he keeps under a good state of cultivation, and irrigates plentifully, giving his trees a vigorous growth. In his well assorted nursery he has several thousand nut trees started. He considers the Elm the best shade timber tree for adobe soils—the loudest in a few years becomes stunted and dies.

Oranges and Lemons.

He expresses great faith in the success of orange and lemon culture. He has a fine lot growing in nursery rows which appear to flourish better in the open sun and air, than under a half shade and shelter. He says they will endure the frost also. He has obtained a few hardy varieties of oranges from the East, among which are the *Zangerine*, *Maltese Blond*, *Sweet Sicily*, *St. Michael* and *Mandaren*; also a large lemon. These he will propagate from.

We are glad to notice among nurserymen, all over the State, a growing interest as to the importance of timber, nut and orange planting. Now that they lead in example, success will surely follow.

The San Jose Fair.

The first annual exhibition of the Santa Clara Agricultural Society opened on Tuesday last.

The New and Magnificent Hall in which the exhibition is held was well filled and tastefully decorated. This hall is (we believe we are authorized in saying it) the handsomest on the coast. It is the property of S. M. Smith of San Francisco and was designed by S. C. Bugbee & Sons. The whole building is exceedingly neat and well arranged, but of this we have not time to speak now. Stating merely that it contains fine rooms, ample corridors and will be fitted up in the best style, that the rear part of the second floor is devoted to halls and their connections, and that a lecture room, 30x60 feet adjoins the main hall, we give the *Independent's* description of the one in question.

The Music Hall is 60x83 feet and 25 feet high, with ample entrances from the wide corridors. It has a carved ceiling with moulded beams above, and a fine cornice 20 feet from the floor, supported on pilasters with enriched panels; on each of these is a gas bracket. At the north end, between the two halls, is a fine stage, 25x42 feet; on each side are fluted Corinthian columns and pilasters, ornamented doorways, to ante-rooms and boxes above. By removal of the stage, which is built in sections, the two halls can be thrown into one, having a length of 134 feet. Attached to the hall are dressing rooms for ladies and gentlemen; thus every convenience has been provided to make these rooms desirable for parties; in case of a grand hall the larger one would be unsurpassed for that purpose, and the smaller one he used for a supper room. The stage will be fitted up for musical and dramatic entertainments. Scenery will be provided, and a splendid drop curtain, with foot-lights, etc. Every attention has been paid to lighting and ventilation. On the rear, at each end, an additional exit has been provided to the yards below.

The halls and corridors are wainscotted with alternate strips of pine and redwood, varnished, showing the natural grain of the wood. The ceilings and walls of both halls are frescoed. The principal ceiling will be very beautifully set off in panels; midway of the space is a large dome, in the center of which is a fine open ventilating centerpiece, from which is suspended an 18-light chandelier; in the dome are bronze medallions of Shakespeare, Dante, Milton, etc. The walls of the large hall are not yet completed, but on either side of the proscenium will be an allegorical figure representing Music and the Drama. The capitals and other ornamentations will be white, tipped with gold, and the effect of the whole when completely will be very rich.

This ample hall is divided off into appropriate departments, the center being devoted to the exhibition of fruits, flowers and shrubs, a large number of the latter being tastefully arranged in the form of two fine pyramids. Three tables, six feet in width running parallel to each other nearly the full length of the floor, fairly groan beneath the weight of fruits of every variety, from the "Gloria Mundi" apple to the delicious raisin grape, black Hamburg and Morocos and the finely tinted muscat of Alexandria.

There were on Thursday morning nine exhibitors of fruits, making a very fine showing. The season is now more timely for maturity and colour of fruit than at

the late fair in this city, so that the same exhibitors make a much better display.

We are in receipt of a lengthy communication from our special correspondent, with regard to this exhibit, which we are compelled to defer until next week.

The Upper Sacramento Fair at Chico.

The Upper Sacramento Fair opened at Chico on Tuesday of last week. This is one of the finest agricultural regions in the State, and the display was excellent. The show was not very large; but it was numerous and suggestive in kind.

The chief feature and glory of the exhibition was the show of stock, which, it is claimed, has not been excelled anywhere on the Pacific Coast. Marvels of fruit and vegetables were to be seen; and the products of the dairy also formed a very suggestive feature. Gen. John Bidwell made a very excellent display of fruit and stock.

The *Bulletin* correspondent speaking of the Fair as an entirety says:—"It was one of the honestest little Fairs I have seen of late. * * * Out in the Pavilion, rude and unsightly as it is, with plenty of cracks between the boards, there were tables laden with honest pumpkins and apples, and the rough unplanned walls were hung around with the works of noble, old-time matrons, and there were savory, dried peaches, and rolls of yellow butter, and a creditable exhibit of wheat and sacks of Graham flour; and above all things, there was no civilized padding and stuffing of merchandise, and the damnable nostrums of quacks. Never in all my travels, either among the fruit-stands of New Orleans, or beside the booths of *Bella Napoli*, have I stood among a collection of fruit so richly, so flagrantly aromatic, as here in this rude pavilion. It was remarkable. I could not have believed that a hundred miles north of Sacramento would have caused such an improvement in the aroma. The show of fruit was not large, but it was wonderfully savory to the nostrils. But, far better than all beside, were the manly bronzed farmers, (in the pavilion rather than in the park) and their homely-clad but rosy dames and maidens. The number of farmers wearing membership badges was notable. The society pays off a debt of about \$2,500 this year."

The Sonoma and Marin District Fair.

The pomological exhibition at this Fair which opened on Monday, is pronounced by good judges one of the finest which has been held this year; mammoth pumpkins, squashes and other vegetables were also well represented. Its domestic character was also especially notable. The exhibition of such articles as tend to the building up of comfortable homes and homely virtues were particularly suggestive of our early eastern fairs. Dairy products were represented here in creditable shape and quantity. Rolls of butter were exhibited which stood erect in the torrid heat of that locality, and unyielding as pillars of salt. The cheeses, one of which weighed 240 pounds, looked remarkably well.

The show of horses was very good, thoroughbred, and mixed, light roadsters, and of those heavy draft. One of the cattle, a Clydesdale weighs 2,190 pounds. There was also a fine show of Durhams, French, mixed, and others, bulls, cows and calves. Of sheep, the show was small, chiefly Cotswold and South-downs.

THE FAIR SEASON.—Mr. Greeley's "What I know of Farming," No. 38, which appears in our issue to-day, is especially opportune at this season of agricultural fairs. We commend its perusal to all managers of fairs, and to all who visit them. The hints therein given are well worth bearing in mind.

COPPER ORE FROM SAN MATEO COUNTY.—We saw at Howland's mill, this week, about ten tons of copper ore from San Mateo county. The exact locality was not given, but we are told that the mine is worked by Spaniards and that five or even ten tons can be shipped daily. The ore is said to hold some gold.

The Sacramento Beet Sugar Works.

Having read and heard much about the Sacramento Sugar Beet Factory, we took a stroll out to the works, while in attendance at the State Fair. The mill is about 2½ miles east of town, within and near the levee; while the largest portion of the 360 acres, owned by this company, is on the outside, and subject to overflows during the rainy season.

From information we had received, we were expecting to find a much more extensive and complete establishment. The building, which is of wood, and one story high, is of plain construction and apparently new. A new set of machinery has been procured, and is being set up while the old set has been carefully removed. Booth & Co., of San Francisco, who manufactured the machinery for the Alvarado mill, made this new set.

Machinery.

The engine is a 35-horse power while the boilers are large enough to supply steam for boiling and heating purposes also. They have a large washing machine where the beets will be cleaned from all dirt. The beets will be converted into pulp in a large grater, of the same size as that at the Alvarado mill, and two centrifugals, 32 inches in diameter, will be used both for extracting the juice from the pulp, and the syrup from the crystallized sugar.

From the centrifugals, the juice will run into large receivers where it will be brought to a boiling heat, and then taken by "montejuces" to the defecation pans, which are elevated to near the roof. From thence the juice will pass through leading pipes into flannel bags filled with bone charcoal, where it will be filtered, run into a receiving pan, and returned to the montejuces to be again elevated, this time, into the clarifying pans. From there, it will, by force of pressure run through two large boiler-iron filters into an evaporating pan, and then into the concentrating pan, and on again into the coolers. There are six coolers in a tight room, which will be kept at 110 degrees of heat. Here the crystallization takes place, after which the sugar is separated from the syrup in the centrifugals. It is then ready for market.

In all the several sets of pans through which the juice runs and is made to flow and settle, there are coils of steam pipe to keep the temperature at the desired degree. And there are many little particulars of workings, of material importance, not mentioned, but requiring skill and attention. It is stated that only fourteen men will be required to run this mill day and night, which will consume about 50 tons of beets per each 24 hours, and produce some four tons of sugar.

The present works appear to be constructed with an eye to rigid economy. The whole machinery cost about \$6,500, and while utility is not overlooked, there is no expense incurred for show or unnecessary convenience, either in the building or setting up the machinery.

The ranch outside of the levee is only partly reclaimed from willows, etc. There are perhaps 20 acres of beets growing, one-half of which look very well. The soil will produce good beets or almost anything else if brought under good cultivation.

A. M. O. de Gamout, an intelligent Frenchman, the present superintendent, professes to have had many years experience in the growing and manufacture of sugars, in France, India, and Australia. He anticipates no difficulty whatever, and says the beets here are remarkably fine and rich in saccharine matter. He has cleared about 75 acres from brush, leaving a few narrow strips of trees to break off the winds, and act as a shelter to the fields.

He informed us that he designed cultivating strips or belts of trees all around, and some across the land, for a shelter against winds, against the rush of water,

in overflows, and for wood and timber. He thinks it economy in every respect. We believe this step a good one, and one that might be adopted by our farmers generally with profit, and with good results.

The SCIENTIFIC PRESS has advocated this idea, not a new one, often. Of the varieties best adapted to different localities and soils, we have spoken before, and design to speak further.

The gentlemen who are stockholders in this enterprise are determined to succeed. They have already expended a good deal of money in experimenting.

Beet sugar is no experiment in Europe, where over 2,000 factories are established for its manufacture. This product there, in some sections, has driven all imported sugar from the market, and is in turn exported.

We have every reason to have faith in the success, and eventual importance of the enterprise on this coast, and we are very much gratified to see the spirit and energy exhibited that must overcome every obstacle to final success.

COTTON GROWING.—We have an interesting letter on hand on the subject of Cotton Growing in California, which will appear next week.

THE DRAUGHT OF PLOWS.—The experiments at the plowing trials under direction of the New York Agricultural Society, seemed to prove that the draught of ploughs was very little affected by different degrees of speed. This would show that a fast walking team does not work at much disadvantage.

RASPBERRIES BEARING TWICE UPON THE SAME WOOD.—It may not be generally known that there are varieties of the raspberry which give a crop of fruit twice upon the same wood. The Belle de Fontenoy, Lum's Yellow Canada, and several others yield fruit on the canes of the previous year, which ripens at the usual raspberry season, in the spring. These varieties also yield another crop of fruit, late in the fall, upon canes which have grown during the summer—the same canes which produce the next spring's crop.

CRANBERRIES ON UPLAND AGAIN.—In farther support of what we said a few weeks since about the possibility and profit of cultivating cranberries on upland, we clip the following communication found in a late issue of the *Journal of Agriculture*:—

Three or four years ago I transplanted cranberry vines from my meadow to one of my gardens, which is pine plain land. They have grown well, and they are now loaded with fruit. I had compromised with them; that if they would come and live with me on my land, I would bring them their native soil, so that they would not suffer by emigration. I dug channels two feet wide, twenty inches deep, and three feet apart. I removed the gravel, and filled the channels with muck from whence they were to be taken. I took up the cranberry plants, in small clusters, and set them deep in their natural element. They appeared to be perfectly contented with their new locality. They now occupy one square rod of ground, and they are beginning to enlarge their borders. I keep this patch clear of weeds. The expense of this cranberry square rod was about two days' labor of one man, and one day's labor of one horse. The prospect now is, that the cranberries will yearly pay expenses of their new settlement. Muck and experiments well directed, will prove successful.

HOW TO REMOVE WHITE SPOTS FROM FURNITURE.—Rub the spot with pulverized pumice stone wet with water, and then with buckskin moistened with sweet oil; or, put a piece of paper on the spot, and hold a warm iron over it, and rub with an oiled cloth.

VELVET.—The first velvet factory in the United States has been started by a French colony at Franklin, Kansas. The colony began operations last summer on the co-operative principle, and have already, besides their factory, dwelling-houses, stores, shops, and farms in excellent state of cultivation.

What I Know of Farming—38.

Agricultural Exhibitions.

I must have attended not less than fifty State or county Fairs for the exhibition (mainly) of Agricultural machines and products. From all these, I should have learned something, and presume I did; but I cannot now say what. Hence, I conclude that these Fairs are not what they might and should be. In other words, they should be improved. But how?

As the people compose much the largest and best part of these shows, the reform must begin with them. Two-thirds of them go to a Fair with no desire to learn therefrom—no belief that they there can be taught anything. Of course, not seeking, they do not find. If they could realize that a Farmer's Fair might and should teach farmers something that would serve them in their vocation, a great point would be gained. But they go in quest of entertainment, and find this mainly in horse racing. Of all human opportunities for instruction in humility and self-depreciation, the average public speaker's is the best. He hurries to a place where he has been told that his presence and utterance are earnestly and generally desired, perhaps to find that his invitation came from an insignificant and odious handful, who had some private axe to grind so repugnant to the great majority that they refuse to countenance the procedure, no matter how great the temptation. Even where there is no such feud, many have satiated their curiosity by a long stare at him, walk whistling off, without waiting or wishing to hear him. But the speaker at a Fair must compete with a thousand counter-attractions, the least of them far more popular and winning than he can hope to be. He is heard, so far as he is heard at all, in the presence of, and in competition with all the hellowing bulls, braying jacks, and squealing stallions in the country; if he holds, nevertheless, a quarter of the crowd, he does well; but let two jockeys start a huggy-race around the convenient track, and the last auditor shuts his ears and runs off to enjoy the spectacle. Decidedly, I insist that a Fair-ground is poorly adapted to the diffusion of Agricultural knowledge—that the people present, acquire very little information there, even when they get all they want.

What is Needed to Render our Annual Fairs More Instructive.

I. Each farmer in the county or township should hold himself bound to make some contribution thereto, if only a good hill of corn, a peck of potatoes, a bunch of grapes, a squash, a melon, let him send that. If he can send all of these, so much the better. There is very rarely a thrifty farmer who could not add to the attractions and merits of a Fair, if he would try.

If he could send a coop of superior fowls, a likely calf, or a first-rate cow, better yet; but nine-tenths of our farmers regard a Fair as something wherewith they have nothing to do, except as spectators. When it is half over, they lounge into it with hands in their pockets, stare about for an hour, and go home protesting that they could beat nearly everything they saw there. Then why did they not try? How can we have good Fairs, if those who might make the best display of products save themselves the trouble by not making any? The average meagerness of our Fairs, so generally and justly complained of, is not the fault of those who sent what they had; but of those who, having better, were too lazy to send anything. Until this is radically changed, and the blame fastened on those who might have contributed, but did not, our Fairs cannot help being generally meagre and poor.

II. It seems to me that there is great need of an interesting and faithful running commentary on the various articles exhibited. A competent person should be employed to give an hour's off-hand talk on the cattle and horses on hand, explaining the diverse merits and faults of the several breeds there exhibited, and of the representatives of those breeds there present. If any are peculiarly adapted to the locality, let that fact be duly set forth, with the simple object of enabling the farmers to breed more intelligently and more profitably. Then let the implements and machinery on exhibition be likewise explained and discussed, and let their superiority in whatever respect to those they have superseded or are designed to supersede, be clearly pointed out. So, if there be any new grain, vegetable, or fruit, on the tables, let it be made the subject of capable and thoroughly impartial discussion, before such only as choose to listen, and without putting the mere sight-seers to grave inconvenience. A lecture-room should always be attached to a Fair-ground, yet so

secluded as to shut out the noise inseparable from a crowded exhibition. Here meetings should be held each evening, for general discussion; every one being encouraged to state concisely the impressions made on him, and the improvements suggested to him, by what he had seen. Do let us try to reflect and consider more at these gatherings, even though at the cost of seeing less.

III. The well supported Agricultural Society of a rich and populous county must be able, or should be able to give two or three liberal premiums for general proficiency in farming. If \$100 could be proffered to the owner or manager of the best tilled farm in the county, \$50 to the owner of the best orchard, and \$50 to the boy under 18 years of age, who grew the best acre of corn or roots that year, I am confident that an impulse would thereby be given to agricultural progress. Our premiums are too numerous and too petty, because so few are willing to contribute with no expectation of personal benefit or distinction. If we had the right spirit aroused, we might dispense with most of our petty premiums, or replace them with medals of no great cost, and devote the money thus saved to higher and nobler ends.

IV. Much of the speaking at Fairs seems to me insulting to the intelligence of the farmers present, who are grossly flattered and eulogized, when they often need to be admonished and incited to mend their ways. What use or sense can there be in a lawyer, doctor, broker, or editor, talking to a crowd of farmers as if they were the most favored of mortals and their life was the noblest and happiest known to mankind? What it might be and may yet become, we all know that the average farmer's life is not what it is thus represented; for, if it were, thousands would be rushing into it where barely hundreds left it; whereas we all see that the fact is quite otherwise. No good can result from such insincere and extravagant praises of a calling which so few freely choose, and so many gladly shun. Grant that the farmer ought to be the most enviable and envied vocation, we know that in fact it is not; and agreeing that it should be, the business in hand is to make it so. There must be obstacles to surmount, mistakes to set right, impediments to overcome, before farming can be in all respects the idolized pursuit which poets are so ready to proclaim it and orators so delight to represent it. Let us struggle to make it all that fancy has ever painted it; but, so long as it is not, let us respect undeniable facts, and characterize it exactly as it is.

V. If our counties were thoroughly canvassed by township committees, and each tiller of the soil asked to pledge himself in writing to exhibit something at the next County Fair, we should soon witness a decided improvement. Many would be incited to attend who now stay away; while the very general complaint that there is nothing worth coming to see would be heard no more. As yet, a majority of farmers regard the fair much as they do a circus or traveling menagerie, taking no interest except as it may afford them entertainment for the passing hour. We must change this essentially; and the first step is to induce, by concerted solicitation, at least half the farmers in the county to pledge themselves each to exhibit something at the next annual Fair.—*Horace Greeley.*

THE LEAF THE GOVERNING ORGAN IN VEGETATION.—The leaf-bud of any root of tree or plant, if grafted or budded into another of the same family will produce the leaf of that variety, and it is a settled fact with nurserymen that the leaf gives and governs the peculiar quality and flavor of every fruit. The vitality and strength of stock, and the flavor of the sap also, make a difference in the size and excellence of fruit, but the peculiar nature of fruit is governed by the vital apparatus and principles of the leaf.

Hybridising is accomplished by mixing the sorts by fertilizing the stigma of the flower of one kind with a pollen from the anthers of another variety. The blossoms to be operated upon are usually confined in a wire or gauze netting, so as to preclude all insects that might interfere with the process. The seeds produced are then planted. The plant that grows therefrom is the new variety. In this way of crossing or hybridising, many of the best fruits and finest flowers are produced. This art is well understood by all professional gardeners; and when one new and beautiful or excellent sort is brought forth, out of hundreds of inferior ones, the achievement is duly honored.

The Advantages of Drilling over Broadcast Sowing.

Few facts are better established in the minds of the best farmers of Europe and in the Atlantic States, especially those who have fairly tried it, than that drilling wheat is decidedly preferable to broadcast sowing, whether done by hand or by machine. We have already made brief allusion to this subject, and now, as the season for putting in another crop is fast approaching, we again take it up for more full reference.

The system has already come into almost universal practice in Europe, and every year's experience in the Atlantic States is demonstrating more and more fully its numerous and decided advantages. The Agricultural Department, at Washington, is doing much in this direction in the way of collecting experimental facts and spreading them before the people. We annex a few such experiments for the benefit of our California readers, and give herewith a pictorial illustration of the relative advantages of the two methods, as deduced from actual experience.

A report was made in 1866 to the Good-hue Farmer's Club, of Minnesota, which we condense as follows:—Three fields were seeded with spring wheat of the China Tea variety.

Field No. 1.—Two bushels of seed per acre were sown with broadcast sower and cultivator combined, and covered at depths varying from one to four inches. *Result.*—Good wheat, well filled and standing thick on the ground; but *unequal in growth*—some straws being five or six feet high and others only two. When some of the heads were fully ripened others were quite green; estimated yield 20 to 25 bushels per acre. [A very correct representation of such a growth is shown in figure 2.]

Field No. 2.—One and a quarter bushels of seed sown in drills, east and west, (distance apart not given) 2½ inches deep; no after cultivation. *Result.*—Had better color during growth than No. 1, and was very even in straw and ripeness; the heads were even and of extra length. Estimated yield 30 bushels per acre. [Fig. 2 gives a very fair illustration of such a growth.]

Field No. 3.—Three pecks per acre, in drills, east and west, 2½ inches deep and 18 inches apart. Cultivated once, when one foot high, at a cost of \$1 per acre. *Result.*—Was extra at all times, with deep green color and broad leaves. Appeared like a different kind of grain from Nos. 1 and 2. Stooled out more than either; was uniform in ripeness and length of straw. Estimated yield from 35 to 40 bushels per acre! *Cultivation*, after all seems to be the need, and that can only be reached by drill culture, with quite open rows.

Mr. R. A. Gilpin, of West Chester, Pa., planted in 1866 one acre in a large field, with 3 pecks of seed, drilled in, 20 inches apart. The balance of the field was drilled 10 inches. At the proper time, a small hoe-harrow was run between the single acre, drilled wide apart; nothing being done to the rest of the field. The portion they cultivated took a rapid start and quite outgrew the rest of the field. Though tall and heavy headed, it stood the rains and winds better than the uncultivated portion, which was comparatively thin and light. The cultivated acre was much later in ripening than the balance; but it produced 23 bushels, while the balance averaged only 9 bushels to the acre! Thus cultivation, in this instance also, with wide intervals between rows, seems to have been the principal cause of increased yield—a *single harrowing*, at a cost of not more than \$1.00, producing fourteen bushels extra per acre, (worth in this market from \$11 to \$12) being an increase of 155 per cent. over ordinary culture, besides saving one half of the seed, and time spent in sowing.

A gentleman in Rock county, Wisconsin, reports the cultivation in drills, 14 inches apart, with such marked success as induced him to increase the breadth of sub culture thereafter.

Such examples might be increased indefinitely; but enough has been given to draw attention to the matter, and we trust sufficient to induce a few of the more progressive farmers on this coast, to try some experiments this fall, and report results.

One of the chief advantages claimed for

drill culture is immunity from drought. Deep and uniform planting secures a uniform and healthy start for the grain, which enables it to withstand the severest drought. There is one pre-requisite to the use of the drill, which must always be taken into the account for the proper effect to be drawn from it—the land must be plowed deep and thoroughly pulverized. The chief advantages derivable from drill culture may be summed up as follows:

The seed is covered deep and more uniformly.

The crops are better able to withstand droughts.

Concentrated manures may be placed in the drill with the seed, thereby obtaining the fullest and most immediate benefit from almost the only manures attainable by wheat growers in this State.

Weeds can be easily disposed of, at little cost, and as shown above, with great advantage to the crops.

The plants may thus receive the undivided benefit of the soil and manure, and do not have to maintain a constant struggle with weeds.

By the free admission of sun and air between the rows a stronger and healthier plant is produced and of course a heavier crop.

From 25 to 50 per cent. can be saved in the amount of seed required, while quite as large a percentage is generally added to the average yield.

Various descriptions of drilling machines are manufactured, some with and some without guano attachments. They are also adjustable for grain or grass, and for any width of rows. Any farmer, who has a desire, may experiment upon an

WHEAT SOWN IN DRILLS.—No. 1.

WHEAT SOWN BROADCAST.—No. 2.

acre, more or less; by hand drilling—using a plow, rake or hoe for opening and covering the drills, dropping the seed by hand and performing the after cultivation by hand also. It would be well, in experimenting, to test at the same time the value of manures. Eighteen to twenty inches is doubtless a good distance for the rows; although the English practice is much less—from nine to twelve inches. The soil there, however, is more thoroughly cultivated, (pulverized) and much higher dressed.

If farmers here, would experiment a little in this way, and report results, they would add vastly to the general fund of agricultural knowledge on the Pacific coast, and to the special application of such knowledge here. All human plans are liable to miscarriage, and it is possible that this system, which works so well at the East and in Europe, is not applicable here; but there is very little room for anticipating any such result. The truth, however, can be brought out only by practical experiments in the field.

AGRICULTURAL IMPLEMENTS.—Extensive arrangements are being made in anticipation of an increased demand for agricultural machinery, the coming season. Stocks are large yet prices promise to be reasonable.

PREPARING FOR LARGER CROPS.—The *Tuolumne City News* predicts that there will be more land under cultivation in Stanislaus county the coming season than ever before, and claims that the prosecution of work on the San Joaquin Valley railroad is very encouraging to farmers.

A Fruit Gathering Stand.

There have been numerous kinds of step ladders and other contrivances made on which to stand while pruning large trees and picking fruit from them, in addition to the one shown last week. Any ladder that rests at the upper end against the tree, is objectionable, from the fact that it is liable to slip, and is always breaking the timber, and bruising the bark of the trees, especially when they are small. A com-

mon step ladder, that has a hinged support, is not reliable where the ground is soft or uneven, as it always is in orchards.

What is required is something that is self supporting, stiff, strong, light to move

about, and not liable to tip over when stood upon. The annexed figure represents such a stand.

It has four standards which may be of 2x2½ stuff, about 7 feet long, with 5 feet spread at the bottom, and 2 at the top. Strips of one inch by three are nailed at the right distance, one above another, for steps on two sides, while braces of light material confine the other two sides, as may be seen. Then by solidly nailing some strong inch boards on the top, so as to make a platform about 3 feet square, the stand is finished. One may be roughly nailed together out of picked-up material, in a few minutes; the only tools required being a hatchet and saw, with a few nails. If thoroughly nailed at first, it will last two or three seasons. It may be called a California invention, and we venture the assertion that it is the handiest, cheapest and best thing that has been made for the purpose, especially for young orchards. The lower limbs may be reached while standing upon the lower steps. The platform is very convenient to set the basket or box upon, while picking fruit, and also to stand upon while reaching the upper limbs. The illustration copied last week, from the *Hearth and Home*, showed a ladder that will be found useful and convenient for trees which have branches above the reach of the stand; but for ordinary service we claim the one herewith presented, as the very best stand made.

We should more seldom take offence at each other, if we looked oftener at the why than the what.

How English Beef is Fattened.

The Englishman is proverbial in his quality and love for roast beef. No such "roasts" are found anywhere else in the world. The *modus operandi* of its best production is as follows:—A pit is dug, generally about six feet deep and ten square into which the animal to be fattened is lowered. It is then supplied with all the roots, hay and meal it can digest, and furnished with the needful quantity of water, as well as with an abundance of dry straw for litter. The droppings are trampled under foot by the animal as he moves about his narrow cell, and gradually, by their accumulation, rise to a level with the surface of the ground. When the surface is thus reached he is ready for the knife, and yields a most rich and juicy flesh, besides many tons of the best of manure firmly packed in the pit.

One great trouble with the American beef is, that the animals get too much exercise. Even our stall fed animals are allowed to roam too much. But the worst feature of all is the fact that nearly all the beef which is found in the markets of our great cities is driven thither on foot, and killed without rest or recuperation, and of course in a diseased state. The animals transported by rail are but little if any better, as the motion of the cars, even for a few hours, is extremely weakening and debilitating on an animal heavy with fat. Perfect quiet and good ventilation is essential to good beef.

When a hullock is taken from its pasture and placed in a stall or pit, it continues to grow in bone and in muscle or red flesh as well as to accumulate fat, and the fatty matter is so blended with the muscular as to make the latter tender, juicy and highly flavored.

In fattening, as a general thing, American cattle move too much and hogs too little. The hog needs more exercise while fattening, then a bullock—or at least the evil effects of driving is not so perceptible as in driving cattle. Kentucky hogs driven across the mountains into Virginia, are said to give sweeter flesh and more highly flavored hams than corn fed hogs, pen fattened in Virginia.

Don't Do It.—The *Western Farmer* quietly cautions its readers against saying, when they get home from a County or State Fair, that they have better vegetables, better grain or better stock than they saw on exhibition; and suggests a sure remedy for all such complainings, would be for each man who has anything that is considerably above the average, to do himself and his county the honor of showing it—which is sensible advice for California as for the Mississippi States.

Reading for the Hour.

Thought.

[WRITTEN FOR THE SCIENTIFIC PRESS.]

Human thought is deeply spiritual in its conception and can never be lost; but onward, ever carrying and strengthening under the workings of eternal laws, it lives on, an active force, amidst the elements of mentality surrounding us.

Through the forces of our minds, we are able to unfold living thought—representative of eternal principles. Through us they have birth and start on their regenerating, creative and lawful missions—on a legitimate course, under or in harmony with the universal laws of the universe. Oh, the grandeur and glory of being!

A necessity, motive or aspiration may evolve and animate forces, exterior, and interior, to work out needed problems. As with the ages, so with thoughts, they accumulate, act and react, and by degrees reach a culminating point, and the grand creative thought is ready for form in the world. We give it birth and clothe it according to its nature; it may be a key to a more thorough knowledge of laws governing mind and matter, and requiring a venture of language, or we may suppose it a mere common-place conception, an article of furniture or a labor saving implement, something that needs a tangible existence for recognition and use; yet, be it remembered, it first had existence in a spiritual form in the mind, prior to its having birth and existence in a material form; and its spiritual birth was evolved and created by the action of great and eternal forces.

Is not the spiritual birth of any conception beautiful when viewed in the light of the great eternal forces that created them?

We are always more or less dissatisfied with the garb in which we, of necessity, must clothe our thoughts. Our physical language is only an expression of the outer garb of our spiritual conceptions, and it is but the few, who can scan beneath the vestment, not needed in their native element; but we present them in mortality, that they may become beacon-lights, guides, prophets and comforters for the needy.

Our brightest creations, generated in our spiritual enfoldment, are but seldom recognized; we have no language for them, and we know not where, or how to send them for recognition (or rarely).

Sometimes, when I feel free from the thoughts of others, unbound for the time from the world, these immortal children, will play and exult in my being, until I am fired, and all aglow with their entrancing light. I then perceive them as prophetic of a future, and by their light and revelations, I see that the key to all the forces governing mind and matter here, lie in a knowledge of the human soul and its relations to this universe.

My mind becomes exalted in this light, and I realize that by earnest, systematic, mental work, and frequent self-communings, my own being may unfold and assert itself; that in time I may become a free immortal entity. Time then seems to me a precious boon, and I pray, that when I cast aside this mortality, I can don an immortal robe of my own creation, and joyfully step on the eternal shores, not unmindful or the pilgrimage; but go forward voluntarily and consciously, by the force of my own inherent principles, gathering up the fragrance of my earth flowers for a home in my being forever.

NELLIE W. HUTCHINSON.

San Francisco, Sept. 20th, 1870.

TAKE time to put your words in cartridge shape before you fire them, and you will find increased effectiveness has amply repaid for the extra work.

Home the True Sphere of Woman.

"Florence Carlisle," a lady correspondent of the *Oakland Terminal*, expresses herself in the following beautiful and womanly manner on a much vexed question:

"Home is woman's sphere. There she suffers and grows strong. There untainted by worldly interests, she fosters those intuitive powers, which liken sentinel, sit and watch while reason sleeps high above the reach of a challenge. There she unburdens man of his wearisome cares and girds him anew for life's battles. There she weaves the mysterious leading strings for the nation, and mails the hero that he may go forth to conquer his own passions. There, from sacrifice and suffering, and passion and courage, and tenderness and trust, she fashions the delicate, impalpable network of charms, which every manly soul must realize. There she works out the maternal problem, vitalizing the law of nature with a spark of divinity. There in the same cradle she nurses self-reliance and restraint, courage and caution, heroism and humanity, tempering each by her own high intuitions, and rounding many an imperfectness into a fulness of power; then, when to her eyes the swinging lights shall have gone out, shall yet shine with a strange glory. Oh! who would then thrust woman from her sphere, of which she is the centre and sun?"

Women at the Polls.

Per contra to the above, we have clipped from the "Woman's Rights" paper of this city, (the *Pioneer*), the following:

One of the great hugenurs raised by our masculine protectors to frighten women from the ballot enterprise, is that the rowdy character at our political elections is such as will necessarily contaminate and degrade those women who should visit the polls to deposit their ballots. The friends of woman's political enfranchisement, have, however, invariably insisted that the rowdy and ruffianly manifestations that characterize our primary and official elections do not spring from the necessary corruption of politics, but from the personal exclusion of women from an equal responsibility and participation in the affairs of government. The territory of Wyoming venturing to experiment on these matters, its last Legislature invested the women within the jurisdiction, with the elective franchise. The first general election under the new law was recently held and the influence of women out and around the polling booths, on the noisy and depraved elements that heretofore operated to deter quiet and retiring citizens from depositing their ballots, demonstrated the wisdom of this measure. The *Laramie Daily Sentinel* of the 8th inst., in speaking upon this subject says:

"In every election we have known in this country, a good many peaceable, quiet citizens have been kept away from the polls on account of the quarreling, riot and rowdism which had to be encountered to get in a vote. This time we did not have any of that to contend against. Every one could go and vote as quietly as he could go to church. We did intend yesterday to say all there was to be said on this subject, as far as it concerned our election, but as Wyoming has undertaken to try the experiment and test the practicability of the theory, the world looks anxiously for the result, and is entitled to know it."

The Managing Woman.

Whatever may be thought of the two preceding paragraphs, no one can fail to admire the character portrayed below:

The managing woman is a pearl among women; she is one of the prizes in the great lottery of life, and the man who draws her may rejoice the rest of his days. Better than riches, she is a fortune in herself—a gold mine, never failing in its yield—a spring of pleasant water, whose banks are fringed with moss and flowers, when all around is bleached white with sterile sand. The managing woman can do anything and she does everything well. Perceptive and executive, of quick sight and steady hand, she always knows exactly what is wanting, and supplies the deficiency with a tact and cleverness peculiar to herself. She knows the capabilities of persons as well as things, for she has an intuitive knowledge of character. The managing woman, if not always patient, is energetic and can never be disappointed into inaction. Though she has to teach the same thing over and over again, she is never weary of her vocation of arranging and ordering, and never less than hopeful of favorable results.

A Cheap Gong for Farm and Miners Use.

A cheap and effective gong for farm or miners' use, may be made by taking a inch and-a-quarter round bar of English iron, beat into the form, of the accompanying diagram, and suspended by the loop in the center. The size should of course be made to correspond to the distance at which its sound should be heard. A good size would be one wherein the length of each arm should be about four feet. Such a gong, when struck with a hammer, or heavy piece of iron, will give out a clear ringing sound, which may be easily heard a full mile, under almost any circumstances; while with the wind it may be heard about two miles.

The particular shape herewith represented seems to be the best adapted for the production of sound; and without actual experience no one would believe how very loud and clear it was. The reader will notice that the ends are turned round into a circle of about four inches in diameter, and are gradually brought to a point, the iron towards the end being about half an inch in diameter, and the extremity rounded similar to the end of the finger.

This gong has been found exceedingly useful and may, if desired, be employed with a regular code of signals, a copy of which may be posted up near the gong, so that any person who can read may understand and employ them. For instance a particular manner of striking may be employed for calling to meals. A given number of strokes may call from any part of the works or farm, the foreman or proprietor, when wanted at the office; other numbers may be designated for calling particular persons, or to convey any other special word.

On ordinary occasions a piece of wood—short, stout and club-shaped—may be employed for every-day signals; while a piece of iron, kept always at hand may be employed for giving a general alarm, as for fire. The difference in the sound between using a wood or iron hammer is most marked and unmistakable. The cost of such an instrument is but trifling, and it will last for generations. It should be occasionally smeared with grease, to prevent rust which will deaden the sound. It should be hung by a piece of wire rather than string or rope; as the latter will greatly reduce the sound. Common iron, or that which is as free as possible from lamination, is best for this purpose, as it will be found more sonorous. Steel, of course, would be best; but that would entail useless expense. The cost of a rod of common English iron will not exceed one or two dollars, according to the size wanted; while the workmanship need not amount to any greater sum. The convenience will amply repay the outlay.

OIL WELLS IN SANTA CRUZ COUNTY.—R.

R. Whiteside has a well on his ranch which is yielding from 80 to 100 gallons per day. He tunneled into the mountain about 30 feet where he struck the main vein. The oil bubbles up like boiling soap, emitting large quantities of gas, which is sometimes so offensive as to make it difficult for the men to work. The well is about 300 yards from Chase's mill, on the Soquel Augmentation, and about half a mile from where Mr. Burrell bored a well about five years ago. This oil vein extends from Corralitos to Pescadero, and only needs capital to develop it, and receive rich returns as a reward for the labor. But we cannot expect to do much in the way of developing the vast resources of wealth which abound in our mountain range, until we bring ourselves into rapid means of communication with San Francisco.—*Santa Cruz Sentinel*.

Life Thoughts.

IT IS DARK.—It is dark when the honest and honorable man sees the result of years swept cruelly away by the knavish and heartless adversary. It is dark when he feels the clouds of sorrow gathered round, and knows that the hopes and happiness of others are fading with his own. But in that hour the memory of past integrity will be a true consolation and assure him even here on earth of gleams of light in Heaven. It is dark when the voice of that sweet child, once fondly loved, is no more heard in murmurs. Dark when the pattering feet no more resound upon the threshold, or ascend step by step, the stairs. Dark when some well known air recalls the strains once often attuned to obdildish voice now hushed in death. Darkness—but only the gloom which now heralds the day-spring of immortality and the infinite light of Heaven.

SUNSHINE AND CLOUDS.—Ah! this beautiful world! I know not what to think of it. Sometimes it is all sunshine and gladness, and heaven itself lies not far off, and then it suddenly changes, and is dark and sorrowful, and the clouds shut out the day. In the lives of the saddest of us, there are bright days like this, when we feel as if we could take the great world in our arms. Then come gloomy hours, when the fires will not burn on our hearths, and all within and without is dismal, cold and dark. Believe me, every heart has its secret sorrows which the world knows not of, and oftentimes we call a man cold when he is only sad.

GOD WORKS SILENTLY!—Drop a piece of wool on the floor. Do you hear it? No. How about the snow? Does it make great shout to tell us it is coming? Certainly not. "He giveth snow like wool." It is voiceless! And this is altogether characteristic of Divine operations. The great forces of the Universe are mute. The Sun never speaks. The Atmosphere is mute. Gravitation has no tongue!

LEARN TO LABOR AND TO WAIT.—There are two things that always pay. Working and waiting. Either is useless without the other. Both united are invincible and inevitably triumphant. He who waits without working is simply a man yielding to sloth and despair. He who works without waiting is fitful in his strivings, and misses results by impatience. He who works steadily and waits patiently, may have a long journey before him, but at its close he will find his reward.

In the voyage of life, we should imitate the ancient mariners, who, without losing sight of the earth, trusted to the heavenly signs for their guidance.

The aim of an honest man's life is not the happiness which serves only himself, but the virtue which is useful to others.

OPPORTUNITY is the flower of time, and as the stalk may remain when the flower is out off, so time may be with us when opportunity is gone forever.

EVERY parent is like a looking-glass for his children to dress themselves by. Therefore, parents should take care to keep the glass bright and clear, not dull and spotted, as their good example is a rich inheritance for the rising generation.

BE SLOW TO ANGER.—If a bee stings you, will you go to the hive to destroy it? Would not a thousand come upon you? If you receive a trifling injury, don't be anxious to avenge it. Let it drop. It is wisdom to say little respecting the injuries you have received.

FIGHT hard against a hasty temper. Anger will come, but resist it stoutly. A spark may set a house on fire. A fit of passion may give you cause to mourn all the days of your life.

WHATEVER you dislike in another, take care to correct in yourself.

DELIBERATE with caution, but act with decision, and yield with graciousness or oppose with firmness.

THE FORT YUMA ROAD.—The San Diego people seem in earnest about this road. If the trade of New Mexico is worth having, or will be valuable hereafter, and if San Francisco desires to keep control of the growing districts of the coast, it might be thought that aid would be gladly given here. In a question of the kind, and in a land which grows as rapidly as ours, we should consider not only what is to-day, but also what will be to-morrow. The distance from San Diego to Fort Yuma is 193 miles, thence to Tucson 283 miles, thence to the Burro mines 151 miles; total 627 miles.

Notices to Correspondents.

RAILROAD FLAT.—"F. G." writes us concerning one of the mines at this place without giving his name and address.

A READER.—Give the slide valve a lead from the thickness of a sheet of paper to one-thirtieth of an inch according to speed. For ordinary speed, just about enough to see through, but not sufficient to insert the blade of a knife.

Mining Edition and Agricultural Edition.

We have recently commenced issuing two editions of the Press which differ only in the matter contained in the two reading pages—i.e., in one edition they will contain matter expressly for miners, and in the other especially for farmers. The reading and advertising matter in the other 14 pages will be precisely alike in both editions.

We have divided our mail list so as to send each edition to those we believe it to be preferable to, but as we could not be expected to know the preference of all our subscribers in this matter, we request those who do not get the edition they most desire to inform us at once by mail and we will take pains to have their names changed from one list to the other.

This new enterprise is undertaken with a desire to furnish more reading matter for each of the interests represented, and to make the Press still more popular with its ever widening circle of intelligent readers. It will be continued only in event of its success in that direction.

DIPLOMAS.—Parties entitled to diplomas from the Mechanics' Institute Horticultural and Pomological Exhibition, lately held, in this city, can obtain them by applying to the Librarian at the Institute Building on Post street.

Railroad Matters.

The Northern Pacific Railroad surveys are still being pushed. The Salmon river route is said to be a very undesirable one, according to the report of Capt. De Lacy who surveyed it. We have not seen any report as to the other routes mentioned in our previous article. At the eastern end, work is said to be going on briskly, in grading and track-laying. Maps of the line were filed some time ago, and the commissioner of the General Land Office has issued orders for the withdrawal of lands to the extent of 20 miles on each side. The line runs from Duluth on Lake Superior south to St. Paul, thence northwest through the northerly part of Dakota, along the valleys of the Yellowstone and Salmon in Montana and Idaho, to the Columbia and to its western terminus.

The Oregon and California road is being pushed forward rapidly and the second section of twenty miles was reported ready for inspection on the 23rd. of last month. Cars are expected to be running as far as Albany next month. Concerning the Southern Oregon route, the Oregon Senate and Assembly have passed a joint resolution instructing the Senators and Representatives in Congress to endeavor to secure the passage of a bill to aid a railroad connecting with the O. and C. R. R. in Rogue River Valley from the North Bend of the Humboldt River. "The entire influence of Oregon," says the Yreka Union, "is now against the Pengra scheme, and in favor of the road through on the 'Elliott survey.' We are satisfied now that the 'Pengra road' is a 'dead cock in the pit,' at least, till after the Sacramento and Willamette valleys shall have been connected by a road through Shasta, Rogue River and Umpqua Valleys."

On the Central Pacific (C. and O. Branch) work is to be resumed immediately, and the company are said to intend finishing the road through to Tehama by January, and to Red Bluff by March. The Yreka papers keep track of the surveying parties and stick to it that the Sacramento River route is the best. The Journal of Sept. 28th says that the surveyors are calculating on running the permanent survey on the west side of Mt. Shasta, the east side being objectionable on account of the winter snow. They are also endeavoring to find a route from the head of Shasta Valley out by Sheep Rock towards Butte Creek. The Union of the same date says (by a correspondent) "the survey crosses the Sacramento river—and that appears to be the final crossing—about one mile above Sweet Briar Ranch, from the west to the east side. Thence it runs up the river and crosses Soda creek near its mouth. In crossing Soda creek and the adjacent flats, trestle work will have to be used for about a quarter of a mile. The survey runs thence across a low divide between Soda creek and the river, where a tunnel of some five or six hundred feet will have to be made. F. Smith, informs us that the surveying party had made the survey to the summit of the divide between the Sacramento and Shasta rivers. They had run the line from Soda springs to the summit, on a grade of 95 feet to the mile. The line passes through Fellow's meadow. From the summit it will be easy to descend into Shasta Valley, and when once there, there will be no more serious engineering difficulties till the Siskiyou shall be reached." A Yreka telegram of the 4th inst. says the surveyors are running a line down through Shasta Valley. They proceed down the west side of the river to a point four miles east of town, where they crossed. It is said they will also run a line through town, down Yreka Creek and through to Groat's ferry on the Klamath.

The Sonoma Railroad, says the Herald-burg Flag of the 30th ult., is now in running order, seven miles north of Petaluma, and will be completed to Santa Rosa in twenty days. It will be fenced without delay, as the company advertise for proposals to have the fence completed by the 20th of January next. We are now assured we have seen our last winter of floundering through the mud between Santa Rosa and Petaluma.

The California Pacific has been doing a heavy freighting business in the way of grain. According to the Vallejo Chronicle, on the last Saturday in September, one train brought down 490 tons of wheat, and

that day the road transported 800 tons of grain. The road has had a survey made of the entire line with a view of raising and protecting it against the winter rains. The projected branch, from below Napa, through Sonoma Valley, and thence to Russian River Valley is certainly to be built, if the Chronicle is correct.

The Central Pacific are surveying a new route from Sacramento to San Francisco, via Benicia and Oakland. It is supposed that they have obtained the franchise of the Pacific Terminal Railroad, chartered to run between Oakland and the Straits of Carquinez. Another rumor is that the C. P. will take possession of the San Jose and Pajaro road next January; also that they will extend this down the Pajaro river to a point at or near Watsonville, with a branch to Santa Cruz. About half a mile of snow sheds were burned, on the night of the 4th inst., near Cisco. Origin unknown.

The San Joaquin Valley Railroad is progressing. A large force is at work on the bridge over the Stanislaus, and another is grading to the southward.... A committee of the Board of Supervisors of Los Angeles county and a similar committee from Los Angeles city are to confer with the Los Angeles and San Pedro Railroad Company, relative to propositions for aiding in the extension of the road toward San Bernardino.

At a meeting of the stockholders of the San Diego, Gila, Southern Pacific and Atlantic Railroad, held Oct. 3rd, the following Directors were chosen: Messrs. Marse, Wetmore, Carr, Rose, Gatewood, Robinson, Cleveland, Sedgwick, Mannasse, Bush, McCoy, Watfield, and Pendleton. A new organization was to take place on the next Wednesday. At a meeting of the stockholders of the Southern Transcontinental Railroad Company, held in New York, September 13th, the Company was temporarily organized with Gen. Fremont as President, M. C. Hunter as Vice-President, John D. Freres as Secretary, and Marshal O. Roberts as Treasurer.

The Virginia and Truckee R. R. have commenced laying a track from Carson to Clear Lake. Three engines have lately been received from the Baldwin Locomotive works of Philadelphia.

The completion of the Colorado Central Railroad, from Denver to Golden City, was celebrated at the latter place on the 27th ult. with appropriate ceremonies. A gold spike, presented by Gilpin & Company, and a silver spike, by the Clear Creek Company, were driven into the ground. Three or four thousand people were present. A free banquet was given by the citizens of Golden City, after which followed speeches and toasts. During the proceedings, Colonel Carter, President of the road, was presented with a gold watch.... The Kansas Pacific is in complete running condition. The regular passenger trains, with Pullman cars, leave Denver every day (except Sunday) at 9 A. M.

The Taxes Which Cease.

On the first of October, according to law, there ceased the following:—

Taxes on gross receipts;
Taxes on legacies;
Taxes on passports;
Taxes on sales, except of tobacco, spirits and wines, and those paid by stamps;

The use of stamps for promissory notes for less than \$100, for receipts, and for canned and preserved fish.

Taxes on income, including salaries, will be 2½ per cent. on incomes over \$2,000, instead of 5 per cent. on incomes over \$1,000.

Special taxes, including those on bankers, will cease May 1, 1871, excepting those connected with fermented liquors, spirits and tobacco.

VOLCANIC ACTIVITY.—The authority for the following is a telegram dated San Diego, Sept. 29th.—A party of Mexicans from Lower California, arrived to-day, and report the discovery of an extinct volcano about ten miles from San Rafael Valley, which for years has laid dormant. It has once more broken out in violent eruptions, throwing a column of dense black smoke two hundred feet high, and cinders for miles around its base. It is plainly visible from this point this evening. The whole Southern horizon is darkened with the smoke.

HORSES AND SHEEP ON ICE.—A horse breaks the ice with his foot; sheep crowd together, holding down their heads, and melt the ice with their breath.

University of California.

The Board of Regents met on Monday and took quite a number of important measures. They resolved to admit young ladies into the University on an equality in all respects with the young men; they elected professors in the medical department; abolished the Professorship of Chemistry, Mining and Metallurgy (thereby removing Prof. R. A. Fisher), and included this department in that of Agriculture and Agricultural Chemistry; elected W. T. Welcker and F. Soule Jr. Military Instructors, and adopted resolutions concerning the Fifth Class, of which Prof. George Tait was elected master. F. Bret Hart declined the office to which he was recently elected.

The following are the officers of the medical department: Professor of Surgery, Dr. H. H. Toland; Physiology, Dr. John Le Conte; Chemistry, Dr. Ezra S. Carr; Materia Medica, Dr. J. B. Stillman; Anatomy, Dr. C. F. Buckley; Clinical Medicine, Dr. J. C. Shorb; Midwifery, Dr. J. Blake; Principles and Practice of Medicine, Dr. Thomas Bennett.

It was resolved, that the students at large for special courses are not required to pass an examination for admission to the Fourth class of the University, but shall only be required to possess sufficient knowledge to prosecute the Spanish studies they desire to pursue in the classes they desire to enter.

Also, that the Committee on Instruction, after conferring with the Law Committee as to the powers of the Board in the premises, he and they are hereby directed to prepare a plan or scheme prescribing the conditions on which Fifth Classes in the University may be formed in different parts of the State.

The Committee on the competitive examination for the five free scholarships, recommended the following candidates:—T. F. Barry of San Francisco, D. E. Collins of Oakland, A. W. Jackson, S. B. Cristy and J. C. Rowell, of San Francisco. Each scholarship is worth \$300 per year for three years. The matter was referred to the Committee on Instruction.

The action with regard to Prof. Fisher was most peculiar, and one for which the public demands a reason. That gentleman knew nothing of it until he saw it in the papers. We have made inquiries as to the matter, but can get no satisfaction. It cannot be on the score of economy, while the University keeps up such expensive and unnecessary offices as that of a land agent, etc. According to all we can learn, Prof. Fisher is well fitted for his place. Why expel him in this manner without any charges, any notification? If the heads of professors are to be lopped off in this manner, we may bid goodbye to any chance to get decent men in the University. Unless the public are informed on this point, they will certainly settle down in the conclusion that some personal grudge has been allowed to act to the injury of a good man, and the Regents will expose themselves to the most unworthy suspicions. If Prof. Fisher is unworthy or unfitted to fill the chair he has been occupying, the people should know it; if not, the Regents owe to him ample restitution and to the public an apology.

BLOSSOM ROCK.—Although this obstacle to our navigation has long been removed, yet no official information of the fact by the proper parties has been forwarded to Washington, and Col. Von Schmidt must wait for his money until Prof. Davidson gets back from Oregon, and has farther surveys made to prove that the blowing up of the rock was not an optical delusion.

QUERRY.—A correspondent writes us for information concerning the "Garner Gold Mine" of California. Can anyone give us information as to the condition and locality of such a mine?

Patents and Inventions.

A Full List of Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS TO DEWEY & CO., U. S. AND FOREIGN PATENT AGENTS AND PUBLISHERS OF THE SCIENTIFIC PRESS.]

FOR THE WEEK ENDING SEPTEMBER 27TH.

TOOL FOR CUTTING WOOD MOULDINGS.—Charles E. Bynton, San Francisco, Cal., assignor to himself and Isaac N. Vossburg, same place.

PLY.—David Fulton, St. Helena, Cal.

SASH-HOLDER.—William F. Kelle, San Francisco, Cal.

STEERING APPARATUS.—Turner C. Purington, Vallejo, Cal.

LUBRICATOR.—Ernest Von Jeinsen, San Francisco, Cal.

NOTE.—Copies of U. S. and Foreign Patents furnished by Dewey & Co., in the shortest time possible (by telegraph or otherwise), at the lowest rates. All patent business for Pacific coast inventors transacted with greater security and in much less time than by any other agency.

Notices of Recent Patents.

IMPROVEMENT IN SIDING FOR BUILDINGS.—C. Avery, San Francisco. For the

purpose of finishing houses or other buildings, after the ordinary rough boarding has been put on. Mr. Avery has a very neat plan which admits of any desired amount of ornamentation without detracting at all from its usefulness. He constructs the siding in blocks, cut in various ornamental styles, and so formed that the lower edge of any tier of blocks overlaps slightly the upper edge of the tier next below, thus preventing the entrance of rain. In the cut, B represents the rough boarding, and A, the blocks. These last are put on in tiers and have their upper and lower

edges, c and d, either beveled or cut alternately so as to overlap. To protect the vertical joints between the blocks, in the edges of each block, grooves, a, are made in a diagonal direction, and in these are placed narrow strips of zinc or other suitable substance, b. In this way, the space between this outer and the inner wall is kept dry, even if the siding should shrink considerably and leave cracks.

MAXILLARY COMPRESS.—C. E. Davis, St. Helena. One of the most disagreeable of operations to which civilized man is subjected is the extraction of teeth. There are a few people who apparently do not suffer much therefrom, but the majority have a great dread of it. Although not apt to be dangerous, yet it often gives rise to profuse and frequently violent hemorrhage, which in many instances can be arrested only by filling the cavity with cotton or other substance until coagulation takes place. To retain this substance in place is the object of the present invention. Small plates are made of gold, silver or other suitable material, with edges turned up to form flanges which fit on either side of the gums, and provided with suitable slots, bolts or rivets, so that the compress may be made to fit the gums at any point, and with clasps for fastening to the teeth. The cotton being placed in the cavity, this device is easily attached and remains permanently fixed as long as is necessary.

DEVICE FOR SEWING COVERS UPON SEWING MACHINES.—J. H. Mooney, S. F. In order to protect the mechanism of the sewing machine from dust, etc., when not in use, a case or cover is employed, which is frequently made in two parts and hinged together so that the portion immediately over the cloth plate can be turned back upon the other part when work is to be done. Now to secure the cover fast to the table there is attached to the cover a barrel (provided with an inclined slot) through which runs a rod, which has a pin projecting through the slot in the barrel, and a lug or projection at or near the lower end. This fits under a circular plate attached to the table, and by turning the rod, the pin, following the inclined slot in the barrel, presses the cover firmly down on the table.

Improved Combination Planer.

There are a large number of wood planers in the market; but one which has met with much favor among wood workers, is shown in the cut on this page. It is a combination of the Daniels and Woodworth Planers—the principle of either one of which forms the basis of all wood planers. This machine is so well known that it seems almost superfluous to go into a detailed description of it. It was first patented April 13th, 1852, and re-issued in 1860. Mr. S. A. Woods of Boston, the owner of the patent and the sole manufacturer, has patented a large number of improvements on the machine since then, which add very materially to its value.

It will be seen, by referring to the cut, that the feed-roll attachment is so perfected, that they can be used for surfacing boards, and with continuous feed; as they can be swung back on its hinged frame (as shown by the dotted lines) so that they lie longitudinally with the carriage, entirely out of the way, on the back side of the machine. The carriage can then be brought directly into use, and lumber dogged and planed out of wind with great rapidity.

GRAY & WOOD'S IMPROVED COMBINATION PLANNER.

The cut represents a board being planed, the end of the board being supported by a small frame, which, when not required for this purpose, is swung down between the side pieces of the machine, giving place for the carriage to run back. The end of the carriage has an iron plate made fast, on which the board slides upon being planed, while the other end of the carriage makes a table to support the board as it comes from the machine. The rolls are driven from the clutch or feed shaft, which drives the carriage when it is brought into use; the latter being driven by rack and pinion, and the former by gears arranged on the back side of the machine by a peculiar method, which renders them very durable and easy to adjust. The hinge on which the feed-roll is hung is not shown in the cut, it being on the back side of the machine.

When the machine is used for trying out stuff, the dogs (which are seen in the cut lying on the floor) are used for fastening the lumber upon the travelling carriage so that stuff can be planed straight and out of wind, varying from 1½ to 16 inches in thickness, from the fact that no pressure is allowed upon the stuff when used for this purpose; the gauge bar or roll, in the rear of the cylinder, being set exactly on a line with the cutting edge of the cutters, so that, by a combination of the dogs and travelling-bed, stuff is passed under the cutters in its crooked or warped state and reduced to a smooth and true surface. The dog is so arranged that stuff with oblique ends, or two pieces of unequal lengths, can be dogged at the same time, simply by turning the wheel, which by means of the screw, the swivel dog having the two adjustable arms attached, is forced against the lumber, holding it as firm as though the end was square, or the two pieces of equal length. The movable dog can be adjusted to any length of stuff by means of teeth or cogs, as shown on the side of the bed.

The machine can also be used for planing stuff as thin as 1-16 of an inch by removing the dogs from the carriage and placing the stuff to be planed on the carriage, and adjusting the pressure roll so as to keep the stuff firmly on the carriage, running it back and forth at pleasure. The patent cutter head, or cylinder, is of such peculiar form that it makes a complete concave cap of double iron, which is found indispensable for planing cross-grained hard wood.

A large number of these machines are in use in San Francisco and other cities in the Pacific States; and we are assured that they give universal satisfaction. For any further information, address Berry & Place, the manufacturer's agents, who keep these machines on hand at their Machinery Depot, 112 and 114 California St., San Francisco, and who will doubtless be pleased to answer all inquiries.

HOPE GRAVEL MINE.—In our mining summary last week, there appeared an item to the effect that sixty six ounces of gold had been taken out of this mine in three days. This is incorrect. The fact is that this amount was cleaned up from about two weeks run. We have received from official sources some very interesting items concerning the mine, which we publish. The item, we may state, was taken from

REVENUE LAWS.—The recent enforcement of certain provisions of the Revenue Laws bears heavily on San Diego, as it is a prohibition of its trade with Lower California, which is getting to be quite important. The San Diego Union comments on the fact, urging future action of Congress, but deprecating grumbling against the Revenue officers, who must obey their instructions. We see, by the way, that Mr. W. S. Dodge retires from, and Mr. Douglas Gunn assumes, the editorial control of the Union. If the latter gentleman gets out as good a paper as the former has done, he will do well.

HARDWARE AND METAL TRADES DIRECTORY.—This book, comprising a list of all the manufacturers, importers, wholesale and retail dealers, commission merchants, brokers, and artisans in all the base metals and all goods manufactured from them, in the United States, has just come to hand. We have previously alluded to it, and now that we have received it, are pleasantly surprised at its appearance, for the book is exceedingly cheap for its price (\$6). As it contains much valuable information for

the trade, we should imagine that it would be extensively patronized. It ought to be, at least. It is published by the enterprising firm of Wentworth & Co., of Boston, Mass., who may be addressed for copies of the book or for advertisements in the edition to be published in 1872.

The Pacific Iron Works have just turned out a large amount of machinery, for the Cariboo Mines, British Columbia. It is for pumping and hoisting works, and for driving a saw mill. The engine is nominally 60-horse power, and has two tubular boilers, with steam drum, each 44 inches by 14 feet. Two 10 inch Cornish pumps, capable of throwing 2,000 gallons per minute, and a pumping engine with 15-inch cylinder, capable of throwing 350 gallons per minute, are among the items. The whole is intended for the Lane and Kurtz Cariboo Mining Co., whose enterprise promises to be of great importance to our neighbors.

OF A HIGH CHARACTER.—We notice that the Messrs. A. and T. B. Young continue, under the name of William J. Young and Sons, the business of the late William J. Young—a business which has continued under the control of William J. Young or his Sons for almost fifty years. Thus each partner has an educational experience in the workshop, as well as the study, which is a guarantee of the excellence of the productions of the firm. Their mathematical instruments have an enviable reputation. They have enlarged their line somewhat, giving special attention to stationery and field and office equipment. Every one knows that they are at No. 43 North Seventh street, Philadelphia.

One of Davis' refrigerator cars went East this week filled with choice fruits shipped to New York.

Our Printed Mail List.

Subscribers will notice that their names are printed on colored paper and pasted upon each copy of the Press. This is done by machinery, to expedite the issue of our paper, the regular edition of which has become too large to be convenient to send out by the old method of writing the names. The figures found on the right of the pasted slips represent the date to which the subscriber has paid. For instance, 21st 70 shows that our patron has paid his subscription up to the 21st of September, 1870; 41st 71, to the 4th of January, 1871; 41st 70, to the 4th of July, 1870. The inverted letters occasionally used are marks of reference, simply for the convenience of the publishers.

In setting up the list the compositor made some few errors which have been rectified by a careful revision and comparison with the mail book. If errors in the accounts of subscribers occur at any time an early notice will secure their immediate correction.

If names, initials, or the address in any particular is wrong or incomplete wish to be favored with a notification of the fact.

DESIGNS AND PLANS

— FOR THE —

NEW CITY HALL

— OF —

SAN FRANCISCO.

Office Board of City Hall Commissioners, southeast corner of Sacramento and Montgomery streets, San Francisco, June 22, 1870.

The Board of City Hall Commissioners hereby give notice that they will be prepared to receive at their office, on or before the FIRST DAY OF NOVEMBER NEXT, designs and plans for the new City Hall of San Francisco.

The Commissioners, in order to obtain the very best design and plan, invite the fullest competition among architects, and to this end have resolved to offer the following premiums:

First—For the design and plan selected and adopted.....\$2,500
Second—For the second best design and plan..... 2,000
Third—For the third best design and plan..... 1,500
Fourth—For the fourth best design and plan..... 1,000
Fifth—For the fifth best design and plan..... 500

The premiums payable in City Hall warrants.

As a guide to architects in the preparation of the designs and plans, the Commissioners have prepared a pamphlet containing full instructions and suggestions, as well as the terms and conditions upon which the premiums will be awarded.

Pamphlets can be had on application at the office of the Commissioners.

Any design or plan in which the requirements of the Board, as set forth in the printed instructions, have not been reasonably complied with, will be rejected from the competition.

P. H. CANAVAN, Chairman,

JOS. G. EASTLAND,

CHAS. E. McLANE,

City Hall Commissioners.

BLAKE'S PATENT
STEAM PUMP.

THESE PUMPS.

Have been tested, and found to be indisputably without an equal wherever tried. They are constructed in the most simple style, and built in the most thorough manner—especially calculated for SIMPLICITY, DURABILITY and POWER.

Some of the advantages of the Blake Pump may be summed up as follows:

It is POSITIVE UNDER ANY PRESSURE. May be run slow or fast as may be desired. Will discharge more water than any others of the same dimensions. Has no leaky joints, the steam part being cast in one entire piece. The steam valve is perfectly balanced, is cushioned at each end, and slides with the greatest facility, having no Cams, nor complex Rotary arrangements to get out of order. Will start at any point of the stroke, and will discharge all the water of condensation.

The Pump has no crank or fly wheel, thereby saving a considerable item of expense to the purchaser. Having no near points, it therefore needs no watching, and is consequently ready to start without using a starting bar or any hand work whatever. The Blake Pump is extensively used

On Railroads and Steamboats; in Hotels; for Mining and Fire Purposes; in Breweries, Tanneries, Sugar Houses, Factories, Mills, Laundries, and as BOILER FEEDERS, wherever steam is employed. In fact, wherever water or other liquids are desired to be raised in large or small quantities, or against heavy or light pressure, it is the

Cheapest and Best Pump that Can be Used.

It is offered to the public as the most perfect independent Steam Pump ever invented. FORTY DIFFERENT sizes are made, capable of throwing from 1,000 to 200,000 gallons an hour, and adapted to any class of work that might be required. For sale by

BERRY & PLACE.

112 and 114 California Street, San Francisco.

Every pump will be warranted to perform the work required of it by the purchaser, or it may be returned and the money will be cheerfully refunded.

Awarded a SILVER MEDAL at last Exhibition of Mechanics' Institute, San Francisco, and State Fair at Sacramento, as being the Best Pump on Exhibition.

STEVENSON'S PATENT MOULD BOARD AMALGAMATING PAN.

This Pan is far superior to all others in several important particulars. The grinding mullers are near the center, requiring less power. The plow-shaped grooves raise the quicksilver with the pulp regularly, with less power, without violence, and with better amalgamating effect, besides admitting of a larger charge. The inclined-shaped housings of the muller plate openings efficiently force the pulp directly under the mullers.

It has been constantly running for over eight months, and has proved, in competition, to produce a higher percentage of bullion, with less power and with great saving of quicksilver, over any other pan in use. It is simple in construction and operation, and cheaper in first cost and economy in wear.

Manufactured at the Golden State Iron Works (Co-operative), 19 First street, S. F.,

Where it can be examined and further particulars be learned; or persons may apply to the inventor and patentee, Mr. C. C. STEVENSON, at the Douglas Mine, GOLD HILL, STATE OF NEVADA, where the Pans have long been in constant operation. 15v20 1mr, 1amf

Wine and Table Grapes a Specialty.
Nursery and Greenhouses: one mile North of the Asy-
lum, 15v21-4m. Stockton.This celebrated medicine has won a deservedly high
reputation as an alleviator of pain and a preserver of
health. It has become a household remedy, from the
fact that it gives immediate and permanent relief. It is
a purely vegetable preparation, made from the heat and
purest materials, safe to keep and to use in every fam-
ily. It is recommended by physicians and persons of all
classes, and to-day, after a public trial of thirty years—
the average life of man—it stands unrivalled and unex-
celled, spreading its usefulness over the wide world.
Its large and increasing sale affords positive evidence of
its enduring fame. We do not deem it necessary to say
much in its favor as one small bottle will do more to
convince you of its efficacy than all the advertisements
in the world. Give it one fair trial and you would not
be without it for ten times its cost.
Direction: accompany each bottle.

The Well-Sinker Giraud.

Monsieur Simonin, in "La Via Souteraine," tells some pretty big stories, and tells them well, although, as he says, he has been strictly excluded fiction from his pages. Here is the description of an accident to a well digger.

Falls are the kind of danger which always enter into the imagination when underground works are thought of. Nobody in France has forgotten the story of Giraud, who was excavating a well near Lyons in 1854. The poor fellow, dashed to the bottom of the hole by a fall of the ground from above, which had been perhaps insufficiently propped, beheld a sort of vault suddenly from above his head, which crushed him under its weight, and kept him prisoner together with his fellow workman. The question then was how to save these poor fellows. It was necessary to dig a new shaft near the first, and then to connect the two by means of a drift-way, which should strike it at the point where the accident had taken place. In spite of all the exertions which were made, a whole month was spent in bringing the operation to a close, for fresh falls occurred in the new workings themselves. Giraud and his comrade heard the noise of the picks, and replied to the workmen, thinking every moment that the hour of deliverance was at hand. Vain hope! The second man died. Hunger added its horrors to the sufferings of the survivor, as in the sad story of Ugo-lino.

Giraud, a person of greater energy than his companion, bore up. The corpse of his friend, which lay near him, poisoned the little air he had to breathe; but the desire to live sustained him. Neither hunger, nor this unpleasant proximity, cast down this man: he wished not to die. He carried on the contest for an entire month. Every moment it was expected that he would be reached, when some fresh accident happened, which rendered it necessary to begin the work anew. Giraud did not succumb; he replied distinctly to all the questions that were put to him. France, indeed, all Europe, watched the contest day after day, and a bulletin was published every evening of the day's progress. On the thirtieth day victory was achieved, and Giraud was saved. Pale, wan, and reduced to a skeleton, his body was a mass of sores. Gangrene had attacked all his limbs, caused by the corpse, which for three weeks had been rotting by his side. The unfortunate well-digger was carried to the hospital at Lyons, where, after lingering on for some time, he expired.

A New Cataract.

Mr. R. Brown writes to the London Times that Mr. C. B. Brown, of the Geological Survey of British Guiana, has discovered, on the Potaro river, a waterfall with a clear descent of 736 feet. The width of the river, 200 yards, above the fall, was 402 feet. The following is the description given:

As we saw the Fall I cannot imagine anything more beautiful. The central portion, which is never dry, forms a small horse shoe or retreating angle, and the water in this part preserves its consistency for a short distance from the ledge. But everywhere else, and here also at a few feet from the top, all semblance of water disappears, it breaks up, or blossoms, into fine foam or spray, which descends in the well-known rocket-like forms of the Staubbach and similar waterfalls, but multiplied a thousand times, into a small dark pool, over a semi-circular curtain of precipice deeply hollowed by the action of the spray. The cavern behind the Fall is the home of thousands of swallows, which issue from it in the morning, and may be seen returning in their multitudes at night. The Fall itself is one vast descending column of a fine, dry-looking, snow-white substance, bearing a resemblance, in color and consistency, to the snow of an avalanche, but surpassing all avalanches I have seen in size, and in the beauty of the forms taken by the material of the Fall. Rainbows of great splendor were observed, one from the front of the Fall in the morning, one from the summit in the afternoon; but this last reverted, forming a colored loop or ring, into which the whole mass seemed to precipitate itself and disappear, and dart out underneath, black and foaming, at the gorge and outlet of the pool.

THE SHIP OF THE DESERT.—A party has left San Bernardino to visit the wreck of the ship on the Colorado Desert, near Los Palmos Station.

Churns and their Philosophy.

The various forms of churns may be classed under four divisions, as follows: 1st, those in which both the fluid and the containing vessel, with its agitators are in rotative motion; 2d, those in which the containing vessel is at rest, and the agitators in rotative motion horizontally; 3d, those in which the containing vessel is at rest and the agitators in rotative motion vertically; 4th, those in which the containing vessel is

the rotative horizontal motion of the agitator. In reaching after these advantages the interior of the churn has been constructed entirely of wood, so that no corrosion may take place; it has been made smooth as possible, that the agitation may not be too violent or abrupt and that no recesses may be left, which will be difficult to clean. The dashers are four in number and perforated, so that the agitation may be perfect.

An examination of Fig. 2 will show a very

BLUST'S IMPROVED CHURN.

Fig. 2

at rest, with the agitators having a rectilinear, vertical motion.

There are various, in fact almost innumerable modifications of each of these classes or families, which like most other large families, have many "poor relations," from among which there are large opportunities for choice.

The chief point sought in agitating cream for producing butter, is the rupture of the oil or butter globules, suspended in the cream, and which, by that rupture are made to cohere in a semi-solid mass, so as to be separated from the fluid. Moreover this process must not be carried too far, as may be done by a too violent agitation, whereby the granulation of the butter will become destroyed, and an inferior article produced.

The churn herewith represented belongs to the second class, as above described, and the aim of the inventor has been to secure all possible advantages derivable from

convenient mode of adjustment of the shaft and dasher, whereby the same may be easily removed for more thorough cleaning.

The general form of the churn is shown in Fig. 1. Fig. 2 shows the mode of attaching the crank. A bracket, A, is screwed to the body of the churn, as shown in Figs. 1 and 2. This gives two bearings for the short shaft, B, Fig. 2, which is kept in place when in use by a key, C, driven through a slot in B. The annulus about the shaft is closed firmly against leakage by a rubber-faced metallic washer, kept tight by a second key, D.

The end of the short shaft, B, is squared to enter a mortise in a plate, E, screwed to the dasher arms; and by tapping out the key, C, it may be withdrawn and the dashers removed, while the churn is half full of milk, if desired.

The inventor claims that this churn breaks the cream easily and makes good butter, and that it churns with ease, so that a small child can work it; that it will churn a small or large quantity equally well; that it is very convenient for putting

in the cream and taking out the butter, and for cleaning after use; that the dasher can be removed at any time and the milk left in the churn, though it be full; and that the device combines all the merits of both the box and barrel churns, with several advantages over both.

Patented, by C. Blust, whom address for further information, at Lucas, Ohio.

Useful Receipts.

A HOME MADE PAINT FOR WORK.—Mr. J. U. Gouch, of Mokolunne Station, who has tried it, informs us of a superior composition for covering fences and other rough work, which can be made by the simple use of common whiting, lime, salt, and the mucilage of the prickly pear. The lime should be slacked, and while hot, ten pounds of whiting and five pounds of salt should be added. The mucilage is prepared by chopping up the leaves of the prickly pear, soaking them in water about twenty-four hours, and then drawing off the liquid. This liquid should be mixed with the ingredients until the whole is brought to the consistency of common paint. It adheres well to the walls of rooms, and is pronounced by our informant a very desirable article for outside use, as may be seen by examining old walls covered with it by the Spanish population of California many years ago.

CULTIVATED WILD OATS.—Michael O'Hara, of Pleasant Grove Creek, Placer county, has raised, this season, something over 1000 bushels of cultivated wild oats. These are said to be the best oats for hay and do well in the foot-hills. Mr. O'Hara has saved a lot of seed for sale.

RICHARD THREFAILL, of Stanislaus River, San Joaquin county, raised 46,000 sacks of wheat the past season. His samples exhibited at the State Fair were very good. The summer fallowed ground produced by far the most profitably. He has now 8,000 acres more summer fallowed.

HOW TO CLEAN ZINC.—Rub thoroughly with salt and vinegar. Another recommendation is to take lard and rub it on with a cloth, thoroughly; then rub dry with another cloth.

HOW TO REMOVE PLUM STAINS.—If you have a bed of tansy growing, spread the article upon same; or take a handful of tansy, tie it up in a cloth and boil with the goods. This will remove almost any stain.

FRIED BREAD.—Put into a common hieuit-pan a heaping teaspoonful of butter, and let it melt and spread over the pan; then take enough slices of bread (stale answers as well as new) to cover the bottom of the pan, and make a mixture to dip them in by beating well two eggs and pouring in milk enough to soak the bread; season it with a little pepper and salt—make the bread quite moist; then lay it in the butter and fry brown on one side, and, if too soft to turn, put them into the oven to brown on the top, and you will have a dish that serves for meat and potatoes, consisting of neither.

TO CITRONIZE GRAFFS.—Prepare clarified syrup by dissolving eight pounds of sugar with one quart of water, and then boil in this eight pounds of green Catawba or Isabella grapes until they begin to shrink, when they should be opened on dishes to cool. Keep the syrup boiling, and when approaching the usual consistency of good syrup, replace the grapes, boil about ten minutes, when they will become fit for the jars and for use during the summer and fall months. If to be kept for years, add a quarter of a pound more of sugar.

HOW TO CANDY CITRONS.—Can you, or any of the subscribers to the Press, tell me how to candy citrons? I have grown a few this season, and would like to candy some of them and save buying from the store for use in spice bread. You will understand what I mean, I hope, in saying candied citron; some people call it candied lemon.

BRETS are very nice cooked in the following manner: Slice cooked beets quite thin, put in a saucepan with some vinegar, water and a piece of butter, with sugar enough to make palatable. Any rule is impossible. Taste it, and if any ingredient is lacking, add more of it; salt a very little, and pepper; thicken the whole slightly; serve hot.

Where they are manufactured.

A NEW REMEDY.

As this Preparation of these plants, lately made public (Patented June 23, 1870), but long proven in Siskiyou county, Cal., owes its efficiency entirely to its remarkable power of INCREASING THE INSENSIBLE PERSPIRATION, or, in other words, the VAPORY EXHALATIONS from the millions of minute pores of the EXTERNAL SKIN, from the crown of the head to the sole of the foot, it is all important that the direction to pass a sponge, or towel, dampened with salematus water, under the clothing, twice a week, or oftener, be attended to.

Also, that when taken by LADIES, for IMPROVING THE COMPLEXION, for which it is very successful, that it should be in half doses, often repeated; and that one of the Pills of Citrate of Iron and Gum Myrrh, which are beneath the bottom label of each bottle, be taken at night, much aiding in restoring Color in the Cheeks and Lips. To CHILDREN also, give it "little and often." It is agreeable to them in any way, but especially if sweetened a bit; and it is admirably suited to their Diseases, which generally are those of the MUCOUS MEMBRANES.

FOR the irritated throats of PUBLIC SPEAKERS, Lawyers, Ministers, Teachers, and FOR driving off threatened CONSUMPTION and Asthma, all Colds and Coughs; FOR irritated Stomachs, from Bad Liquor, Alkali Water, Strong Coffee, Saleratus Bread; FOR humors on the Skin, or MUDDY COMPLEXIONS, or, in a single sentence, FOR all Diseases of the MUCOUS MEMBRANES, the Surest, and by far the MOST PLEASANT MEDICINE yet found, in its TASTE and EFFECT, is

DR. FURBER'S CORDIAL OF MOUNTAIN BALM —AND— OREGON GRAPE, Two Plants, abounding on the base of, and on the Mountains surrounding MOUNT SHASTA, CALIFORNIA,

For all of the purposes of the various PREPARATIONS OF SASSAPARILLA, richer in quality and more efficient as a RESTORER OF GOOD BLOOD, and acting equally as surely,

and as well on the LUNGS as on the STOMACH, is superior to other COUGH MEDICINES, by bringing BOTH to bear with the stimulated action of the WHOLE SKIN in throwing off Disease of either.

FOR SALE AT SAN FRANCISCO BY
R. H. McDONALD & CO., Druggists.

INVALIDS of any of the classes named above will find this worthy of TRIAL. Its virtues, as above asserted, not being visionary, but improved from the SHASTA INDIANS' knowledge and use of these PLANTS for centuries back, made known by them to us.

Such an Invalid, residing at a distance, wishing to try it, had better procure a package of one-fourth of a dozen, which can be done by sending in letter to the above a \$5 greenback, and directing that the package should be sent by WELLS, Fargo & Co's EXPRESS to that office which is nearest to the invalid's residence, and that person will be sure to get it.

PHOTOGRAPHY.—FOR CABINET PHOTOGRAPHS, or Enamined Cards, of the very best quality, you must go to the NEW YORK GALLERY, Nos. 25 and 27 Third street, San Francisco. Every picture warranted to give satisfaction.

SCIENTIFIC PRESS.—We are pleased to learn that the circulation of this valuable journal is rapidly increasing in all the States and territories on the Pacific Coast. The efforts of the proprietors of the SCIENTIFIC PRESS, Messrs. Dewey & Co., to furnish a reliable paper for the miner, farmer, mechanic and inventor, are successful, and their paper has obtained an enviable reputation for ability, and truthfulness. L. P. McCarty, travelling and corresponding agent for the SCIENTIFIC PRESS, is now in town, and has succeeded in securing a large addition to its subscription list in Nevada and Placer counties.—Nevada Gazette.

New Advertisements.

Every Advertisement in this journal is published throughout its entire Mining, Agricultural, Monthly and Quarterly Editions.

Thursday Evening.

Owing to the time necessary to mail the present large edition of the SCIENTIFIC PRESS, we are obliged to go to press on Thursday evening—which is the very latest hour we can receive advertisements.

BILLIARDS.

MESSRS. PHELAN & COLLENDER,

The well-known Billiard Table Manufacturers of New York, have established at 541 Market street, this city an extensive branch of their business, where they propose to keep constantly on hand the largest and most complete assortment of Billiard Tables, Cloth, Cues, etc., on this coast. The Tables are of the latest styles and size recently adopted in the Eastern States, are manufactured in the best possible manner, and furnished with Pheban's latest improved Cushions. All goods sold will be of the best quality, and the prices fully as low as any other house in the business. The public are invited to visit our warerooms and inspect our stock.

15v213a

To Hydraulic Miners.

Last season I patented my improved discharge pipe for Hydraulic Mining. I manufactured and sold six of them. They were used by the parties whose answers to inquiries as to merits or demerits, find hereunto appended.

Holding such opinions it is not strange that Gold Run miners think the Press correspondent got things slightly mixed when he represented them as preferring Craig's Globe to the Dictator.

RECOMMENDATIONS:

Your Patent Discharge Pipe known as the Dictator exceeds my expectation. I am now using a 4-inch nozzle at 200 feet pressure and can move my pipe in any direction with one hand. I consider it a perfect success and far ahead of the Globe Joint.

H. KELSEY,
Jehosophat Co., Dutch Flat.

I fully endorse Mr. Kelsey's opinion and intend to use the one I have on my upper bench and get one of your large ones for the bottom next season.

J. PHILLIPS,
Central Co., Dutch Flat.

Your Dictator gives perfect satisfaction. Get me another ready against water comes.

W. JUDD,
Ind. Hill, Gold Run.

The Dictator is a perfect success. I shall want two for the Kearsarge Claim next season.

H. H. BROWN,
Gold Run.

Get me two Dictators of the large size ready against next season. I shall run both at Indiana Hill and lay aside the small one I have. This is sufficient answer as to how I like my pipe.

JASON REINKS,
Indiana Hill.

I pronounce the Dictator ahead of the Globe. I would perhaps use Craig's Globe if I could get nothing else. I am working at over 300 feet pressure and using a 4-inch nozzle, yet can move my pipe easily with one hand.

W. O. BROWN, foreman,
Golden Gate and Church Claims, Gold Run.

We want you to get ready for us two more of your large size Dictators for the Cedar Claim against next season.

BROGAN & CO.,
Gold Run.

These Joints being protected by letters patent dated June 1870, I will prosecute all parties infringing whether by manufacture or use.

I will guarantee against all suits for infringement by parties holding untenable patents and wishing by tactics of law to secure by intimidation a monopoly for an inferior article. For particulars apply to

R. HOSKINS, Dutch Flat, Placer Co.

ROOT'S PATENT FORCE BLAST ROTARY BLOWER.

MANUFACTURED BY KEEP & BARGION,

At the Globe Iron Works, Stockton, California.

Patented Nov. 1st, 1864; July 24, 1866; and Oct. 9, 1868.

Awarded the First Premium at the Paris Exposition.

ADAPTED FOR Smelting, Foundry, Mining and Steamships.

REQUIRES Fifty Per Cent. LESS POWER Than any Blower Now in use.

One of these Blowers may be seen on exhibition at W. T. Garratt's Brass Foundry, corner of Mission and Fremont street. They are also in use at the Almaden Quicksilver Mine; Gridley's Foundry, Gold Hill, Nevada; Aetna Iron Works, San Francisco, and many other places.

CAUTION.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirement of the genuine article.

Quartz, Saw and Grist Mill Irons, Steam Engines, Horse Powers, High and Low Pressure Steam Engines, Steamboats and Propellers, made at short notice.

NOVELTY MILL AND GRAIN SEPEARATOR.

THE undersigned having purchased of the Patentes, WIRTS & SWIFT, of Hudson, Michigan, their right to this mill, Patented June 23d, 1869, for California, Oregon, Washington Territory, Montana, Utah, New Mexico and Arizona, wishes to call the attention of FARMERS, MILLERS AND GRAIN DEALERS to one of THE GREATEST IMPROVEMENTS OF THE AGE for cleaning and separating grain. While it combines all the essential qualities of a first-class FANNING MILL, it also far exceeds anything that has ever been invented for the separation of grain. It has been thoroughly tested on all the different kinds of mixed grain, separating all the different seeds in almost a magical manner, placing them in their different compartments in the mill arranged for their reception, at the same time taking out all the Mustard, Grass Seed, Barley and Oats, and making two distinct qualities of wheat if desired, thereby selecting superior, large plump and perfect kernels for SEEN WHEAT, and all the small and cut kernels, such as merchantable wheat, is deposited in another compartment. By the use of this mill a great quantity of wheat usually sown that has been cleaned in the common mills will be saved to the farmer, as the cut or shrunken kernels will never germinate.

The above mentioned Novelty Mill is the only mill known to possess all these superior qualifications, and was exhibited and tested at the last Michigan State Fair held at Jackson, Michigan, September 21, 22, and 23, 1869, and bore away the palm over some thirty other different mills from all parts of the United States, including the famous Dickey Mill of Racine, Wisconsin. All who have witnessed here the operations of the NOVELTY MILL, declare it perfection, and the most beneficial invention to the Farmers, Millers, and Grain Dealers ever introduced on the Pacific Coast. The farmers in Santa Clara County, are loud in its praise, and also in other parts of the State where it is being introduced. No. 1 Mill, complete, is capable of cleaning 25 tons of grain per day; No. 2 Mill, 16 tons; No. 3 Mill, 8 tons. A large number of recommendations and certificates of the practical working of the mill will be furnished. Circulars containing references sent free by mail. N. B. Town, County, or State Rights for saloon favorable terms. For further particulars apply to

THE WILSON

Patent Steam Stamp Mill.

This extraordinary Mill, now so justly popular in the East, is now offered to the miners of the Pacific Coast. Having been in operation now for about two and a half years, the Company feel confident that the

WILSON STEAM STAMP MILL,

For Durability, Efficiency,

AND ECONOMY OF WORKING,

HAS NO EQUAL.

The Wilson Steam Stamp Mill is the only Steam Mill that has had the severe ordeal of practical working, and proved itself eminently successful. It is now in operation in several of the Eastern States and Territories, and gaining an enviable popularity. The whole machine is so simple as to be readily understood by the most ordinary minds. In fact, its simplicity is its durability. The expense of crushing rock or cement with this Mill is less than one-half the expense of any other Stamp Mill, and less than one-half the cost. For further particulars inquire of

FURMAN R. WILSON,

San Francisco.

Or of THE WILSON STEAM STAMP MILL CO., 326 Walnut street, Philadelphia, Pa.

Notice.—All persons are hereby warned not to manufacture or use any Steam Stamp Mills that are an infringement on the Wilson Patents, as they will be prosecuted to the utmost rigor of the law.

F. R. WILSON,

20919-11 Supt. W. P. S. S. M. Co., Philadelphia.

VARNEY'S

PATENT AMALGAMATOR

These Machines Stand Unrivaled.

For rapidity pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared, to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits. They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows.

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Settlers made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Millmen are invited to examine these pans and settlers for themselves, at the office, 229 Fremont Street, San Francisco.

SCIENTIFIC PRESS.—This paper comes to us this week with a full double sheet extra. It contains a full map of California, a map of the San Joaquin valley, with a brief description and statement of the productions of each county, besides the usual mining, agricultural and economic intelligence. It is a paper that should be in the hands of every farmer, miner and manufacturer on this coast.—New Transcript.

Barnes' Thill Holder.

This coupling can be attached in a few minutes and it is absolutely certain that it will not release itself while the horse is attached. It is durable, noiseless, in good taste, and in short, a perfect Thill Coupling in every respect. The best recommendation that we can send out is the Coupling itself. A full set will be sent to any one for \$5, and the money will be returned if they are not liked. Shop Rights for sale.

Dennis Combination Gridiron.

No one who has studied the laws of Health will fail to appreciate this valuable culinary implement. It is well adapted for cake baking and other purposes, as well as for broiling meats. Foundry-men will find it to their advantage to examine it. The right to manufacture and sell is for sale cheap. Send for circular, or call and see sample Gridiron.

Steam Cooker.

This simple and practical Cooker can be attached to any Cooking Stove, and prevents the possibility of scorching or burning food. It facilitates cooking and saves fuel. Don't fail to call and see the model or send for descriptive circular.

P. Davis' Wire and Picket Fence.

Although about two hundred different styles of fences have been invented and patented in the United States within the past ten years, yet this Fence, for GENERAL FARM USE, stands at the head of the list. This is a Virginia invention, and the actual cost of the Fence complete in that State is less than fifty cents per rod. Three men can put up six hundred yards per day. You men who are idle, why hang about the city talking hard times when you can make from five to eight dollars per day building this Fence? We will make a present of ONE FARM RIGHT in each county on the Pacific coast to farmers who will erect one hundred rods of the fence in good style within thirty days after the privilege is granted. We wish to employ several working men to travel in this State and Oregon. Price of territory, and circular with full description of fence sent on application.

New Gas Light.

This Light takes the place of the Candle, the Kerosene Lamp and Coal Gas. Each Lamp is a perfect Gas Factory, making its own gas as fast as it is required. It is a safe, cheap and beautiful light. Circulars and full particulars sent on application.

A few good traveling agents wanted to sell this and other valuable Patents.

Hold Your Horses!

By the use of "Burns Patent Safety Bridle" the wildest horse can be controlled with ease. The mildest bit is used and the horse's mouth cannot be injured. No restive horse should be driven with any other bridle. Send for descriptive circulars, or call and see the Bridle. Shop Rights for Sale.

Hunter's Improved Grain Separator.

The best machine to Clean Grain in the world. Prices reduced. Send for descriptive circular and price list. County Rights for sale.

For Sale.

We have for sale the right to the Pacific Coast for the safest, cheapest, most compact and simple Engine and Hoisting Machinery for mining and other purposes ever invented. Although new it has been thoroughly tested and we have strong testimonials in its favor from many of the most successful men of the East. We invite manufacturers and others, to call at our office and make their own investigations.

WIESTER & CO.,
314 Bush Street, San Francisco.

E. A. FRIEND & CO.

COMMISSION PATENT AGENCY,
601 California Street, S. W. Corner Kearney.

Introduce and sell Patents and useful inventions on the Pacific Coast.

(ADDRESS LOCK BOX 660 P. O.)

For Sale County and Town rights for Patent Carpet Stretchers and Tacker. Large sales can be made, as every Family should have one.

NO MORE RUNAWAYS!

THE INDEPENDENT HORSE HITCHER!

Can hitch your Horses securely without Post or weight. County and Town Rights for sale. Call and examine it.

E. A. FRIEND & CO. 601 California Street.

Sheffield Scientific School

Of Yale College, New Haven, Conn.

This department of Yale College, instituted in 1840, and endowed with the National Land Grant in 1866, furnishes advanced instruction in the various branches of Mathematical, Physical, and Natural Science.

The School is under the direction of the President of the College, a Board of thirteen Professors in different specialties, and six assistant instructors.

Regular courses of study, leading to the degree of Bachelor of Philosophy, conferred by Yale College, are arranged as follows: 1—CHEMISTRY AND MINERALOGY. 2—CIVIL ENGINEERING. 3—MECHANICAL ENGINEERING. 4—MINING ENGINEERING AND METALLURGY. 5—AGRICULTURE. 6—NATURAL HISTORY AND GEOLOGY, and 7—SELECT COURSE. Advanced students are also admitted to optional courses, and if already College graduates, are received as candidates for the degree of Doctor of Philosophy.

Tuition, \$125 per year of forty weeks.
The Libraries, Museums, Laboratories and Apparatus accessible to students, are varied and extensive.
For copies of the Annual Circular and Report, letters may be addressed to the "Secretary of the Sheffield Scientific School," New Haven, Conn. 7v16 1y16p

Illustrated Reading.

An Hydraulic Improvement.

There are many practical difficulties experienced in hydraulic mining (as well as in other business) which trouble the operator a long time, and to obviate which various more or less complicated expedients are resorted to, until some one hits on an idea so simple that every one knows of it before, of course, only no one had happened to think of it.

Our correspondent, L. P. Mc., in one of his interesting letters about the hydraulic mines in Nevada county, gave a description of a little device which we think will interest many of our readers. The expansion and contraction of long pipes are so great that, when the lengths are firmly fastened together, the pipe twists and bends and often breaks. Now, in many localities, to get around this difficulty, the miners lay

the pipe in wavy lines, so that it forms curves, and thus has a chance to contract and expand without altering the position of the two ends of the whole pipe or causing serious trouble. But some bright miner (we have not his name) invented the device (here illustrated) for connecting the lengths of the pipe, and this our correspondent pronounces "the neatest and simplest device for the purpose in the country."

The two pieces, A A, of pipe to be connected are placed from four to eight inches apart and carefully enveloped with a piece of heavy duck, B, wrapped once and a half times around. Over this is wrapped a piece of sheet iron, from eight inches to two feet wide, provided with from one to three clasps, D, so constructed as to form a sloping key-hole fastened by a wedge-shaped key. In the cut one clasp is shown. The pipe-lengths can close up or open out inside of this device without doing injury or leaking. By introducing this connection every fifty or one hundred feet no trouble will be experienced from the contraction and expansion of the pipe.

RAILWAYS AND THE WAR.—The N. Y. Tribune correspondent says that more is expected of steam in this campaign than it will accomplish. The Eastern Railway used almost superhuman efforts to carry 400,000 men to Strasburg and Metz. It occupied fourteen days. A train can not convey more than one battalion, one squadron or a single battery at a time, or as a mean term, 500 men with their equipment. This would require 800 trains for a total of 400,000 men. It has demanded extraordinary efforts to convey this "food for cannon" to the frontier, and but for them four months would have been consumed in concentrating them there from Paris alone.

Curious Teeth.

Mr. George W. Thompson recently shot a ground squirrel on his ranch, three miles north of Brooklyn, Alameda county, whose mouth presented a queer sight. The two upper front teeth were elongated and curved

in a curious manner. One of them had grown in a complete circle, extending around about one and a quarter times, on one side of the head, while the other had curved up through the roof of the mouth and broken through the skull on one side of the nose. Mr. Thompson preserved the skull, which he brought to the office of the SCIENTIFIC PRESS, and an excellent representation of which our engraver's skill enables us to give to our readers.

The probability is that these did not

FIG. 1.

APPARATUS FOR SQUIRTING SOLID METALS.

originally fit with the lower teeth in the ordinary way and hence, not being exposed to the usual wear and tear, continued to grow until they assumed their present curious shape. Similar instances of the kind are by no means unknown, but we do not remember seeing any case quite as remarkable as this. Such instances are, however, extremely interesting and the specimen is worthy of a prominent place in any cabinet.

At the Colorado Fair, the first premium for the best collection of gold ore was taken by Boltail ore, and the second by Cons. Gregory, both at Central City. The first premium for silver ore went to the Cariboo mines.

JOSHUA E. CLAYTON has succeeded W. P. Holmes as Superintendent of the Original Hidden Treasure.

Malleability and Ductility of Metals.

LECTURE BY JOHN ANDERSON, O. E.

In order readily to understand the two remarkable properties of malleability and ductility, which are now turned to such good account in almost every branch of the mechanical arts, it will be convenient to think of the malleable or ductile metals, such as lead, tin, copper, wrought iron, and steel, as substances that can be moved about like dough, that can be spread out as with a roller, that can be elongated by drawing out with the hands, that can be squirt-

FIG. 3.

ed through a hole by pressure like macaroni, or even that the dough can be pushed or gathered back again into its original mass of dough—that is, if proper means

FIG. 2.

are employed to perform the operation gently, and this may be done without breaking the continuity of the particles of which the mass is composed. Such a statement may well seem fabulous, but it will be my province now to enumerate many things in connection with metal much more wonderful than what I have said regarding the dough, and even more strange than the change in dough when overtaken by the biscuit state from the baking process.

It is difficult to understand the possibility of the malleable and ductile properties without fully realizing that their particles are fluid, in a certain sense, and that this is due to the molecular arrangement, not so fluid as water, tar, or bitumen, but still a fluid which will flow in obedience to sufficient pressure; and just as those fluids require time when acted upon by gravity, so the metals require greater time and more

force than gravity, the rate of flow being determined by the nature of the metal, the softer metals requiring less pressure and flowing faster than the harder; and in the case of steel the flow is extremely slow, but with pressure, time and patience, it also may be overcome and made to flow gently into any shape or form while in the solid condition.

For a number of years the flowing property of the softer solid metals, such as lead and tin, has been taken advantage of very extensively, in the squirting of pipes and otherwise; and for thousands of years, the malleable and ductile metals have been under treatment by man, and a vast number of facts have thus accumulated; but it is due to M. Tresca, of Paris, to say that he has done more, perhaps, than any other man in regard to the investigation of the natural laws by which the flow of solids is governed under varying circumstances; and the most interesting point of all is the great similarity that exists between the flow of the solid metal and that of the flow of water, that in the flow of solids from an orifice there are the same converging currents, eddies, and that the quantity of metal issuing is dependent on the same conditions as water when issuing from orifices of different arrangement, and only differs in degree.

From time immemorial man has been familiar with gold as a flowing metal, both as malleable and ductile. It is in consequence of these properties that gold may be beaten into leaves so thin that it takes two hundred and ninety thousand to make one inch in thickness, or it can be drawn into a wire so fine that an ounce weight would extend a distance of fifty miles.—The flowing action which takes place in coining a sovereign or other coin is very apparent. This process is not the mere stamping which is generally considered to be, but the particles of the gold have really to flow in the same manner as a liquid, from one part of the die to another, in order to fill up the deeper recesses of the die from the shallow part of the space, and so form the perfect coin from the rush of gold penetrating everywhere. As, however, gold is not one of the most common metals of applied mechanics, its presence in the workshop is less seldom met with than some of the others which have been already enumerated.

The metals lead and tin are both malleable and ductile, but their malleability, or spreading out property, is much greater than their ductility, or drawing property; and both being soft, and having the flowing property in a pre-eminent degree, they can thus be squirted or rolled to any extent, or into any form of pipe or sheet, so that the want of ductility is scarcely felt.

The diagram (Fig. 1.) will explain the nature of apparatus which is employed to squirt these metals when in the solid state. It is a powerful syringe filled with solid metal, with pressure on the piston varying according to the dimensions; in some the force required is two thousand tons. In

Communications.

IN THIS DEPARTMENT we invite the FREE DISCUSSION of all proper subjects—correspondents alone being responsible for the ideas they advance.

Notes of Travel in Nevada County.

[WRITTEN FOR THE SCIENTIFIC PRESS.]

God's Country.

God's Country, so called by the miners, probably got the name from its lofty elevation, and the difficulty experienced in getting to it(?) It consists of that portion of the country lying between Washington and South Fork, the highest elevation of which is from 6,000 to 7,000 feet above the level of the sea, and is approached only (from either direction eight miles around) by grade of from 300 to 400 feet to the mile. In this section is the Jim mine and mill, owned by Loyd & Finley, of Grass Valley, and J. D. Lord, of Sacramento, and superintended by Thos. Loyd. They have been running a 5-stamp mill steadily for two years, crushing an average of 13 tons of rock every 24 hours; they employ about 20 men, have a well defined ledge from 2 to 4 feet thick, and have taken out an average of \$5,000 per month since they commenced, 50 per cent. of which is *net*. They have two short tunnels, but are now running one which, when done, will be 1,000 feet long, and will cost from \$3,000 to \$5,000. This will drain the mine for 150 feet below its working, and keep it dry for the next five years.

South Fork, once a very prosperous mining camp, is now almost deserted. The Birchville mine, at this place, has just completed new hoisting works, and will likely make it lively here this winter.

Eureka South.

Eureka South or Graniteville, as the place is also called, has in its neighborhood several mines which are yielding handsome returns to their owners. This district, once famous for its rich gravel mines, has been dormant for several years, but the existence of paying quartz ledges has made quite a stir there, and all that is needed to develop the claims is a few energetic and sagacious men with moderate capital.

The old Dillon mine, about 2 miles from Eureka South, was first located and worked about ten years ago, and quartz paying about \$24 per ton taken out. Notwithstanding, the owners fell in debt and the mine was not worked for a long time. About 2 years ago it came into other hands and work was recommenced, and the mine is now so well and thoroughly opened, a depth of about 170 feet being reached, that the value of the claim can easily be ascertained. Recently the further sinking was stopped as the owners intend to put up hoisting works which would reduce the expense of working the mine very materially. Messrs. Bandman & Neilson, agents of the Giant Powder Co. of San Francisco, are the proprietors, and L. Stuart is Superintendent.

The Norfolk and Mohawk mine near here, owned by San Francisco capitalists, and superintended by L. Stuart, has fine hoisting works, an incline shaft down 155 feet, and a ledge 4 ft. thick that pays \$12 per ton, and has paid as high as \$30. At present it is lying idle, but the company expect daily to proceed with the work.

The Rocky Glen Quartz mine, owned by Black & Irwin, M. W. Irwin, Supt., is situated 1½ miles south of Graniteville, and at present working 30 men. They have two tunnels, the longest of which is 1,025 feet, and strikes the mine at a depth of 220 feet. They have a 10-stamp mill, with which they crush 25 tons per day (24 hours); the rock averages \$8 per ton; the vein is 2 to 7 feet wide. There are many more mines here, all of which are considered valuable, awaiting the erection of mills.

Eureka South (Graniteville P. O.) although an important mining camp for the last 15 years, has never had the U. S. Mail brought there by the Government; the nearest point was Moore's Flat. I believe at the last session of Congress a bill was passed allowing them a tri-weekly mail, which will soon be let. Hon. A. A. Sargent has the credit of the bill.

Moore's Flat.

Moore's Flat is in Eureka Township, 8 miles south of Graniteville and 20 miles north of Nevada City. It was almost entirely burnt down in July, 1869, previous to which time it contained over 500 inhabitants. Now not half that number reside here. Several smaller camps surround it,—Orleans Flat and Snow Point on the north, and Woolsey's Flat and Jerico on the south, none of which is more than 1½ miles distant. The deep channel known as the North Bloomfield Channel, first makes its appearance at Suow Point, and from there extends through a dozen thriving mining camps. Jerico is a small camp just started midway between Woolsey's and Moore's Flat, and is destined to be a place to hail from, and not be sent to. The

principal claims here are the Illinois, Keegan Williams & Co., proprietors; Eagle, Mowrey & Co., proprietors; Paradise, Knotwell & Atwater, proprietors. The last named was once a drift claim, now worked by hydraulic process, but just at present is lying idle for lack of capital to put the proper machinery upon it. Several other claims have been temporarily suspended, awaiting the decision of the law suit pending in reference to Monitor infringements.

Marks & Co., bankers at this place, buy nearly all the gold dust, and ship about \$25,000 monthly. I am informed that, a few years ago, this same house shipped from here over a million dollars annually. This ridge is the best watered of any in the State. The Eureka Lake Consolidated Water Co.'s ditch cost \$2,000,000. The head office is in New York. The North Bloomfield Water & Mining Co. (of which I will write in my next) has spent something like \$800,000.

Relief Hill.

Relief Hill, distant three miles southeast of North Bloomfield, and seven miles from Moore's Flat, is a thriving mining district, with a deep gravel deposit mined by hydraulic process. The proprietors of the mines of this locality are deserving of great credit for the energy and perseverance which has characterized their labor for the past few years, giving them deep bed-rock tunnels, which now furnish sufficient fall for the successful working of the mines. The principal mining companies here located are as follows:

Union Company, B. E. Reasoner, foreman, employs ten men in drift and hydraulic diggings, and yields about one ounce daily to the man employed.

Situated next above the Union, is the Eagle Company, Thomas Conn, foreman, giving employment to ten men. This company have the longest tunnel in the hill, the same being 1,500 feet in length, 80 feet below the bank of gravel now washed. But they expect better yield of gold further back in the hill, as they are not now over the main channel. Hope they may strike it big.

The What Cheer company's mine is above the Eagle. This company employs about 15 men, and has run drifts further into the hill than any other company, and found such prospects, as to guarantee the purchase, a few months since, of adjoining ground, paying therefor \$12,000.

The North Star mine, belongs to the Eureka Lake Ditch Company, is situated on the same channel, next above the What Cheer, and is said to be paying well.

It is the writer's opinion that the mines in this locality are good, and will return first-class dividends in the future. L. P. Mc.

Bull Run District.

[WRITTEN FOR THE SCIENTIFIC PRESS.]

Editors Press:—Our district is progressing satisfactorily. The population is increasing, two coming to one who goes out. Improvements have been made in many respects. A town has been laid out and a number of lots have been sold. This camp has many advantages. In ascending White Rock Canyon, which is on the west side of Bull Run Mountain, you follow up a good stream which affords about 500 inches of water, and on each side of which abundance of timber is to be found. Up about two miles, you come to the town of White Rock (as yet a small mining camp, but growing rapidly) where there is a flat of about 160 acres with good accommodations for a mill. Almost all the principal mines are on the west side of the mountain with a down grade to the mill site. The stream continues up to within a mile of the highest peak, which is nearly 11,000 feet above the sea. The Porter mine is 9,000 feet up.

The mines are looking better than ever. The Blue Jacket has a tunnel in 100 feet, and a shaft down 54 feet on the vein and in good milling ore all the way. The width of the ledge has not yet been determined, but appears to be at least 25 feet wide. Ore shipped hence to Reno nets \$140 per ton. The Johnson mine lately struck a rich streak which assays all the way from \$1,000 to \$18,000. This streak is 4 inches wide and grows wider as it descends. The mineral is almost pure black sulphuret of silver. The streak is on the lower part of the ledge, which is 4 feet wide and is of the same general character, only not so rich. Some average rock yielded \$26 gold and \$77 silver, or \$103 in all, per ton.

The long-felt want of the district is now about to be supplied in the line of mills. Mr. P. F. Davis (formerly of the Utica mill) is about to erect a 5-stamp mill here, and a Mr. Crosby, of Chicago, is preparing to erect a 20-stamp mill. We have plenty of mines to keep these running constantly. The only drawback is that the miners generally are poor men, without sufficient capital to carry on operations until they can get returns from their ores. The mills, however, will render it possible to push things on a larger scale. The ores will require roasting; but still, with the mills in operation, we shall be able to demonstrate to capitalists that there is a good field open for their inspection. BULL RUN MINER.

September, 1870.

All About Montana.

[WRITTEN FOR THE SCIENTIFIC PRESS.]

Ens. Press:—Having business in Montana, I thought it would be well to keep your readers posted as to what I might see and hear while passing through the various mining camps of the New North West. I last wrote you from Corinne, and now am writing from Helena.

The Stage Line.

I came on by the line of Gilmer and Saulsbury, making the distance of 462 miles in 4 days and 3 nights. This used to be the old Overland Stage Company's line, and Wells, Fargo and Co., had it, but the present proprietors purchased it of the latter firm in 1869. Mr. Gilmer was formerly a stage-driver on the route, but distinguished himself so much as to get to be a division agent, being intelligent and capable. The good quality of the road surprised me. There are 42 stations between Corinne and Helena, and 500 horses are at work daily, 50 extra ones being kept for changes, etc. The number of agents, drivers and stock tenders on the main road amounts to 70. The company carry Wells, Fargo's mail, and have contracts for carrying the U. S. mails over some 1,500 miles. They also run a line to Fort Benton (140 miles) three times a week, employing here 100 horses; likewise a branch road to Virginia City from Moies station (on the main road), a distance of 28 miles; and a line, 25 miles long, to Bannock, a flourishing mining place. Their division agents are D. W. Robbins (from Corinne to Ryan's station), E. M. Pollinger (from Ryan's station through Helena to Fort Benton), and W. H. Taylor (from Helena to the Cedar Creek mines), all of whom I found careful and competent men. On this line are the best stables of the kind which I have seen, with good accommodations for hostlers and horses. The road was well stocked, the time made was good, and the treatment I received was excellent.

Helena.

In July, 1864, John Cowan discovered the Last Chance Gulch, one of the most remarkable in the Territory, in which this town is situated. Numbers flocked to the place, which had a population estimated at 8,000 in September, 1866. But other excitements have drawn people away, although the mines here are still worked, and the census now allows the place 3,713 inhabitants. Some two years ago the city suffered terribly from a large fire which destroyed the business portion of the town, but the energy and enterprise of the people were quickened thereby, and the town was soon rebuilt with substantial buildings of brick and stone. There are now two fine large hotels, the International and the St. Louis, a large Court House, a theatre, a National Bank and three others doing a large business, etc. Considerable is done in the line of manufacturing jewelers, and I have seen some beautiful work with moss agates, which are so abundant in the Territory.

A most creditable thing for the city is the Helena Library Association, which has a cabinet of curiosities, keeps a complete file of weekly papers from different quarters, etc., etc. That such an institution should be sustained, speaks well for the people here.

The foundry and machine shop of Hendrie & Co., manufactures all kinds of quartz mill machinery, does job work of varied description, and is a well conducted affair. It is well arranged and turns out good work, better probably than you think down in your city, for the managers understand their business and take a pride in their work. Business is not particularly brisk just now, but people hope for livelier times soon.

There are two well-established journals published in this place. The *Daily Rocky Mountain Gazette*, published by Wilkinson, Ronan & Co., is ably edited by E. S. Wilkinson and M. Maginnis. It is an enterprising sheet, as is shown by the fact that the proprietors have just bought a fine steam engine and will hereafter print their paper by steam power. This is the first steam printing press in the territory, and the first sheet printed thereon was sold, at auction, for the sum of \$105, to Mr. G. E. McKiernan of the city. The driving shaft, pulleys, etc., of the 10-horse engine were constructed by Mr. Bateman at Hendrie's foundry. Mr. Sam Richardson started the first steam press in California and Nevada, and also in this territory. The other paper is the *Daily and Weekly Herald* and is edited by Mr. R. C. Fisk. The proprietors intend to keep up with the progress of the times, and have already purchased the engine and machinery in order to quickly follow the lead of their neighbor.

The Fair Association.

A most important body is the Montana Agricultural, Mineral and Mechanical Association, organized for the purpose of "acquiring, holding and improving grounds in the vicinity of Helena, upon which to hold Territorial Fairs, and for other purposes." The officers are J. F. Forbis, President; C. Hedges, Vice President; E. W. Carpenter, Secretary; and D. C. Corbin, Treasurer. The first annual fair will be held towards the end of September, when some \$10,000 are offered in premiums. The fair grounds are on the Patterson Ranch, 3 miles north east of the city, and comprise some 80 acres, with trees and water, forming, I understand, a beautiful place for the purpose. I hope it will be a success. Such associations, under proper management, stimulate to renewed exertion by showing what has been done, what is done, and much of what probably can be done. Success to the fair!

Mining—Shipments.

Mining near the city is somewhat limited, but few claims being worked at present. Water has been very scarce and this has stopped work to a great extent. But the "Park Ditch" is being constructed, and it is hoped that next season the gulches will be supplied with water. Holtis & Brothers have now a mill at work sawing lumber near the line of the ditch, and its speedy completion is to be hoped for.

I visited the claims of Taylor, Thompson & Co., near the city. Here some 60 men are employed night and day and the deposit is worked down some 22 feet. In order to get the necessary fall, the gravel must be hauled up (two) inclines, 300 feet long, and thence dumped into the sluice boxes. The engine is 15-horse. The claims are very remunerative, as I am given to understand.

The next claim visited was that of Getchell Bros., about a quarter of a mile below the one just spoken of. Here 45 men work day and night, and bed rock has been found at a depth of 25 feet. The gravel is hauled up inclines for washing, as just mentioned. Near this is another large claim where no work is being done.

From this centre (Helena) large shipments are made. One day last week S. H. Bohm & Co., one of the principal banking houses here which does a large business and has branches in various parts of the territory, shipped one brick valued at \$41,859. During the month of July, the shipments of this one firm amounted in the aggregate to \$248,730. E. H. Wilson & Co. have just made a shipment from California of 75,000 lbs. of rice, beans, groceries, provisions and wines. These are but single items; but Helena does a large trade and is a commercial centre for the territory. Freight charges I may add, from San Francisco to Corinne are 1½ cents per lb., and from Corinne to Helena, 3 to 3½ cents. Most of the goods, however, come from the East.

Unionville.

This is a small town located about 4 miles south of Helena. The most prominent lode is known as the Whitlatch Union vein, running almost at right angles with, and crossing near the heads of the placer gulches in the immediate neighborhood of Helena. This was discovered in the winter of 1864 and has produced more gold than any other in the territory. The country rock is granite, and a short distance to the north is a belt of limestone. The width varies from 2 to 11 feet. The ore is a splendid looking quartz containing gold holding a small percentage of silver. Iron and copper pyrites occur and tellurite of gold has been found in considerable quantities.

The Columbia M. Co. have 35 men at work and are taking out 30 tons daily. They have 2,500 tons on the dump. Labor being higher in summer than winter, operations are apt to be on a larger scale during the winter months. They have a fine 30-stamp mill running day and night and working an average of 1½ tons to the stamp in 24 hours; but only 20 stamps are crushing at present. There is considerable difficulty in getting a sufficient supply of water. There are 3 pair of Hungerford's pans and 2 settlers. Eleven men are employed. The tailings assay \$40 and yield \$25 in the pans. The bullion averages 75 per ct. gold, 20 per ct. silver and 5 per ct. copper. The hills are heavily timbered and wood costs \$4 to \$5 per cord delivered at the mill. I give (as an example) the result of 9½ days run: Date of clean-up, Feb. 21, 1870. No. tons crushed, 217; per day 22.9. Weight of bullion before melting, 696.34 oz. Troy; after melting, 636.18. Fineness, 767½. Value of gold, \$10,093.41. Yield per ton, \$46.51. A 7½-days run, ending Aug. 11th, of 200 tons yielded \$4,470.85 or \$22.35 per ton. The General Superintendent is B. H. Tatten, and the Assistant Superintendent is M. S. Seip.

The National Mining and Exploring Co., of New York, are putting up large hoisting and pumping works, their mine being full of water. They have an 8-inch Double Plunger Lifting Pump, and two portable engines of 8 and 15 horse power. The building is of stone. Their mill, about the first built in this section, has 20 stamps with copper plates and no pans. They have a compound engine of 25-horse power. The mill is not going at present. Mr. Allen Danforth is General Superintendent.

C. Hendrie and Co. have a location on this same lode and are at work, with 20 men, in ore averaging \$15 to \$20 per ton, after having gone through 200 feet of poor rock. They have to raise 1,000 gallons of water daily and the amount increases as they go down. They have a 20-stamp mill, run by a 20-horse power engine, the machinery having been made at Hendrie's foundry, of which I have previously spoken. I believe that they are making money. Mr. Hendrie has been engaged in business in former years in Colorado and Montana, and is a Pioneer here. He is noted for his energy, perseverance and ability, and as he generally makes a thing go when he has put his shoulder to the wheel, I have no doubt but what he will be successful here. He certainly deserves to be.

Grizzly Gulch.

At Grizzly Gulch, one mile west of Unionville, are several quartz mills, idle at present, but probably to be at work in the winter. The I. X. L. Co. have a shaft down 330 feet, and a 20-stamp mill, with over 1,800 cords of wood on hand. The Diamond City mill, situated in the same canyon, is also idle at present. S. S. Harvey is the Superintendent.

About the famous Cedar Creek mines, whither I am now going, I shall shortly have something to say. W. H. M.

Helena, September, 1870.

Mechanical Progress.

NON-RIGID SUPPORTS FOR CYLINDRICAL BOILERS.—We find in *Engineering*, a paper prepared by Jeremiah Head for discussion at the Iron and Steel Institute, in which is described a method of obviating one of the chief objections to cylindrical boilers viz. the liability to "break their backs." We quote:—"It consists in so arranging the supports of the boiler, that they follow it through each change of form without materially increasing or relaxing their hold. The cast iron hearers are retained, also the suspension rods, but the latter are lengthened; and the ends upon them, instead of resting upon the hearers, rest each upon a volute spring encircling the suspension rod, and seated upon the bearer. The boiler rests upon 9 volute springs, each carrying 1½ tons, with a compression of 1½ in., and is entirely free of other support. Except upon yielding supports, it is quite impossible to support long structures subject to great alterations of heat, without ultimate damage. Only two difficulties occurred in carrying out this plan in practice. The first was, how to prevent breakage of the various connexions with the mains. Inasmuch as the boiler was now free to rise and fall, and change its form according to circumstances, the steam, feed, and sludge branches connected with their respective mains might be expected to snap off. But this difficulty was met by simply adopting circumferential instead of direct connexions. The second difficulty was this. It is obvious that if 1½ tons each were resting upon the volute springs, each one must be exerting constantly an upward force to that extent. But at the end of the week, when the water constituting ¾ of the whole weight was allowed to run off, the springs would certainly lift the boiler so lightened out of its position to a proportionate extent. The boiler lifted, the brickwork would be loosened, and leaky flues would be the result. But this danger was overcome by inserting between each bearer and the top of the boiler, and fixed to the latter, two adjustable set bolts, called *gags*, which permit a certain rise, and then come in contact with the bearer, stopping further lifting by the springs."

A NEW HORSE SHOE MACHINE.—The Providence Journal of Sept. 23d gives these notes of a machine invented by a mechanic of that city. "The iron of which the shoes are made is rolled to required dimensions for the several sizes in bars about twelve feet long, with indentures for the nails, each bar divided into ten shoe shapes. These bars are heated in a long furnace to a white heat, and passed directly to the machine, which works two bars at a time, requiring two men to feed the bars to the machine with iron tongs. The process of cutting off, thickening the heels, forming the shape around the dies, and making the concave on the back of the shoe, is rapidly and perfectly performed by one operation of the machine, and the shoe drops into an iron receptacle completed, with the exception of punching the nail holes, which is performed afterward by machines specially adapted to that purpose. The new machine above described weighs five tons, requires four horse-power to run it when in full operation, and has the capacity of making one ton of horse shoes per hour."

IMPROVED CAR WHEEL.—The Philadelphia correspondent of the *Iron Age*, Sept. 29th, thus describes a car wheel recently patented: "The wheel is cast in three parts—the hub, the web, and a plate to which the hub is bolted. Between the axle and the hub is a ring of solid rubber, three inches wide and one inch thick. The effect of this arrangement is that a sudden blow on the web is communicated to the rubber, and thence to the axle. For this wheel it is claimed that it is cheaper, safer, and more comfortable. It reduces the jar to a minimum. In rounding curves the oscillation is scarcely noticeable, and the noise is deadened."

A NEW GOVERNOR.—*Engineering*, of London, illustrates Bourne's Spherical Governor. It consists essentially of an elastic hollow ball, made of brass 1-16 of an inch thick, in segments, and so arranged that when the engine begins to "race," the centrifugal force causes the ball to take the form of an oblate spheroid. As the lower pole is fixed, the motion takes place at the upper, depressing the spindle and closing the valve in proportion to the increased speed.

THE MISTAKE OF THE STEEL MAKERS.—W. Mattieu Williams says, in *Nature*, that the advocates of steel making processes have acted upon the idea that all that is necessary is to have a certain percentage of carbon in the product. Bessemer himself, at first, expected to stop the decarbonization at the proper moment, leaving the necessary proportion of carbon to make steel of the pig iron. In this way he failed to make good steel; and the failure was attributed to the difficulty of determining the right moment to stop the "blow." For this reason it was, that the plan of first completely eliminating the carbon, and then adding a known percentage of it by means of spiegeleisen, was adopted. The fact really is, however, that the carbon must be wholly removed, from English pig-iron, in order that the other impurities may be got rid of. If any phosphorus, sulphur, or silicon remain, the product is unfit for steel purposes. Not even Dr. Percy alludes to the necessity of complete decarbonization as a means of removing the silicon. It is not the superior skill of the Swedish steel makers that enables them to produce steel directly by the Bessemer process; but the fact that they have a different material to start with.

ELLERSHAUSEN.—Of this American puddling process, which was sometime since described in the Press, London *Engineering* remarks as follows, while noting a recent trial of it at the Dowlais Iron Works, in presence of the members of the Iron and Steel Institute:—"The difficulties which present themselves under the actual conditions of work carried on upon a large scale are very considerable. It is not possible to select materials so as to be under perfect control, and properly proportioned to each other in quantities and qualities of all the different elements and compounds which must be simultaneously acted upon in order to produce the desired result. The temperature of the liquid iron is not favorable to the reduction of the powdered ore, and the presence of a considerable quantity of silica which will be found in the majority of the richer iron ores in this country will materially affect the wished-for results in the subsequent processes, and it is more than probable that the ultimate results will be the production of a large amount of black cinder or slag, being a rich silicate of iron, and containing probably all the iron belonging to the ore, and some further addition of iron which must have been abstracted from the pig iron itself in a complicated manner. * * In any case the process is still in its first stages of experimental progress, and cannot aspire to be ranked among the practical realities of iron metallurgy, so far, at least, as its application in this country is concerned."

HOT BLAST FOR BLOW-PIPE USE.—W. Skey has experimented with the hot blast in place of the usual cold one, in the production of the blow-pipe flame. The effect was remarkable. He gives some results in the *Chemical News*, from which we quote: "The temperature of the blast was approximately, 500° Fah.; the diameter of the jet, regulating its issue, was one-thirtieth of an inch; the combustible for receiving the blast was acetone. This flame manifested a very marked superiority over the common blow-pipe flame; substances difficult to fuse in the latter, magnetite, potash-felapar, mica, readily yielded under these circumstances; while thick glass tubes, half an inch in diameter, and hard German glass tubes were tractable to an eminent degree. Carrying my test experiments still further I found several substances for the fusion of which the oxyhydrogen flame or some equivalent of it in heating power is said to be indispensable, also yielded before the blow-pipe flame thus urged; for instance, platinum, pipe clay, fire clay, agate, opal, flint. Several samples of each were tried, and always with the same results; it could not well be, therefore, that the fusibility of any of these substances was due to the accidental presence of foreign matter in more than usual quantity. * * The results of these experiments urge me to recommend for trial the substitution of heated air for oxygen in most of those cases where this gas is now employed in conjunction with hydrogen or other combustible matter as a generator of heat or light; for instance: 1st. In the metallurgy of platinum that part of it where the metal has to be fused; also in soldering platinum stills for sulphuric acid works. 2d. The fusion of alumina in the manufacture of certain gems. 3d. In the production of the Drummond and Bude lights."

Scientific Progress.

THE EXTINCT ELEPHANT ON THE YUKON.—The following is from W. H. Dall's new book on Alaska:—"I picked up near the village a large portion of the skull of the extinct elephant (*Elephas primigenius*). These bones are not so common as the teeth and tusk, being found on the surface only, and usually much decayed; while the bones of the musk-ox and fossil buffalo found in the same situations are much better preserved, and sometimes retain some of the animal matter in the bone. The natives have no tradition of any other large animal than the reindeer and moose, and regard the elephant and musk-ox bones as the remains of dead 'devils.' The tusks are not so well preserved as those found in Siberia, which are usually buried in the earth."

MAGNETISM AND SURFACE ACTION.—The following experiment is described by Prof. A. M. Meyer in an article entitled "Researches in Electro-Magnetism" published in the *Am. Journal of Science and Arts*, for September:—"About 200 1-20 inch wires were pressed together as tightly as could be by binding them in a bundle with silken cord, and the deflection they caused in the needle, when magnetized in the helix, noted; they were now taken apart and bound as tightly as before around a wooden cylinder about 1 inch diameter; and being magnetized again in the helix with same strength of current, the bundle caused a far greater deflection in the needle than when it acted without the central wooden cylinder. I consider this experiment as very conclusive of the surface action of magnetism, for in the two measures we used one and the same mass of metal, subjected to exactly the same magnetizing influence, and only differing in the extent of exterior surface existing during the two experiments."

PREHISTORIC ARCHEOLOGY IN GREECE.—A letter from George Finlay, LL.D., at Athens, is given in *Silliman's Journal* for September. The writer has made explorations in many parts of Greece, and the Archipelago, and found everywhere chips of obsidian, similar to those which have been picked up on the tumulus at Marathon, and supposed to be Persian arrow-heads. He has at various times published notices of these; and he has since collected several specimens of stone implements, such as axes, chisels, etc., similar to those found in the Swiss lake dwellings. He suggests the importance of explorations for traces of the lake dwellings described by Herodotus as existing in Macedonia. We quote the concluding paragraph of the letter:—"The stone period has been divided into a paleolithic and neolithic period. In western Europe, particularly in France and England, numerous remains of stone implements of the paleolithic period have been found in strata with the bones of the mammoth and other extinct animals. But I am not aware that any stone implements that can be attributed with any certainty to this period, have yet been discovered in Greece, though bones of these animals have been found in several places in great quantities both in Attica, Euboea and Arcadia. All the stone implements that have fallen under my notice consist of specimens that belong to the neolithic or polished-stone period, and many display considerable skill in their workmanship, being composed of the hardest stones."

ATOMIC WEIGHTS OF THE EARTHLY METALS.—The University of Göttingen offers a prize of 500 thalers, until Aug. 31st, 1872, for the best essay containing a "new and exact determination" of the above. A critical revision of previous investigations in this direction is required at the same time. "Theories upon the constitution of matter have yielded no lasting results. An induction from the results of many exact investigations is needed, in order to answer the question, so important for philosophical interests of the most diverse character, whether the known chemical elements are to be regarded as originally different substances, or as derived in some manner from the same fundamental material, and how, in both cases, the formulae which would express their characteristic properties are to be arranged as members of a series. The most important preface to this induction is the exact determination of the atomic weights of these elements."

THE CRITICAL TEMPERATURE OF GASES.—The following, upon a subject to which we have before alluded in the Press, is from the opening address of Prof. Roscoe, F.R.S., before Section B, of the British Association on the 15th ult:—"No opinion would appear to have been more firmly established than that of the existence of three separate states or conditions of matter, viz., the solid, the liquid, and the gaseous. A body capable of existing in two or more of these states was thought to pass suddenly from one to the other by absorption or emission of heat, or by alteration of the superincumbent pressure. Dr. Andrews has shown us how false are our views on this fundamental property of matter, for he has proved that a large number of, and probably all, easily condensable gases or vapors possess a critical point of temperature at and above which no increase of pressure can be made to effect a change into what we call the liquid state, the body remaining as a homogeneous fluid; whilst below this critical temperature certain increase of pressure always effects a separation into two layers of liquid and gaseous matter. Thus with carbonic acid, the point of critical temperature is 30.92 deg. Cent., and with each given substance this point is a specific one, each vapor exhibiting rapid changes of volume and flickering movements when the temperature or pressure was changed, but showing no separation into two layers. Under these circumstances it is impossible to say that the body exists either in the state of a gas or a liquid; it appears to be in a condition intermediate between the two. Thus carbonic acid under the pressure of 108 atmospheres, and at 35.5 deg. Cent., is reduced to the 1.430th of the volume which it occupies at one atmosphere, it has undergone a regular and unbroken contraction, and it is a uniform fluid; if we now reduce the temperature below 31 deg. Cent. the liquid condition is assumed without any sudden change of volume or any abrupt evolution of heat."

CORRESPONDING FORMS OF SELENIUM AND SULPHUR.—Rathke places the insoluble black selenium with the rhombic variety of sulphur, and the red amorphous selenium with the insoluble amorphous form of sulphur. As in the case of sulphur, the latter variety of selenium is produced by the decomposition of selenidionates (solutions of selenium in alkaline sulphites) by acids; by the action of water on selenium chlorid; and by the sudden cooling of fused selenium. So on the other hand, by the slow decomposition of a solution of potassium selenid, distinct crystals of black selenium are produced, precisely as when by the similar decomposition of alkaline sulphides, large rhombic crystals of sulphur separate. Though red selenium is more stable than the corresponding form of sulphur, yet, like this, it passes into the other variety on raising the temperature to 100° C., with a distinct evolution of heat. The specific gravity of selenium in these forms, is as follows: For the black variety, 4.80 to 4.81; the red, crystallized from carbon disulphid, (and corresponding to monoclinic sulphur), 4.46 to 4.51; the red, amorphous, 4.26. Agreeing here, also, with the corresponding forms of sulphur.—*Ann. Ch. Pharm.*

THE LAURENTIAN GRAPHITE OF ORGANIC ORIGIN.—Dr. Dawson thus concludes a paper upon this subject:—"We may sum up these facts and considerations in the following statements:—First, that somewhat obscure traces of organic structure can be detected in the Laurentian graphite; secondly, that the general arrangement and microscopic structure of the substance corresponds with that of the carbonaceous and bituminous matters in marine formations of more modern date; thirdly, that if the Laurentian graphite has been derived from vegetable matter, it has only undergone a metamorphosis similar in kind to that which organic matter in metamorphosed sediment of later age has experienced; fourthly, that the association of the graphitic matter with organic limestone, beds of iron ore, and metallic sulphides greatly strengthens the probability of its vegetable origin; fifthly, that when we consider the immense thickness and extent of the Eozoic and graphitic limestones and iron-ore deposits of the Laurentian, if we admit the organic origin of the limestone and graphite, we must be prepared to believe that the life of that early period, though it may have existed under low forms, was most copiously developed, and that it equalled, perhaps surpassed, in its results, in the way of geological accumulation, that of any subsequent period."

Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

California.

ALPINE COUNTY.

ITEMS.—*Miner*, Oct. 1st: The casing of the Tarsbish lode has been struck in Silver Glance tunnel.... Ore of low grade still encountered in Monitor No. 3. As great depth is being attained, the grade it is thought will improve soon.... Active operations are soon to begin on the Globe, and on a mill therefor. Mr. White, the inventor of the new chloridizing furnace, is expected in a few days with the President.

BUTTE COUNTY.

GOOD CLEAN UP.—*Oroville Record*, Oct. 8th: Gaskill & Bowers made a clean up on Ohio Flat, Friday last, which netted \$16,000. They have been running a tunnel for some time, and this is their second clean up.

LAST LOAD.—The last load of iron pipe for the Spring Valley Water Co., at Cherokee, will be placed on the wagons at the depot this morning. The work of laying will probably be completed in a week or two.

RIVER.—The river claim of Russ Johnson & Co., on the North Fork, is being worked, with rich dirt in depth from 8 to 20 feet. J. & Co., flume the North Fork every Summer.

EL DORADO COUNTY.

GOLD DUST.—*Placerville Democrat*, 8th: There was shipped through Wells, Fargo & Co., during the first week in this month, gold dust to the amount of \$11,715.

INYO COUNTY.

KEARSARGE MINE.—*Independent* Oct. 3d: This is upon the almost vertical face of the mountain, giving it the best position for working to great depths through short tunnels, obviating all need for boisting works. The tunnel from which came the main portion of the rich ore that has been worked, is near the summit of the ridge and at an elevation of 4,000 feet above the valley. The lowest of the three tunnels, a thousand feet below this, was in 250 feet, when recently a 3-foot ledge was struck which is all milling ore assaying from \$100 to \$2000 per ton. The ore from the upper tunnels is loaded on mules from the dump at the middle one, and packed down a two-mile trail to the mill 2000 feet below in the canyon. The mine is in good shape. The shipment of fine bullion per Express last week, was 3,720 ounces.

CERRO GORDO.—The new reduction works of Mr. Beaudry, started up Thursday. The furnaces have been steadily running since, and are producing 80 to 100 bars per day.

BELSHAW.—There have been hauled from Belshaw furnace 1,800 bars of lead down to the lake, for loading down ward-bound teams. There are about 1,000 more at the works, and the number is increasing at the rate of 100 each day.

KERN COUNTY.

HAVILAH.—*Cor. of Tulare Times*, Oct. 8th: The Jo, Walker never looked so well as at present. The new shaft is now 300 feet below the surface, and fifteen or twenty below the old works. In the bottom is a ledge, seven feet in width, of pay rock which exceeds in richness anything yet taken from the mine. The St. John's mine, at Sage-land, has been steadily paying for some time. A steam pump is needed and measures have been taken to procure one. The Esmeralda mill is still idle for want of water. At Kernville, one mill is running on surface rock from the Big Blue which yields only three dollars per ton, but the ledge is enormous, and is being worked by an open cut sixty to one hundred feet in width. The gold is so generally diffused through the mass that there is no waste rock. McKidney has returned to take charge of his works near Havilah. This property was sold to Dalton two years ago on conditions which were never complied with.

NEVADA COUNTY.

PINGREY MINE.—*Transcript*, Oct. 5th:—This is at the mouth of Canyon Creek. The ledge is eight to fifteen feet thick, and is opened up 55 feet. The rock by mill process has prospected \$200, and selected rock \$1,200 to \$1,500 per ton. Messrs. Pingrey & Boshow have 60 tons ready for crushing. They have purchased the five-stamp mill, on Orleans ledge.

SOUTH YUBA GRAVEL CO.—Same of 7th: This Co., having found prospects in their shaft as high as \$150 to the pan, will begin immediately to run drifts in different directions into the gravel.

ALISON RANCH.—Captain J. D. Woodworth, now superintendent, has started in to thoroughly open the mine to the depth

of 800 feet below the surface. The work is to be done by contract. A cross cut is being run as a starter. Captain W. is putting in a 15-inch plunger and will take out all the pumps now used except the 16-inch pump. The mine is looking first rate. A complete survey and map are to be made.

KANSAS.—Same of 8th: This Co. has found excellent prospects in the gravel at the bottom of the works. Jerry Brown washed from one pan 75 cents. The ground contains boulders, and they are prospecting for clearer ground.

EUREKA TOWNSHIP.—Same of 11th: We learn that in the flat just above Orleans, indications for rich gravel mines more promising than ever, have been found recently.

THE RIDGE.—*Gazette*, 3d: Recent prospecting by the South Yuba and Filibuster companies prove that a very large gravel channel runs directly up and down the ridge, at and above Hennefauth's. On each side the bed rock rises high, pitches into the hill, and encloses the channel. The South Yuba Co., on the north side found bed rock 95 feet from the surface with a prospect of four bits to the pan from the gravel, at a distance of 400 feet up the ridge from the rim; the Filibuster struck the bed rock also, and obtained as good a prospect from the gravel at the bottom. The Lower stratum is three to eight feet thick, and can only be worked by drifting. The volcanic deposit over the channel in some places must be four or five hundred feet in depth. The channel can be tapped and worked by tunnels from the north side. The Filibuster already have a tunnel in 240 feet, and 100 more will carry them to the channel. The South Yuba, estimate that 400 feet will reach the lower gravel in their claims.

SURVEY.—Same of 6th: J. Currier, has made a survey for a bed rock tunnel for the North Bloomfield Gravel Co., to be 4,800 feet in length, and strike the claims 200 feet below their present level. The estimated cost is \$150,000, and the time necessary three to five years.

SALE.—Same of 7th: The Sailor Flat gravel claims at Blue Tent, owned by Felton & Tomer, have been sold to Peck & Co. for \$5,300. The claims have been worked since 1855, and will last twenty-five years.

GOOD RUN.—*Grass Valley Union*, Oct. 8th: The North Star mine yesterday gave a second melting for its month's run. Gold to the value of about \$13,500 was put into bars. The under ledge is evidently the main gold bearer.

EMPIRE MINE.—Same of 9th:—We have authorized information that the hoisting works will be immediately put in repair, and the machinery will commence to run at a very early day.

WEBSTER & CO.'S CLAIMS.—The gravel is looking well. The Co. are running in bed rock, and leaving the gravel over-bed. A washing of the bed rock taken up has been made, and considerable gold was taken out. We saw a chipa weighing 12 dw. which came out Friday.

DROMEDARY MINE.—Same of 11th: The ledge in the bottom of the shaft is 2½ feet thick and full of sulphurets, with an occasional sprinkle of free gold.

EUREKA MINE.—About \$18,000 were cleaned up for last week. This on the first week of its sixth year, while settlements were being made. Under-ground, everything looks well.

PLACER COUNTY.

COLFAX.—*Cor. of Stars and Stripes*, Oct. 6th: The Rising Sun claim has a 5-stamp mill, a shaft 300 feet deep, and several tunnels on the ledge at different levels. From the eastern drift of the 300-foot level, rock of high grade is now being taken. The ledge is at that point from 18 to 24 inches thick. Since operations commenced, in the spring of '68, some \$65,000 has been taken out, which with the assessments makes the amount expended \$96,500. At regularly alternating and about equal intervals, they have had quartz of great richness—ranging from one hundred to five hundred dollars per ton—but between these the rock is almost absolutely barren. The Montana claim is on a ledge 300 yards from the Rising Sun mill. The Co. has bought the Mountain Co.'s mill at Forest Hill, and will put it up at once on their ledge, which is 4 feet thick.

SAN BERNARDINO COUNTY.

FOR CLARKE DISTRICT.—*Guardian*, Oct. 1st: A large number of strangers have been in town during the past week, on their way to these mines. Many have left, and others follow in a few days. The news is enticing.

SHASTA COUNTY.

SOUTH FORK.—*Courier*, Oct. 8th: Several parties from the lower country have visited the South Fork mines within the last few days, and may shortly obtain interests in one or more of the prominent ledges.

TRINITY COUNTY.

THE SHAFT.—*Journal*, Oct. 1st: The prospect shaft is down one hundred feet. The last forty feet has been sunk through a blue gravel, sometimes cemented.

QUARTZ MILL.—Silcox, of Indian Creek, has succeeded in making arrangements with parties at French Gulch to put him up a five-stamp mill, to be run by water. It is said that the rock now being taken from the ledge he intends working, will pay upwards of \$1,000 to the ton.

TRINITY RIVER FLUME.—A company of Chinese have put in a flume in the canyon below North Fork, that carries the whole of Trinity river. Three pumps are required. The Chinese say that the pay dirt prospects six bits to the bucket. White men who are posted say there is dirt that will pay one hundred dollars to the pan. The flume is twenty feet wide and four hundred feet long. The company numbers eighteen but they employ eighty more.

JUNCTION CITY.—During a recent visit, we noticed that the miners were all preparing for winter. Scarcity of water has been a great drawback to that section, so the boys are doing their best to get ready in time.

YUBA COUNTY.

BURNED.—The Grass Valley Union of 11th says: The quartz mill and surrounding buildings belonging to J. McKinstry Smith and Co., at Long's Bar, were burned on Wednesday last. The mill had not been running for some time, and it was no doubt the work of an incendiary.

SISKIYOU COUNTY.

A Yreka telegram of 12th says: Keating Leonard & Dean, on the Klamath, below the mouth of Scott River, on Saturday before last, took out one hundred ounces of gold, and have been taking out large quantities ever since. Mining on the river bed of Klamath heretofore has not paid very well. Near the mouth of Humburg some claims are paying well. The company at Virginia Bar took out seventeen ounces last week.

Nevada.

COPE DISTRICT.

BALD MOUNTAIN.—*Elko Chronicle*, Oct. 2d: The Blue Bell has only been prospected to a depth of four feet, where the ledge is three feet wide and carries a vein rich in silver and copper. The Bailey shows similar ore with less copper. This mine is only eighteen inches wide, but rich. The Winona is eight feet wide; is down between twenty and thirty feet, and assays \$44 in silver and 46 per cent. copper. The Bismark has been explored only ten feet; the shaft is altogether in metal, no walls yet found.

COPE.—*Elko Independent*, 8th: We learn that the two new mills are about ready to start, and the prospects for an inexhaustible supply of ore certain.

BULL RUN.—*Cor. of same*: The Blue Jacket promises to be the Comstock of Northern Nevada. The ledge has been developed by shaft 45 feet and by drift 75 feet. The vein is from 12 to 20 feet wide, and contains a large percentage of free milling ore, besides quantities more or less base. An offer for it of \$30,000, coin, by Colonel Fogus, of Silver City, has been refused.

ESMERALDA.

AURORA.—*Cor. Inyo Independent*: The Wide West mill has been running for some time, and worked small lots of ore from the principal ledges, with results, none of which seem to have come up to expectations. The mill will continue running, provided sufficient ore can be obtained.

CASTLE PEAK.—Parties report that the mill in course of erection by Mr. Dagne will be running by the 15th of next month. A large quantity of ore is already on the dump, and the work in the tunnel running into the Dunderberg mine, near the mill, is still going on. In the south drift they have struck a large body of ore, richer than any yet discovered, and almost free from sulphurets.

REESE RIVER.

MAMMOTH DISTRICT.—*Reveille*, Oct. 6th: We learn that the Mammoth are erecting a Stetefeldt furnace, to be in operation before the end of fall. The mill has ten stamps.

MOREY.—Same of 8th: On Thursday twenty-six tons of ore were brought to this city from Morey district, for reduction at the Manhattan mill. The lot is estimated to yield largely of silver. A previous shipment yielded \$500 per ton.

HOT CREEK.—Last evening Wells, Fargo & Co. shipped seven bars of bullion valued at \$5,900, produced at Hot Creek district, Nye county.

The *White Pine News* learns that there is an excitement at Hot Creek about a new discovery called the 'Two G's.' It is 12

miles south of Hot Creek, and appears to be a ledge 4 to 8 feet wide; has been stripped for 900 feet, and an incline sunk 20 feet. The ledge contains good smelting ore and chlorides, averaging \$100 per ton. At Belmont the El Dorado South is looking better than ever. At a depth of 200 feet, a new level has been started. The ledge is 9 to 11 feet wide. Ore from this level, sent to the Manhattan mill, yielded \$800 per ton. The R. B. Canfield mine is being opened out in good shape.

MINERAL HILL.—*Cor. of Eureka Sentinel*, 6th: The new ten stamp mill is in successful operation, and all round may be seen numbers of chlorides, with their piles of ore in sacks, averaging three tons to the pile. A few of the old miners have at the mill quantities of ore that will work from \$150 to \$300 per ton. There have been of late a number of rich strikes. The best is the Big Sandy, now producing the richest ore on the Hill. The owners are Robinson, May & Co.

The *Reveille* of 3d learns from E. N. Riotte, who returned from Mineral Hill yesterday that there was upwards of a thousand tons of ore on hand that would average \$300 per ton.

WASHOE.

YELLOW JACKET.—*Enterprise*, Oct. 9th: Daily yield, 170 tons tons, from the 800, 900 and 1,000-foot levels. The drift north at the last is within 20 feet of the winze from above. On last month's work the mine is \$50,000 to \$60,000 ahead.

HALE AND NORCROSS.—On the seventh level the ore in the breasts is of very superior quality, and the quantity is sufficient to insure the payment of dividends for months. The daily yield from this level is 170 tons.

OPHIR.—It is expected that the main south-west drift will reach the point where the deposit of gray ore was found on the old 900-foot level, in 75 or 100 feet.

GOULD AND CURRY.—The mine is yielding 70 to 80 tons per day of good milling ore, and there will be no more 'Irish dividends' for some time.

CHOLLAR-POTOSI.—*Gold Hill News*, 8th: Daily yield 260 tons. The ore breast south at the Potosi tunnel level has given out.

CROWN POINT.—Daily yield between 45 and 50 tons, from the upper levels. The ore shows considerable improvement. The incline is down 70 feet below the 1,100-foot level, the bottom showing hard, lively white quartz.

OVERMAN.—Daily yield 70 tons, principally from the Lambert tunnel and the lower tunnel, car samples showing an average assay of \$40 per ton.

GOULD AND CURRY.—Daily yield seventy tons, all second class ore, yielding an average assay of \$58, with the exception of one ton per day of first class, from the Potosi section.

SACRAMENTO AND MEREDITH.—The new mill has been running at an extra lively rate this week on ore from the upper part. Considerable free gold specimen ore is met with.

VIRGINIA CONSOLIDATED.—Ross & Co. are pushing the 500-foot level drift further west under a new contract. They are in 645 feet from the shaft.

BULLION.—The drift at the 130-foot foot level is continued to the north line, and promising quartz encountered.

BELCHER.—The pay streak at the north end of the 200-foot level continues looking well. It is four feet wide, and car samples show \$60 per ton.

CALEDONIA.—This mine looks promising and is yielding excellently. About 50 tons of ore per day worked at the Piute mill.

OCCIDENTAL.—Mill running steadily, on ore from the lower tunnel, which is being continued north.

SIERRA NEVADA.—Nothing new except the resumption of dividends. Both mine and mill running.

SAVAGE.—Daily yield, 90 tons, mostly from the 8th level.

HOPE.—Both mills running; yield, 46 tons per day of \$25 ore.

IMPERIAL MINE.—The 1,300-foot station being opened.

WHITE PINE.

MATTESON.—*News*, Oct. 4th: Yesterday we paid a visit to these works and found everything running like clock-work. During September, the works shipped 80 tons of base bullion valued at \$25,600. By the end of this week furnace No. 3 will be in blast, and work on the separating and refining works will be pushed with despatch.

ORIGINAL HIDDEN TREASURE.—Same of 5th:—Joshua E. Clayton supersedes W. P. Holmes as Superintendent.

LEASD.—7th: Chicago Mill and Mining Co., has leased the Consolidated Combination and Wilson mines, on Chloride Flat, and is taking out good ore. The mill will start up next week.

EBERHARDT.—Same of 8th: There are 15 men employed. A part of the force is at work 50 feet west of the Keystone shaft, where a vein of exceedingly rich ore has been struck. We saw there some of the old original genuine chlorides. We next came to the large chamber. Horn silver, chlorides, etc., are still there, and are being taken out as of yore. All the ore which is being taken out now will average \$100 per ton, and is being worked at the Oasis mill, Shermantown, also owned by this company.

The *Elko Chronicle* of 6th says H. M. Bordwell, Superintendent of Construction for the Eberhardt's new mill, is in town attending to

the shipment of the machinery. It adds that this is to be the most complete mill in the United States. "Every improvement known to mill men will be made use of regardless of expense, in order to make it the best quartz mill in the world."

ITEMS.—*Inland Empire.* Rich and extensive body of ore struck in the Maryland mine, Pinto District, on the 2d. inst. . . . Ruthburn furnace turns out 95 bars daily from Jenny A. ore. . . . Earl mine started up on the 2d. Wm. Roberts, Supt., says the ore will mill on an average \$100 per ton. . . . Seven bars bullion from Meadow Valley Co., Pioche, received on the 5th by stage. Weight, 553 lbs.; value \$9,203. . . . The Stanford mill is again running.

REVELLE DISTRICT.—*News.* 6th: The mill started up on the 21st ult., with 400 tons first class ore on the dumps, and 20 tons coming in daily. The Co. have 75 men at work. The Mediterranean and Atlantic mines, belonging to the Co., are capable of producing ore enough to furnish the mill.

The assaying department is conducted by R. R. Hawkins, graduate of Freiberg.

FREIDEN DISTRICT.—On the Shonte claim, an incline has been sunk 40 feet, on a ledge six feet wide, assaying from \$100 to \$500 in silver and 50 per cent in lead. They are shipping to San Francisco 30 tons per month. The Trident shows a ledge eight feet wide—bearing the same character of ore as the Shonte.

EUREKA.—*Sentinel.* 9th: The Liebenau furnace, at the Eureka Consolidated, works to perfection. The ore, flux, and coal, are all so placed that by simply pulling a rope, they fall into the furnace, and become so thoroughly mixed, that already a saving of 30 per cent. has been effected over the two old furnaces, and no noxious vapors annoy the feeder. From four to five tons of bullion are turned out daily. The McCoy furnace, is working well. The ores smelted this week have been from the Goben and Simot mines, and assay \$300 to the ton. The Jackson works started up this time with two furnaces and new 30 horse power engine. Everything runs smoothly. The Buttercup under Colonel Robbins, is to start up to-morrow with all supplies sufficient to run during the winter.

Eureka wants a mill. A man with capital could make the property clear in six months. The *Sentinel* is authorized to say that a site and water would be donated to a man who means business.

Arizona.

BRADSHAW.—*Prescott Miner.* Oct. 1st: The Del Pasco are getting out and crushing ore in arastras, which they estimate will pay from \$250 to \$300 per ton. The Co. propose to grind twenty-five tons before cleaning up. A large number of locations have been made on veins discovered since the rich strike on the Del Pasco. New Era sunk a shaft sixteen feet deep and found eight feet in width of ore that will pay \$40 per ton.

ITEMS.—Water in Big Bug and Lynx creeks has given out. At the Big Bug mill repairs are being made. At the Eureka mill all hands have been discharged. M. Ravena, the owner of the Conquistador mine, near La Paz, lately sent some specimens of the ore from the mine, to Prescott. It is much decomposed and very rich. No placer miners are working in this vicinity except a few on Lynx creek and the Hassayampa. Alters, May and others, have contracted with Geo. Lomnt to construct a ditch a mile and a half in length to carry water from the Hassayampa to their claims. Levi Rashford, has had some work done on his location on the Vernon lode. Below Rashford's claim, towards the creek, Mitchell has found the vein and sunk on it eight or ten feet, finding the lode three feet wide with a streak of pay ore eighteen inches thick, very rich. Brooks and Mitchell are types.

Colorado.

ITEMS.—*Central City Herald.* Oct. 5th: On the Kansas lode, B. C. Waterman is running 52 stamps, 32 in the Kansas-Colorado mill, and 20 in that of Eureka gulch. They are supplied with ore from his claims on the Kansas, Camp Grove and Flack leads, Waterman's claims on the Gardiner supply ore for the Philadelphia twenty-five stamp mill. Potter & Holley run their own and the "New Bedford" on custom ore. Clayton and Hardisty are each running without cessation, the latter on "Barroughs." Lewis at the Gilpin County mill is supplied with ore from the same lode. The Whitcomb mill is also running day and night. Mr. Beach is working the Illinois mill and is getting out considerable ore. Altogether there are more stamps in motion in Nevada than at any time in our recollection—twelve mills with 208 stamps (including the Eureka and Lexington.) The Prize lode continues to yield a large quantity of very rich quartz.

SUMMIT COUNTY.—We learn that preparations are being made for more extensive work in placer mining in Summit county next year than ever before. An immense number of claims are being taken up. Ira Clark & Co. have sold their claim on the Blue to Greenleaf for \$2,000. John Sanderson, who owns one-half the claim of the Boston Co. is making a handsome revenue. Week before last their claim yielded 37 ounces (with six men employed.) Last week they took out 11 pounds of amalgam, containing probably 68 ounces of gold. John Sanderson is getting out a dollar to the pan from ground sluiced down from the bank, which did not wash into the flume.

GRAND ISLAND.—This district is largely increasing its product and the shipments of ore are daily more extensive. The Cariboo the richest in Colorado, employs 60 men. An im-

mense quantity of rich ore is sent to Hill's. The Ohio mine, of which John Baker owns one-half, is being energetically worked. He will put up a mill next spring. It has every indication of being extremely rich. He is taking out some ore for shipment to Hill, which runs \$500 to the ton. The crevice is about three feet in width.

NEVADA DISTRICT.—Hingle & Co's claim on the Flack lode is leased by several Cornishmen. O'Donnell, Mackey and Collins on the Keystone lode have struck very rich pay. The crevice is nearly six feet in width, three feet of which yields ore so rich that it is sold to Hill without sorting. They are 320 feet down, and have 80 feet of quartz in sight.

The *Register* has a "special" from Denver, dated Sept. 28th, as follows: The First National Bank of Denver, has to-day on exhibition, the largest bar of gold ever run at one time, in the world. It measures 12½ inches in length, 6½ in width, and 4½ in height. It weighs 2,348½ ounces. Finesness of gold, 792; of silver 193. Value, \$50,000.

GEORGETOWN.—*Miner.* Sept. 29th: The Brown Co. ship two masses of silver this week, one weighing 400 and the other 1,141 pounds, making a total of 1,541 pounds, Troy. The total product of the Brown mine to date is \$166,554.55, coin value. Greatest depth from the surface obtained is two hundred feet. The total product of the Terrible mine to date is \$270,000 coin value.

MARSHALL TUNNEL.—The tunnel has been driven into Leavenworth Mountain eight hundred and fifty feet, and cut six well defined true fissure silver veins. The last vein cut shows a large body of good looking ore.

Idaho.

THE NEW ARASTRA.—*Avananche.* Oct. 8th: Last Wednesday we paid a visit to Martin, Hay & Co's new arastra, in Sinker gulch, one of the most complete ever constructed. The main building is 28x40 feet, besides the wheel house, etc. There are pans, vats and settlers. The propelling power is an overshot wheel 35 feet in diameter. Steam for heating the pans, is generated in a furnace, the smoke of which will circulate in the wheel house during the winter. The arastra is 8½ feet in diameter. Two more will be added soon.

OWYHEE BULLION.—Wells, Fargo & Co. shipped this week 14 bars of bullion, valued at \$31,000.

Lower California.

RICH QUARTZ.—*San Diego Union.* Sept 24th: Mr. I. K. Fisher, just returned from San Rafael Valley, says that the first ledge was struck by a Mexican company. Another ledge subsequently discovered south of this, is owned by Wm. Off-hand and others of this place, and Governor Rojo, of Lower California. The first is very rich. Mr. Fisher says that one of the owners has pounded out with a hammer on a flat rock from one to three pounds of gold daily. A small piece shown to us was at least half gold. He says this is the richest quartz claim he has seen during fourteen years' experience in the mines of this coast. The ledge is from 12 to 18 inches in width. As fast as the quartz is taken out it is sacked and divided between the partners, each of whom pounds up his own rock. * * * Mr. Lowinsky, and Mr. Reinhold have also just returned from San Rafael camp and confirm Mr. Fisher's statement. The dirt all pans out well. Pockets of quartz are found which contain as much gold as rock. These gentlemen witnessed the pounding of some rock from which nearly half a pound of gold was obtained. Mr. Lowinsky brought up two nuggets worth about \$50 each.

Montana.

TEN-MILE CREEK.—*Cor.* of Helena *Herald* Oct. 6th: Sairs & Co., have closed for the season and gone to Canyon Creek. Simpson & Hesse will make their last clean-up in ten days, and from the looks it will run up into the thousands. They calculate on drifting night and day, this winter. The Alpha Sluicing Co. are driving ahead, as also the Ophir. Anderson & Co. are still ground-slucing, with good pay. On Monitor gulch everyone is in good spirits, and there will be three more flumes in next Spring. In Try Again, everything is prosperous, with two more companies at work.

WASHINGTON GULCH. *Cor.* of same: Some work is being done on the quartz lodes in and around Sterling. Five or six arastras are on the whirl, and the Hobart mill is running pretty steadily. The placers here are turning out better than ever. Parkinson, James & Co's ground paid last week \$24.60 per day to the hand. S. C. Mining Co.'s yielded an ounce per day to the hand.

THE DITCHES.—*Deer Lodge Independent.* Oct. 1st: The completion of Race Track ditch to Uncle Ben's gulch and Campbell's ditch from Lost Creek to adjacent bars, has enabled a number of companies to open their mines. So far, all have done well.

New Mexico.

MINING PRODUCT FOR THE WEEK.—*Cimarron News.* Oct. 1st: Aztec mines, for eight days, ending Sept. 25, 1870, 29 ounces of gold. Pollock's claim, Grouse Gulch, Moreno mines; seven days, 24 hours per day, eighteen men employed, one hundred inches of water, product, 55 ounces of gold. Result of last run of New Orleans Co., on New Orleans Flat, in the Moreno mines; 7 days, 4 men, gold produced, 25 oz. 6 dwt. Result of last run of Last Chance claim, belonging to the Maxwell Land Grant and Railroad Co. in Moreno mines; 9 days, 2 men, gold produced, 12 ozs. 8 dwt.

The New Patent Act.

AN ACT TO REVISE, CONSOLIDATE AND AMEND THE STATUTES RELATING TO PATENTS AND COPYRIGHTS.

APPROVED, JULY 8, 1870.

[CONCLUDED FROM PAGE 263.]

Sec. 67. And be it further enacted, That the benefit of the extension of a patent shall extend to the assignees and grantees of the right to use the thing patented to the extent of their interest therein.

Sec. 68. And be it further enacted, That the following shall be the rates for patent fees:

On filing each original application for a patent, fifteen dollars.

On filing each original patent, twenty dollars.

On filing each caveat, ten dollars.

On every application for the release of a patent, thirty dollars.

On filing each disclaimer, ten dollars.

On every application for the extension of a patent, fifty dollars.

On the granting of every extension of a patent, fifty dollars.

On an appeal for the first time from the primary examiners to the examiners in-chief, ten dollars.

On every appeal from the examiners in-chief to the Commissioner, twenty dollars.

For certified copies of patents and other papers, ten cents per hundred words.

For recording every assignment, agreement, power of attorney, or other paper, of three hundred words or under, one dollar; of over three hundred and under one thousand words, two dollars; of over one thousand words, three dollars.

For copies of drawings, the reasonable cost of making them.

Sec. 69. And be it further enacted, That patent fees may be paid to the Commissioner, or to the Treasurer or any of the assistant treasurers of the United States, or to any of the designated depositaries, national banks, or receivers of public money, designated by the Secretary of the Treasury for that purpose who shall give the depositor a receipt or certificate of deposit therefor. And all money received at the Patent office, for any purpose, or, from any source whatever, shall be paid into the treasury as received, without any deduction whatever; and all disbursements for said office shall be made by the disbursing clerk of the Interior Department.

Sec. 70. And be it further enacted, That the Treasurer of the United States is authorized to pay back any sum of money to any person who shall have paid the same into the treasury or to any receiver or depositary, to the credit of the Treasurer, as for fees accruing at the Patent Office through mistake, certificate thereof being made to said Treasurer by the Commissioner of Patents.

DESIGNS.

Sec. 71. And be it further enacted, That any person who by his own industry, genius, efforts and expense, has invented or produced any new and original design for a manufacture, build, statue, alto-relievo, or bas-relief; or any new and original design for the printing of wools, silk, cotton, or other fabrics; any new and original impression, ornament, pattern, print, or picture, to be printed, painted, cast, or otherwise placed on or worked into any article of manufacture; or any new, useful, and original shape or configuration of any article of manufacture, the same not having been known or used by others before his invention or production thereof, or patented or described in any publication, may, upon payment of the duty required by law, and other due proceedings, obtain a patent therefor.

Sec. 72. And be it further enacted, That the Commissioner may dispense with models of designs when the design can be sufficiently represented by drawings or photographs.

Sec. 73. And be it further enacted, That patents for designs may be granted for the term of three years and six months, or for seven years, or for fourteen years, as the applicant may in his application elect.

Sec. 74. And be it further enacted, That patentees of designs issued prior to March two, eighteen hundred and sixty-one, shall be entitled to the extension of their respective patents for the term of seven years, in the same manner and under the same restrictions as are provided for the extension of patents for inventions or discoveries, issued prior to the second day of March, eighteen hundred and sixty-one.

Sec. 75. And be it further enacted, That the following shall be the rates of fees in design cases:

For three years and six months, ten dollars.

For seven years, fifteen dollars.

For fourteen years, thirty dollars.

For all other cases in which fees are required, the same rates as in cases of inventions or discoveries.

Sec. 76. And be it further enacted, That all the regulations and provisions which apply to the obtaining or protection of patents for inventions or discoveries, not inconsistent with the provisions of this act, shall apply to patents for designs.

KUSTEL'S NEW BOOK, on the Roasting of Ore and their Treatment without Quicksilver, is favorably noticed at great length by the London Mining Journal, of Sept. 10, 1870. No better authority can be quoted. Its able review of the work closes with following paragraph:

Although the book contains less than 150 pages, it will afford all the information likely to be required upon the subject, and the illustrations of furnaces, implements, and working apparatus are excellent. It gives a condensation of most that has already been published either in German or English with reference to the extraction of the precious metals, and contains much that is new in the way of descriptions of inventions to which the experience gained in the extensive mining operations carried on in the Pacific States have given rise. The merit of the work is beyond question, and as it is certainly as cheap a half guinea's worth as could be purchased by those for whom it was intended, the prediction of the author—that its chances of doing much good are far better than the probabilities of its repaying its author and publishers—is one which happily is not likely to prove true; it will doubtless find an ample number of patrons, both in the Old World and in the New.

Printed and sold by Dewey & Co., Scientific Press Office. Price, \$2.50 gold, or \$3.00 currency—post paid.

New Incorporations.

The following have filed certificates with the County Clerk, San Francisco:

S. F. STARCH WORKS.—Sept. 24. Capital stock, \$50,000 in 500 shares. Trustees: E. S. Clark, A. J. Gove, Wm. Gray, J. Q. Baker, and James B. Lavery.

HIDDEN GRAVEL CO., Alta Hill, Grass Valley.—Sept. 24. Capital stock, \$300,000 in 3,000 shares.

BRADSHAW S. M. CO., Nye County, Nevada.—Sept. 26. Capital stock, \$1,630,000. Trustees: Wm. H. Sharp, Wm. Steubart, and W. Solberg.

LANE AND KUTZ CARANO M. CO., William's Creek Meadows, British Columbia.—Sept. 26. Capital stock, \$500,000 in 5,000 shares. Trustees: A. H. Rose, J. Kutz, I. P. Rankin, I. T. Milliken, and T. W. Moore.

GERMAN SAVING AND BUILDING ASSOCIATION.—Sept. 28. Trustees: L. Goetz (President), J. Taupphauser (Vice President), L. Simons, F. Wickenhauser, C. Schaffer, A. Hafstrom, J. Shober, J. W. Hahn, W. Kappman, H. Habermehl, J. F. Law, and H. Pfersdorf, Secretary.

AUSTRIAN BENEVOLENT SOCIETY.—Trustees: Vandro, Leeds, Drohag, Galavina, Voght, Micollich, Zamlich, N. Viaretti, and Cosmo.

EAOLE REAL ESTATE CO.—Capital stock, \$50,000 in 50 shares. Trustees: Schmidt, Snider, W. A. Janko, Vm. Ross, Schuler, Cantos, and Thiesch.

MINERVA HILL M. CO., Elko county, Nevada.—Capital stock, \$50,000 in 500 shares. Trustees: M. Lent, G. D. Roberts, G. Hearst, McDonald, and Currier.

PACIFIC COAST WHECKING CO.—Oct. 5. Capital stock, \$15,000 in 150 shares. Trustees: H. B. Platt, D. Beaudland, S. P. Taylor.

The following have been recorded in the Secretary of State's office, Sacramento:

BURNIAN HILL R. R. CO. S. F.—Sept. 24. Capital stock \$250,000 in 2,500 shares. Directors: A. Bonheday, B. S. Brooks, P. Kimball, A. Parker and K. Porter.

BANK OF MENDOCINO.—Sept. 26. Directors: W. Heeser, Augustus Heeser, S. B. Ford, C. W. Denlow, J. E. Chalant, T. Reeves, J. Townsend and J. P. Carrell.

D. SPATCH PUBLISHING ASSOCIATION, Mendocino.—Sept. 26. Capital stock, \$1,500 in 30 shares. Trustees: J. E. Carlson, J. D. Murray, Mat. Lynch, D. W. Callum, J. B. Ford, J. E. Chalant, R. Reeves and W. Heeser.

NEW YORK G. AND S. M. CO., Sacramento County.—Sept. 28. Capital stock, \$30,000. Trustees: J. B. Stone, L. Brooke and H. McCullen.

REDWOOD CITY WATER CO.—Oct. 1. Capital stock \$50,000 in 50 shares. Trustees: J. V. Diller, H. Kincaid and T. W. Lathrop.

BIO BASIN CANAL CO., San Mateo.—Oct. 7. Capital stock, \$15,000. Trustees: H. Templeton, J. Bowley and A. Teague.

PERCADERO CANAL CO.—Oct. 7. Capital stock, \$50,000. Trustees: H. Templeton, J. Bowley, and A. Teague.

SAN JOAQUIN GAS CO.—Oct. 10. Capital stock \$75,000. Trustees: J. H. Kelsey, E. Moore, J. Jackson, G. B. Claborn, and L. C. Ellis.

SAN DIEGO GAS CO.—Oct. 10. Capital stock, \$72,000. Trustees: W. H. Perry, C. P. Taggart, W. Woodworth, J. Gallon, and J. B. Boyd.

ALTA G. AND M. CO. No. 3, Grass Valley.—Oct. 10. Capital stock, \$600,000 in 6,000 shares. Trustees: Silverton, Locke, E. R. West, R. Clarke, and Burnett.

Meetings, Elections, Etc.

LAND RECLAMATION CO.—Sept. 27. Trustees: J. B. Haggin (President), G. D. Roberts (Treasurer), W. Doan (Secretary), J. J. Hagar (Vice President), S. Heydenfeldt, F. Zelle and C. H. Burton.

OSCEOLA G. AND S. M. CO.—Sept. 30. Trustees: J. F. Smith, G. McLane and L. Reynolds.

MEADOW VALLEY EXTENSION M. CO.—Trustees: Trustees: H. Jenin, L. Mayna and A. J. Bowie, Jr.

NORTH STAR G. AND S. M. CO.—A. K. E. Harmon (President), W. C. Harmon (Treasurer), D. Jennings (Secretary), and D. Hoyt, Superintendent.

SEGREGATED BELCHER.—Oct. 4. Trustees: A. K. Harmon (President), J. A. Pritchard, J. Marks, J. Gillig and J. P. Jones.

BANK OF CALIFORNIA.—Oct. 4. Trustees: D. O. Mills (President), W. C. Ralston (Cashier), D. J. Hall, John G. Earl, Louis Sachs, A. Haywa, W. E. Barron, Thomas Bell, Louis McLane, Nicholas Lanning and William Norris.

OCCIDENTAL M. CO. Virginia City.—Oct. 10. Trustees: J. P. Smith (President), M. Strouse (Vice President), J. Kapp, L. W. Newell and R. T. Smith C. M. Mayer, Secretary.

QUARTZ MILL FOR SALE.—Messrs. Prescott & Schiedel, proprietors of the Marysville Foundry, offer a quartz mill for sale on favorable terms, some particulars of which can be had by referring to our advertising columns. During the past season an unusual number of idle mills have been purchased and put in operation in this State and Nevada, showing a disposition to economize on the part of mining managers.

CONTINENTAL Life Insurance Co., 302 Montgomery street, corner of Pine.

Household Reading.

How to Make Cuttings Grow.

Alluding to the manner of propagating cuttings, the *New England Farmer* says that it has been ascertained that a cutting will develop roots much sooner in moist sand than in rich soil. But the sand cannot maintain its growth for any length of time. To prepare pots for raising cuttings they should be filled nearly to the brim with rich garden loam, dark and porous, not clayey and soggy; then pour in one inch in depth of scouring sand; sea sand will do as well as the yellow sand. Wet this thoroughly, and place the cuttings, from which all but three or four upper leaves have been removed, close to the side of the pot; the contact of the ware against the stem of the cutting promotes its growth. Press the wet sand firmly around the tiny stem. A great deal of your chance for success in raising slips or cuttings depends upon this.

Plant as many cuttings as the pot will hold, from six to a dozen, according to the size of your pot; when they are firmly set in the sand, two or three can be inserted in the middle of the pot. Set them away in a dark, warm place for twenty-four or thirty-six hours. Thns. cuttings will grow quickly in a hot bed, because the temperature is not dry. Their growth depends a great deal upon light, heat and moisture.

If a bud is close at the base of a cutting it will strike root more easily—is not so apt to decay. The roots shoot from a bud, and the lower down it is the surer your success. When the leaves drop, the plant is commencing to grow; if they wither on the stem, it has begun to decay. By following these directions no one can fail to grow all kinds of house plants. Roses and all the rarest flowers of the green houses are propagated in this manner.

How to Judge Building Lime.

As it is often of considerable importance to those who may wish to use lime for any of the purposes for which it is available, that they should be able to distinguish a good article from that which is of inferior quality, we shall describe briefly a few of the common tests by which good lime may be distinguished from that of poor.—Of two pieces of lime about the same size, the heavier will usually be the best. There are a few marked exceptions to this rule, but in general it will afford trust worthy indications.

Good lime is greasy and unctuous to the touch; poor lime is dry and gritty; when good lime slacks in water it falls quickly, causes the water to boil up furiously, and gives out a great quantity of heat. The slaking of poor lime is attended with but a slight boiling of the water, and a small increase of the heat; moreover, the quantity of water required to slack good lime will be nearly one-half its bulk. Good lime, when slacked will swell to twice its original bulk, and it exposed to water continually changed, the lime will all be taken up without leaving any residue. Poor lime when slacked, will swell to two and a half times its original bulk, and there will always remain a gritty residue, no matter how much water may be run over it.—*Am. Engineer.*

A Lean Horse Made Fat.

Many good horses devour large quantities of grain and hay, and still continue thin and poor. The food eaten is not properly assimilated. If the usual food has been unground grain and hay, nothing but a change will effect any desirable alterations in the appearance of the animal. In case oil meal cannot be obtained readily, mingle a bushel of flaxseed with a bushel of barley, one of oats, and another husbol of Tadian corn, and let it be ground into fine meal. This will be a fair proportion for all his feed. Or, the meal of barley, oats and corn, in equal quantities, may be first procured, and one-fourth part of the oil cake mingled with it, when the meal is sprinkled on cut food. Feed two or three quarts of the mixture three times daily, mingled with a peck of cut bay or straw. If the horse will eat that amount greedily let the amount be gradually increased until he will eat four or six quarts at every feeding three times a day. So long as the animal will eat this allowance, the quantity may be increased a little every day. But avoid the practice of allowing a horse to stand at a rack well filled with hay. In order to fatten a horse that has run down in flesh, the groom should be very particular to feed the animal no more than he will eat clean and lick the manger for more.—*Mass. Ploughman.*

Utilizing the Water-Melon.

Our readers will recollect the brief mention made in our issue of the 17th ult. with regard the exhibition at the State Fair, of samples of sugar grown from melons. Both sugar and syrup, each of an excellent quality, can be made from the water-melon, which grows in great abundance and profusion on California soil. In fact, there is perhaps no other product, except grapes, in which California so much excels as melons; and we incline to the opinion that even a larger amount of saccharine matter may be obtained from an acre in melon pulp than in the pulp from beets—while the refuse if somewhat less valuable for stock, would be increased by utilizing the seed as a source for table oil, for which purpose they are very superior.

Water-melons may be more easily utilized than most people imagine, as may be seen from the following process, which has been communicated by a correspondent of the *Prairie Farmer*:

"I endeavor every year to raise a water-melon patch. They are a healthy and delightful fruit, I think. I cultivate the icing variety. When the weather becomes cool in September, we haul a quantity of them to the house, split them open, with a spoon scrape out the pulp in a colander, and strain the water into vessels. We boil it in an iron vessel, then put in apples or peaches, like making apple butter, and boil slowly until the fruit is well cooked, then spice to taste and you have something that most people prefer to apple butter, or any kind of preserves. Or the syrup may be boiled without fruit, down to molasses, which will be found to be as fine as any sugar-house molasses. We have made in a fall as much as ten gallons of the apple-butter, if I may so call it; and molasses which kept in fine condition till May."

DECOMPOSING STRAW.—A correspondent asks about "decomposing straw." We have already, suggested interlaying it with a small quantity of loam. The addition of a small quantity of lime will greatly hasten the process. Gypsum should be added, when readily obtainable as an absorbent for the discharged gasses. Muck or loam answers that purpose, but not so well.

PREPARATION OF GLYCERINE.—Glycerine of itself is usually considered one of the best healing applications known; but the following special preparation which can easily be made by any one, is especially useful in many cases:—Four parts, by weight, yolk of egg, to be rubbed in a mortar with five parts of glycerine. This compound has the consistency of honey, is unctuous, like fatty substances, but is easily removed by water. Applied to the skin, it forms a varnish, which effectually prevents the action of air. It allays the itching in cutaneous affections. It is unalterable, and can be exposed to the air for an indefinite period.

THE SUEZ CANAL.—Late accounts from China say that there are 15 steamers loading at the various ports for Europe via the Suez Canal, at an average of about \$20 per ton freight; while the best iron sailing ships via the cape, are seeking freight almost in vain at rates from \$7.50 to \$10. The canal is causing a commercial revolution in China, and threatens to substitute steam entirely, for sailing vessels for the carrying trade of that part of the world. These are straws which point most unmistakably to the direction in which the wind will soon be sure to blow in this vicinity.

TO MAKE NEW ROPES PLIABLE.—Considerable difficulty is sometimes experienced in handling new rope on account of its stiffness. This is especially the case when it is wanted for halter and cattle ties. Every farmer is aware how inconvenient a new, stiff rope halter is to put on and tie up a horse with. And new ropes for tying cattle are frequently unsafe, for the reason that they are not pliable enough to knot securely. All this can be remedied, and new rope made as limber and soft at once as after a year's constant use, by simply boiling it for two hours in water. Then hang it up in a warm room, and let it dry out thoroughly. It retains its stiffness until dry, when it becomes perfectly pliable.

Life Thoughts.

THE STREAM OF LIFE.—We all sail down the stream of life, and there is no lingering or turning back. If we come to a bank of flowers, or drift beneath soft, rosy skies, we cannot remain to inhale the perfume of one, or enjoy the golden splendor of others. Our course is still onward, and the scenery we must pass by will be varied; now smiling in joyous sunlight, now slumbering in dim and obscure shadow. An occasional ray of sunlight will dart across the scene, and, for the moment we are happy. But we should never despond, even when the clouds lower and appear the most threatening; for Hope ever stands beside us, and points to a better country, where sadness cannot fade away and sorrow comes no more.

DANIEL WEBSTER penned the following beautiful sentiment: "If we work upon marble, it will perish; if we work upon brass, time affects it; if we rear temples, they will crumble into dust; if we work upon our immortal minds—if we imhne them with principles, with the just fear of God and love of our fellow men—we engrave on those tables something which will brighten for all eternity."

Our lives should be like the day, more beautiful in the evening; or, like the summer, aglow with promise; and like the autumn, rich with golden sheaves where good works and deeds have ripened on the field.

WRITE your name by kindness, love and mercy on the hearts of the people you come in contact with, and you will never be forgotten.

LIFE is a book of which we can have but one edition. Let each day's actions, as they add their pages to the indestructible volume, be such as we shall be willing to have an assembled world read.

THE shadows of the mind are like those of the body. In the morning of life, they lie behind us; at noon, we trample them under foot; and in the evening they stretch long and deepening before us.

It is only by labor that thought can be made healthy, and only by thought that labor can be made happy.

HAVE you learned to know you are ignorant? This is God's way of making wise; he bids you ask wisdom, and promises to give.

A FAST AGE.—The present is eminently a fast age. It eats fast, digests fast, assimilates fast, thinks fast, acts fast, lives fast and sleeps fast. The gradual progress of civilization and industrial and mental activity is imperceptibly abridging the period of slumber. Time was when the wants of man were pure and simple; when his activity was measured only by the needs of healthy exercise. Now a poor man must abridge the hours of sleep to provide food for himself and family; while the increased range of thought forced upon the student renders the consumption of the "mid-night oil," essential to eminence in any special department of learning. Thus the coming man will have to abridge his period of slumber to the utmost brevity of duration. The disparity between now and then is growing rapidly more and more marked, and as the world grows older, man will have to live faster and faster until his life dwindles away to a span. Perhaps it may be that the creator thus designs to check the rapid increase of the race, when the world shall have become full, and emigration cease for the want of where to go.

THOUGHT AND BRAIN GROWTH.—Every new idea planted in the thinking mind, is said to grow. It increases in breadth and height and depth, and is constantly taking new forms and new relations as it is variously modified by the ingress of other ideas. It is also claimed by some medical writers that the brain tissue increase in size with brain exercise, especially with deep and earnest thinking. Phenology in fact, is based upon the theory that the various "organs" of the brain increase in a greater or less degree, as the faculties which it is held the several organs represent are brought more or less actively into use. It is stated, on the authority of Dr. O. W. Holmes, that Daniel Webster said he had to change the size of his hat every two years—that his head grew larger as his intellect expanded.

Useful Receipts.

CURE FOR CORNS.—The *Journal of Applied Chemistry*, good authority, says: "Soak the feet well in warm water, then with a sharp instrument pair off as much of the corn as can be done without pain, and bind up the part affected with a piece of linen or muslin thoroughly saturated with sperm oil, or what is better, the oil which floats upon the surface of the pickle of herring or mackerel. After three or four days the dressing may be removed, and the remaining dead cuticle removed by scraping, when the new skin will be found of a soft and healthy texture and less liable to the formation of a new corn than before. We have this receipt from a source which we cannot well doubt, and publish it for the benefit of many suffering readers."

The pain occasioned by corns may be greatly alleviated by the following preparation:—Into a one ounce phial ask a druggist to put two drachms of muriatic acid, and six drachms of rose water. With this mixture wet the corns night and morning for three days. Soak the feet every evening in warm water without soap. Put one-third of the acid into the water, and, with a little picking, the corn will be dissolved.

DIRECTIONS FOR WASHING TATTING.—Get a common glass hottle, sew a piece of thin flannel evenly all over it; wrap the tatting on, carefully tacking each row as flat as possible to the flannel. Sew a piece of tartan (or very thin muslin) over it, leaving the tartan long enough to tie firmly both at the bottom and top of the hottle. Sink the hottle in a large basin of cold water, and soak it all night. Cut up a piece of white soap, put it in a large stew-pan of water, with the hottle, and stew for six hours; if the tatting does not look quite clean, rub the hottle a little with the hand and more soap, and stew it again; rinse well in clean cold water, and put the hottle in the sun or near the fire to dry, when the tatting can be unloosed and taken off. If it has been put on well, and in its proper form, it will be just like new tatting. This is also an excellent receipt for washing valuable lace. The flannel can be left on for future use.

LAMP WICKS.—Few of our readers know that a lamp wick which is equally good with those we buy, may be made out of Canton flannel. Take a strip three times as wide as you wish the wick to be, and as long as you like. Fold it with the fleecy side in, so that it will have three thicknesses, and baste or overcast it up the sides. Almost every housekeeper has bits of Canton flannel which would be used for nothing else, and it saves quite a little item of expense, to say nothing of the convenience of being able to make a new lamp wick whenever it is needed. I have made all the wicks used in our family for the last six or seven years.

MEAD OR SODA WATER.—Three pounds brown sugar, six gills molasses, three pints water, four ounces tartaric acid. Pour one half pint of the water boiling hot on the acid, and the remainder on the sugar, and heat gently; skim when cool, add the acid. Flavor with lemon, wintergreen or whatever you please, and hottle. Pour two tablespoonfuls in a tumbler half full of water; then add one-third teaspoonful soda; stir till it foams. This is a nice cooling drink, and can be prepared by any family and kept ready for use.

WINE JELLY.—One package Cor's Gelatine; one pint of cold water, the juice of two lemons and rind of one. Let the above stand one hour; then add three pints boiling water, one and a half pounds of crushed sugar, one pint wine, and one wine glass brandy; cool in a mould.

HOW TO MAKE TOMATO FIGS.—Pour boiling water over the tomatoes, in order to remove the skins; then weigh them and place them in a stone jar, with as much sugar as you have tomatoes, and then let them stand two days; then pour off the syrup and boil and skim it until no skum rises; then pour it over the tomatoes and let them stand two days, as before, then boil and skim again. After the third time they are fit to dry, if the weather is good; if not, let them stand in the syrup until drying weather. Then place on large plates or dishes and put them in the sun to dry, which will take about a week, after which pack them down in small wooden boxes, with fine sugar between each layer. Tomatoes prepared in this manner will keep for many years.

FARMERS should be, as they are, or if not, may be, the happiest of men and families—surrounded as they are by Nature's purest, most elevating, and ennobling influences.

Cotton in California.

An interesting and important letter on the subject of cotton culture will be found in to-day's agricultural edition, written by a gentleman who has had large experience in that culture at the South, and who has closely studied the adaptability of the soil and climate of California for such culture here. The statements and figures made by this writer are well worth the serious attention of California capitalists, and of all others conversant with that special branch of agriculture. The subject is one well worthy of careful and serious consideration.

In connection with this letter, we have received a note from Col. J. M. STRONG, of Snelling, Merced county, who also forwards for inspection a sample of cotton raised upon his ranch, which is pronounced of very superior quality. The Colonel informs us that his present experiment is the third which he has made within the past six years to raise cotton on the banks of the Merced river.

We should be pleased to hear from him more at length of his actual experience in cotton raising in California.

The White Pine News give up San Francisco in despair and falls back on Sacramento. It advises that city to build reduction works and become the metropolis of the Coast. Good advice, no doubt.

Co-operation in Mining.

This part of the history of mining camps is continually repeating itself: In the beginning, ore is found near the surface of the ground, which can be easily extracted, easily treated, and gives speedy returns, so that small claims can be worked successfully without much capital. But with the increase of depth, the difficulties of mining increase and the quality of the ore often changes, so that more extensive or complicated machinery is required and more capital is necessary. Then, if the district is promising, a monied company comes in and erects a large mill or smelting works, and all is rose-colored; but after the excitement about the "development of our resources" has somewhat subsided, the cry is heard that capital is crushing out the poor man, and capitalists are denounced as selfish and extortionate.

Now the poor miner and the rich capitalist both go to any such locality with the same object and the same determination, viz:—to make as much money as possible in as short a time as possible. Neither has any particular reference to the benefit to accrue to the general public from his labors. Selfishness is the main-spring of action here as it is in business transactions everywhere. Selfishness is natural, in-born in man, necessary for self-preservation, and therefore cannot be found fault with, practically, within certain limits; without those limits, it is sure to over-reach itself. A correspondent of the PRESS, a couple of weeks ago, gave an illustration, as he considers it, of "human selfishness," which applies in this case. A certain monied company pays the very lowest prices possible for ore and declares that it will not pay higher until compelled so to do. The action is natural, although the declaration might not be exactly politic. But he says, further on, that the result is that the company has great difficulty in getting ore supplies. How far all the assertions are strictly true, we are unable to say. We only know that our correspondent is generally reliable, and we give this merely as a possible illustration.

We are writing in the interest of, and to the poor man, and propose to look matters squarely in the face. Acknowledging, then, that both poor and rich man are there for selfish purposes, and that, after a time, the superior advantages of the rich man generally enable him to get a better place and press aside the poor man in the race for riches, the question arises,—what is the poor man to do? Uttering reproaches, or calling to outsiders for help, will not avail. He must help himself. He must himself make it for the interest of the rich man to run in his company.

The poor man always has one advantage, which he ought to avail himself of, although he does not do so often enough. He is strong in numbers. We believe that the answer to the question above is, unite in co-operative societies. If a dozen (taking a general number) of men without capital, but owning mines which have any value, would consolidate their interests or would make some agreement by which their interests would be as one with regard to outside parties, they would form a power and do a benefit to themselves and to every body else. Take an instance of custom smelting works. So long as these works receive only small lots of ore at irregular intervals, so long will their expenses be disproportionately large, and so long will they be actually unable to pay good prices for the ore received. But let them be sure of large and regular lots, and they can afford to give higher prices and, to secure these, will pay them to any party holding the lots.

If, then, several miners would co-operate with one another so as to be able to produce constantly a certain amount of ore (and they could do this more cheaply than

by working separately); they could make excellent business bargains and would have but little cause to complain of oppression. If all the miners of a district, say White Pine, would form a number of co-operative mining companies in this way, as outsiders would then be moderately certain of the steady production of large amounts of ore, not only would the Matteson company readily give prices which could not be complained of, but other competitive companies would be attracted to the place, and the district would take on a new and more vigorous life than ever.

We believe that through such co-operative companies wonders could be accomplished on our coast. Capital would be attracted to legitimate enterprises, in which the poor miner could have an interest. The miner could have a share in the ownership and direction of the works which treated his rock. New districts could be developed. Low grade ore could be worked. The prospector, having a steady interest in a fixed locality, would find a rest from his wanderings, leaving his former task to the new comer who would be urged to greater exertions by the example. The mining camps would increase and flourish. The farmer would be led to settle among the mines, where he would find a good market for his produce.

But our plan demands the existence of honesty, intelligence and steadiness among our mining communities. How far these qualities do actually exist, and to what extent our plan can be introduced into practical life, we leave for the consideration of the individual miner. We merely add that co-operation has been found to work successfully in other branches of business. Why can it not be made to succeed in mining?

THE SAN FRANCISCO MUSICAL INSTITUTE is about to afford our city an opportunity to hear really good music, which action cannot be too highly commended and reflects to the credit of the directors. A series of five chamber concerts are to be given in the hall of the Mercantile Library, at which the best talent will be employed, and the programme will, without doubt, be excellent. Boston provides, in the Harvard symphony concerts, the best music in America, and we hope that San Francisco will give our musical talent such a hearty support that we too may be able to justly pride ourselves on our concerts. We have full confidence in the directors of the Institute, and wish them the success which they deserve. The first concert will be given on the 20th. Thanks for the ticket.

ANOTHER GRASS VALLEY MANUFACTORY.—Messrs. Tyrrell & Perry, says the Union, on Anburu street, near the Wolf creek crossing, have established an important factory. The kind of nails called "track nails," or the nails which fasten iron bars in the wood which makes the run way for the miner's cars, is made in Grass Valley. These nails have heretofore been imported from the Eastern States. No factory in California has made the track nail.

CHARGING QUICKSILVER.—In answer to a query from a "Sierra County Millman," we would state that it takes from one to one and one-third ounces of gold to charge 100 pounds of quicksilver for amalgamating purposes. The largest amount we ever obtained, in a mill experience of years, from retorting quicksilver, (which had been in use six months), was 4½ ounces of gold, worth \$16 an ounce, from 300 pounds of silver and at the end of another six months the yield was a fraction less than four ounces; that is, the quicksilver dissolved and held in solution that amount spite of squeezing through cloth or chamois leather.—Nat. Gazette.

MESSRS. DICK AND FITZGERALD, publishers, New York, send us Frost's Humorous Exhibition Dialogues, a selection of sprightly original dialogues for school exhibitions. Price 30 cents.

Patents and Inventions.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s Scientific Press American and Foreign Patent Agency, the following are worthy of mention:

DEVICE FOR OPERATING HEAVY GUNS.—A. F. Potter. Oakland. In these heroic times, when the hearts of mankind are inclined to war-like deeds, and the great topic of the day is the hostile meeting of armies, the production of an instrument of destruction has an unusual attraction for the general public. People have flocked to see the Prussian needle-gun and the French Chassepot, and no less interest was shown in Mr. Potter's breech-loading cannon, lately exhibited. The present invention has for its object the training and operating of heavy guns, and more especially the elevating and depressing of the gun, so that any required range may be obtained and kept, although the gun may be moved from place to place. It has also for its object the application of a graduated scale, so that the gun can be trained instantly on any point, the range of which is known or has been estimated. These objects are effected by means of cams or eccentrics mounted upon a transverse shaft beneath the gun, so that by means of a series of levers operating them, the angle of the gun can be changed. The lever through which the power is applied, moves over a graduated arc which shows the different distances, and it can be held at any point by a set screw. This does away entirely with the trail-screw (which is liable to be damaged by the weight of the gun or to run down), and provides a simple and effective method of obtaining and keeping any given range.

IMPROVED GANO PLOW.—J. H. Andrews, Benicia. While Mr. Potter has been attending to the devices of war, Mr. Andrews has been cultivating the peaceful arts, and looking to the wants of our own homes. He has succeeded in inventing a new construction of the gang-plow, by which the ready elevation or depression of the plows is effected. In his plow one end of the axle is bent down vertically, and in this vertical part slides up and down a block, which can be fastened at any point by a set screw, and which forms an axle for one wheel. The other wheel is attached to the main axle as usual. The plow frame and the rear end of the pole are connected by a bolt. A lever is pivoted on the seat-support and connected with the plow frame. Another (vertical) lever has its fulcrum at or near the level of the main axle and is provided with friction rollers which move over the lever first spoken of, so that when the foot of the driver presses the upper part of the vertical lever forward, it acts through these rollers on the other lever and thus raises the plow frame.

FLETCHER'S STEAM DITCHING MACHINE has been on exhibition the last week at I. H. Smalls, on Beale near Market street, and has attracted considerable attention. On a frame, 41 feet long and 12 feet wide, mounted on four wooden wheels, are placed a 23-horse power steam engine, the cutting apparatus and the belts for raising and discharging the earth. There are four revolving knives, for pulverizing the ground, two feet in width, and baving on each side a blade for turning the sloping edge of the ditch. These can be raised or lowered as desired. The earth is thrown from them upon a gutta percha apron or belt, which elevates it to the rear of the machine, whence it is thrown off to the side of the ditch by a horizontal belt. The machine, we are told, will cut daily from one to two miles of ditch 4½ feet deep, 4 feet wide at the top, and 28 inches wide at the bottom, three workmen and an engineer being required to run it. The entire weight is about 8 tons.

Universal Wood Worker.

A glance at the accompanying engravings will show a most useful labor-saving machine for wood working, which is adapted to almost every variety of work of the kind. The cuts show both sides of the same device,—on that represented in Fig. 1, all kinds of jointing, rabbeting, bevelling,

C, two other adjustable tables (the three being independent of one another) sliding on beds, D, which rest on inclines, E. Those last are bolted on a sliding frame, and by moving them backward and forward by means of the screws, F, the tables are raised and lowered. An iron fence, G, graduated in half and quarter inches, is fastened at right angles to B, being held by

niture of every description, carriages, wagons, railroad cars, distillers' and brewers' tubs; in machine shops, brush factories, etc., etc. It has a capacity for heavy or for light work, is not complicated, is quickly adjusted, requiring only the time necessary for replacing one head by another, can be worked on advantageously by two persons at the same time. We com-

Fig. 1

UNIVERSAL WOOD WORKER.—SIDE FOR JOINTING, RABBETING, ETC.

Fig. 2

UNIVERSAL WOOD WORKER.—SIDE FOR MAKING MOULDINGS, ETC.

panel raising, gaining, planing out of wind, smoothing, plowing, circular moulding, cornering, hand-matching, heading, fluting, sawing, etc., are done; while the other side, Fig. 2, is adapted for thickening, making mouldings, sash, door and blind work, and all the purposes for which a sticker or moulder of this capacity is intended. It will plane eight inches wide, and two sides at once, has a fifteen-inch drop and two feed rollers with a parallel feed. Such is the endless variety of work for which the machine is adapted, and as good authority has pronounced the quality of the work done as "remarkably good," we have spoken in its praise.

We can give but a very brief and partial description of the machine, which is clearly enough shown in the cuts. A is the frame; B, an adjustable table; C

wing-nuts through slots in the arms, and can be moved over the tops of the knives.

Attached to the beds, D and A, and to cross-ties below, is an arrangement, shown in the cut, for moving the tables (in raising and lowering) in an oblique direction, and carrying them towards the bits in raising, and away from them in lowering, so as to prevent their being struck by the bits when adjusted and running. The bevel nut and fence are made in a single piece and can be adjusted at any angle. Three kinds are made, one with boring and routing attachments, one with sticker attachments, for planing one side, and one with sticker attachment for planing two sides.

We are told that the machine is in successful operation in more than six score of the best shops in the country, where it is used for making sashes, doors, blinds, fur-

niture of every description, carriages, wagons, railroad cars, distillers' and brewers' tubs; in machine shops, brush factories, etc., etc. It has a capacity for heavy or for light work, is not complicated, is quickly adjusted, requiring only the time necessary for replacing one head by another, can be worked on advantageously by two persons at the same time. We com-

THE MAXWELL LAND GRANT AND R. R. Co. have served a notice on the Moreno M. and Water Co., forbidding them to divert into their ditch any stream of water on the land claimed to belong to the grant. The *Press and Telegraph* claims that the Moreno Valley is outside of the limits of the grant.

PROSPECTING PARTY.—A company is being formed in Sacramento for the purpose of sending prospectors to Utah. Two men are to start soon, one of whom has resided in the Territory some eighteen months, according to the statement of the *Record*.

Notes on Contributions to Our Cabinet.*

Mr. R. H. Evans has very kindly sent us a number of specimens of ore from the mines around Kernville, Kern county, together with notes thereon. Those numbered 504 to 507 (inclusive) are from mines owned by the Big Blue Lead corporation, which are all worked at the present time.

No. 504.—Under this number are included four samples from the Big Blue, a lode from 60 to 80 feet wide, which has been worked more or less for the last eight years. The ore has paid from \$3 to \$8 per ton in gold, some closely selected lots yielding \$60. The vein has a north and south strike and a dip to the west. The deepest shaft is down 80 feet. Nearly all the ore milled, some 10,000 tons, came from within 30 feet of the surface, the water hindering operations below that depth. The country rock is granite. The gangue is quartz, in some specimens considerably decomposed, holding varying amounts of arsenical pyrites (mispickite).

No. 505.—A sample from the Sherman lode, which is about 3 feet wide, and has been worked to a depth of 260 feet and over a length of about 300 feet. The ore averages about \$30 per ton. The specimen is marked \$23, and apparently came from the walls of the vein.

No. 506.—Two specimens from the Ubana lode, a small vein about 12 inches wide, but rich. The ore mills from \$40 to \$70 per ton. Both specimens are considerably decomposed, and one shows quite a large amount of free gold.

No. 507.—Two specimens from the Jeff Davis lode, the richest, it is said, in the district, the ore milling from \$60 to \$100 per ton. The vein is from 12 to 18 inches wide. Both pieces are considerably decomposed and are marked \$87 per ton.

No. 508. This is a specimen of ore from the Joe Walker mine, Walker Basin. It is not particularly remarkable in appearance, is white quartz containing a little mispickite, etc.

No. 509.—Mr. R. F. Knox, the same who has been running his improved furnace for reducing quicksilver ores, presents us with a handsome specimen of cinnabar from the Manhattan mine—a new working—in Lake county.

*Under this heading we shall continue to mention and describe, according to merit, such specimens of ores, minerals, fossils, curiosities, etc., as may be sent to us by mail or express prepaid. Each article will be numbered, marked with the name of the donor and the locality, and placed in our cabinet. A full account of the place, occurrence, etc., when sent adds much to the value of such specimens.

ORGANIC REMAINS.—A few days ago, says the *Avanuche*, of Silver City, Idaho, H. B. Maize of this place, found imbedded in the soil on Rabbit Creek, about ten miles from Snake River, what seems to have been an elephant's tusk of huge dimensions, it being nine inches in diameter at the base and six feet in length. In the same locality Mr. Maize also noticed fragments of petrified wood in abundance, and a variety of bones of animals whose species probably do not now exist. The entire country between here and Snake river, and extending from Bruneau to Reynolds' creek, is one vast expanse of organic remains, which would furnish an interesting field of scientific research for the geologist as well as the comparative anatomist.

BROMINE.—The Commissioner of the General Land Office is in the receipt of potash salts from Churchill county, Nevada. As these extensive deposits continue to exercise considerable influence upon chemical industry, we call the attention of the public to this important new source of our mineral wealth. Not only do they furnish now the very purest potash, but the lye resulting therefrom has also become available for bromine, the price of which since 1865 has fallen to one-fourth of its former value. The bromine has scarcely been of any use heretofore, but since the discovery of the potash deposits in Safford and in Nevada, it has become of daily growing importance.—*Carson Appeal*.

THE whole mountain range around San Bernardino is reported on fire.

BILLIARDS.

MESSRS. PHELAN & COLLENDER,

The well-known Billiard Table Manufacturers of New York, have established at 541 Market street, this city an extensive branch of their business, where they propose to keep constantly on hand the largest and most complete assortment of Billiard Tables, Cloth, Cues, etc., on this coast. The Tables are of the latest styles and size recently adopted in the Eastern States, are manufactured in the best possible manner, and furnished with Phelan's latest improved Cushions. All goods sold will be of the best quality, and the prices fully as low as any other house in the business. The public are invited to visit our warehouses and inspect our stock.

GEO. E. PHELAN.

DESIGNS AND PLANS

FOR THE

NEW CITY HALL

OF

SAN FRANCISCO.

Office Board of City Hall Commissioners, southeast corner of Sacramento and Montgomery streets, San Francisco, June 22, 1870.

The Board of City Hall Commissioners hereby give notice that they will be prepared to receive at their office, on or before the FIRST DAY OF NOVEMBER NEXT, designs and plans for the new City Hall of San Francisco.

The Commissioners, in order to obtain the very best design and plan, invite the fullest competition among architects, and to this end have resolved to offer the following premiums:

First—For the design and plan selected and adopted \$3,500
Second—For the second best design and plan 2,000
Third—For the third best design and plan 1,500
Fourth—For the fourth best design and plan 1,000
Fifth—For the fifth best design and plan 500

The premiums payable in City Hall warrants.

As a guide to architects in the preparation of the designs and plans, the Commissioners have prepared a pamphlet containing full instructions and suggestions, as well as the terms and conditions upon which the premiums will be awarded.

Pamphlets can be had on application at the office of the Commissioners.

Any design or plan in which the requirements of the Board, as set forth in the printed instructions, have not been reasonably complied with, will be rejected from the competition.

P. H. CANAVAN, Chairman,

JOS. G. EASTLAND,

CHAS. E. McLANE,

City Hall Commissioners.

26v20-4m

A NEW REMEDY.

As this Preparation of these plants, lately made public (Patented June 28, 1870), but long proven in Siskiyou county, Cal., owes its efficiency entirely to its remarkable power of INCREASING THE INSENSIBLE PERSPIRATION, or, in other words, the VAPORY EXHALATIONS from the millions of minute pores of the EXTERNAL SKIN, from the crown of the head to the sole of the foot, it is all important that the direction to pass a sponge, or towel, dampened with saleratus water, under the clothing, twice a week, or oftener, be attended to.

Also, that when taken by LADIES, for IMPROVING THE COMPLEXION, for which it is very successful, that it should be in half doses, often repeated; and that one of the Pills of Citrate of Iron and Gum Myrrh, which erehence the bottom label of each bottle, be taken at night, much aiding in restoring Color in the Checks and Lips. To CHILDREN also, give it "little and often." It is agreeable to them any way, but especially if sweetened a bit; and it is admirably suited to their Diseases, which generally are those of the MUCOUS MEMBRANES.

FOR the irritated throats of PUBLIC SPEAKERS, Lawyers, Ministers, Teachers, and

FOR driving off threatened CONSUMPTION and Asthma, all Colds and Coughs;

FOR irritated Stomachs, from Bad Liquor, Alkali Water, Strong Coffee, Saleratus Bread;

FOR humors on the Skin, or MUDDY COMPLEXIONS, or, in a single sentence,

FOR all Diseases of the MUCOUS MEMBRANES, the Surest, and by far the

MOST PLEASANT MEDICINE yet found, in its TASTE and EFFECT, is

DR. FURBER'S CORDIAL OF MOUNTAIN BALM —AND— OREGON GRAPE,

Two Plants, abounding on the base of, and on the
Mountains surrounding

MOUNT SHASTA, CALIFORNIA,

For all of the purposes of the various PREPARATIONS OF SARSAPARILLA, richer in quality and more efficient as a RESTORER OF GOOD BLOOD, and acting equally as surely,

and as well on the LUNGS as on the STOMACH, is superior to other COUGH MEDICINES, by bringing BOTH to bear with the stimulated action of the WHOLE SKIN in throwing off Disease of either.

FOR SALE AT SAN FRANCISCO BY
R. H. McDONALD & CO., Druggists.

INVALIDS of any of the classes named above will find this worthy of TRIAL. Its virtues, as above asserted, not being visionary, but improved from the SHASTA INDIANS' knowledge and use of these PLANTS for centuries back, made known by them to us.

Such an Invalid, residing at a distance, wishing to try it, had better procure a package of one-fourth of a dozen, which can be done by sending in letter to the above a \$5 greenback, and directing that the package should be sent by WELLS, Fargo & Co's EXPRESS to that office which is nearest to the invalid's residence, and that person will be sure to get it.

PAIN KILLER
PROF.
DAVIS & SON'S PROVEDENCE REMEDY
1840 1870

This celebrated medicine has won a deservedly high
reputation as an alleviator of pain and a preserver of
health. It has become a household remedy, from the
fact that it gives immediate and permanent relief. It is
a purely vegetable preparation, made from the best and
purest materials, safe to keep and to use in every fam-
ily. It is recommended by physicians and persons of all
classes, and to-day, after a public trial of thirty years—the
average life of man—it stands unrivaled and unex-
celled, spreading its usefulness over the wide world.
Its large and increasing sale affords positive evidence of
its enduring fame. We do not deem it necessary to say
much in its favor as one small bottle will do more to
convince you of its efficacy than all the advertisements
in the world. Give it one fair trial and you would not
be without it for ten times its cost.
Directions accompany each bottle.
Sold by all Druggists.
Price 25 cts., 50 cts., and \$1 per bottle.

the earlier machines the arrangement was exactly the same as in an ordinary syringe, as shown in Fig. 1, but it was found that the fluid pressure of the metal within the syringe created such an inordinate amount of friction upon the inner surface as to rapidly wear out the several parts; but by a slight modification, more in accordance with sound principles, the defect has been obviated.

In the arrangement shown in Fig 2, the piston contains the orifice, and in pressing against the upper surface of the metal, causes it to remain in a state of rest within the containing vessel; but as fluid pressure is equal in every direction, the solid finds the orifice as a point of less resistance, hence it flows outward in a continuous stream, thereby avoiding the friction of the solid lead within the cylinder. It will thus be observed that a rod of lead or tin can be squirted of any form or dimensions, depending on the die or orifice. In the Royal Arsenal may be seen lead thus squirted into continuous rod, and then wound upon reels like yarn, to be again unwound and made into bullets by self-acting compressing machinery; but the whole of the several processes are entirely due to the flowing property. Man's mechanism is subordinate, and may be varied to any extent as circumstances may require.

Pipes are made with the same facility as rods, by the mere insertion of a steel pin, the size of the required bore, placed in the bottom of the cylinder, and exactly in the center of the orifice, thus forming an annular space through which the metal flows outward as a continuous pipe; or, by making this pipe of sufficiently large diameter, and then cutting it open by a stationary knife as it leaves the machine, the pipe becomes a sheet of lead, which, by means of suitable rollers, may be wound on a reel as a long web of sheet lead, or the sheet lead may be rolled out by rollers. In both ways the same mechanical work has to be done; the respective friction is a disputed point.

A very singular result was obtained by an attempt to squirt brass pipes, which are extensively used as steam boiler tubes and for gas-fitting purposes. This brass consisted of 60 parts of copper and 40 parts of zinc, and of various other proportions, but, singular to relate, the pipes so squirted were zinc rather than brass; the most of the copper remained in the vessel and refused to flow. We are not to infer from this that the copper would not flow, but rather that the union between the zinc and the copper was less than the pressure necessary to make the copper flow; the mixture may have been more mechanical than chemical, or the temperature may have been such as to have had the zinc too near its melting point. Whatever is the explanation, the subject is well worth further experiment. In any such operation, the nearer the lead or other metal is to the liquid state, the easier it is accomplished; but it must be solid.

Lead or tin may be rolled out to any extent, either singly or both combined, or with a thin coating of other metal upon one or both sides of the lead, so as to have a leaden substance, but yet covered with a tin surface, perhaps not thicker, if so thick, as the leaf called tinfoil, thus combining economy, with scarcely any disadvantage, for many purposes.

A beautiful illustration of the flowing property of tin is shown in the manufacture of the German capsule, in which the paint for artists is made up for sale and use. A button of tin, as in Fig. 3, is laid in the recess of a die in a fly press; a corresponding punch or die, a little smaller, is then brought down upon it with a smart blow, thus leaving, from the difference of dimensions, an annular space between them, when the metal at once squirts up like water, but at a velocity much faster than the eye can follow, thus converting it into a perfect capsule. The form of the punch and die depends upon the article to be made, but in all provision has to be made for the admission of the atmosphere on the removal from the dies.

From these remarks it will be seen that, by understanding a few of the natural properties of these metals, how completely they are under man's control, and, by knowing the simple laws, he can modify the apparatus in thousands of different ways, in order to produce whatever may be required.

Mr. R. O. OLD, of the Terrible mine, thinks that Colorado will export only about 600 tons of ore, with the present cost of transport, during the next year. With lower charges, it would be much greater.

KANSAS CITY thinks itself the best location for smelting works for western ores.

Lode and Placer Claims.

The following are the instructions issued by Commissioner Wilson on this subject. We have already published the bill referred to.

Circular

In relation to the survey and entry of mining claims under the provisions of the Act of Congress, approved July 6th, 1866, "granting the right of way to ditch and canal owners over the public lands, and for other purposes;" and the Act amendatory thereof, approved July 9th, 1870.

DEPARTMENT OF THE INTERIOR,
GENERAL LAND OFFICE, Aug. 8th, 1870.

Gentlemen: The original mining Act of July 26th, 1866, U. S. Statutes, vol. 14, p. 251, having been amended in adding to its provisions additional sections twelve to seventeen, inclusive, by the Act of Congress, approved July 9, 1870, it becomes my duty to prescribe for your information and observance the following regulations, to wit:

1st. By the 12th section of the amendatory Act, Placer claims, including all forms of deposit, except veins of quartz or other rock in place, are made subject to entry and patent under similar circumstances, conditions, and like proceedings as contemplated in the original Act for vein or lode claims.

Placer claims on surveyed lands, are authorized to be entered by legal subdivisions, no special survey or plat in such case being required, at the rate of two dollars and fifty cents per acre. In regard to Placer claims, however, the amendatory law restricts their extent in respect to locations made after the date of its passage, not to exceed one hundred and sixty acres for any one person, or association of persons; such location being required to conform to the Government surveys, and not to interfere with any bona fide pre-emption or homestead claims upon agricultural lands.

2d. The Act further provides for the subdivision of forty-acre legal subdivisions into ten-acre tracts, and authorizes two or more persons, or association of persons having contiguous claims of any size, although less than ten acres each, to make joint entry of such minor subdivisions, all bona fide pre-emption or homestead claims upon agricultural lands being protected by law. The Surveyors General are therefore hereby authorized to have such subdivisions into ten-acre tracts made by their Deputies when applied for by claimants, numbering each ten-acre tract with consecutive numbers of claims in the township, as in the case of other mineral surveys, and if the service is performed by county or local surveyors, as authorized by the 16th section of the amendatory Act, it will be the duty of the Surveyor General to verify the surveys so executed, and if found correctly done, to adopt the same and certify the fact, appending his approval as in cases where surveys are made under his own direction. The expense of such subdividing is required to be defrayed by the mining claimants.

3d. In the thirteenth section it is declared that in the absence of any adverse claim where said person or association, they and their grantors shall have held and worked their said claims for a period equal to the time prescribed by the statute of limitations for mining claims of the State or Territory where the same may be situated, evidence of such possession and working of the claims for such period shall be sufficient to establish the right to a patent thereto, subject to any lien which may have attached to such claim prior to the issue of said patent.

The foregoing provision is construed to apply as well to lode as to placer claims, and should lessen the amount of proof usually required to establish a right to a patent.

4th. In the fourteenth section it is declared that all ex parte affidavits required under the original and amendatory Acts may be verified before any officer authorized to administer oaths within the land district in which the claims are situated.

5th. By the fifteenth section it is declared that Registers and Receivers are entitled to the same fees for service in mining cases, as are provided by law for like services under other Acts of Congress, the rates of allowance being specifically given under our circular dated July 21st, 1870.

6th. By the sixteenth section the interdiction placed by the Act of March 3d, 1853, "that none other than township lines shall be surveyed where the lands are mineral," is repealed; this provision of law being referable to surveys in California only; the extension of the lines of future surveys over the lands mentioned in this section applies exclusively to this State. The requirement, however, in the last proviso of the same section, "that nothing contained shall require the survey of waste or useless lands," is a principle of general application and Surveyors General will refrain from extending the lines of public surveys over such waste lands which are considered to be those covered by alkali to a depth calculated to prevent the growing of crops, moving sand, or other sandy plains of great extent, and abrupt or snowy mountains not known to contain mineral deposits.

7th. Section seventeen authorizes the extension of the rights conferred by sections 5, 8, and 9 of the original Mining Act, to all public lands affected by this law, and subjects all patents granted or pre-emptions or homesteads allowed, to any vested or accrued water rights, or rights to ditches and reservoirs used in connection with such water rights as may have been acquired under, or recognized by, the said ninth section, said section declaring further that nothing in the act shall be construed to repeal, or in any way affect, the Act granting the right of way and

other privileges to aid in the construction of a draining and exploring tunnel to the Comstock lode in the State of Nevada, approved July 25th, 1866, U. S. Statutes, volume 14, p. 242.

8th. The per diem allowance to Deputy Surveyors including all expenses of assistants, for surveys of mineral claims, as stipulated in our circular letter of January 14th, 1867, has been in several cases found inadequate, and that, consequently, parties in order to induce Deputies to make the surveys have found it necessary to pay additional sums as on private account. To avoid such results the Surveyors General are hereby authorized to increase the maximum per diem allowance according to the difficulty of the service, taking care, however, to have the work performed on the most economical scale by skillful and responsible surveyors, and in no case to exceed a maximum of \$20 per day.

In each case where an allowance is made of over \$10 per day, the reasons showing the necessity for doing so must be stated in the contract and then reported to this office, and it must be understood that no extra compensation, under any circumstances whatever, is to be exacted or received by the deputy upon penalty of forfeiting the contract and exclusion from the public surveying service.

SPECIAL INSTRUCTIONS RELATIVE TO OBTAINING PATENTS FOR MINING CLAIMS.

With reference to the proceedings necessary to obtain patents for lode or placer claims under the provisions of the Acts of Congress above mentioned, the following is communicated:

9th. The mining enactments limit the right to apply for and receive patents for mining claims to claimants—

First. Who have occupied and improved their claims according to the local customs or rules of miners, or—

Second. Who have, by themselves or their grantors, held and worked their claims for a period equal to the time prescribed by the Statute of Limitations for mining claims of the State or Territory where the same may be situated.

Third. Who have expended in actual labor and improvements upon their respective claims an amount of not less than one thousand dollars and—

Fourth. In regard to whose possession there is no controversy or opposing claim.

Unless, therefore, applicants for mining patents are properly within these requirements, they are not in a condition to avail themselves of the privileges extended by the laws referred to.

THE APPLICATION.

10th. This must be in writing, and must be filed in the office of the Register and Receiver of the Land District in which the claim lies. It must distinctly state the name of the applicant and whether the claim is applied for by an individual, an association, or an incorporation; the name and extent of the claim; the character of the ore; the mining district, county and State; the date of its original location according to the mining customs; where the same was recorded; whether the applicant claims as a locator or purchaser; give a description of the premises claimed, and the nature of the improvements made, or labor performed; and finally the application should state that the claimant has posted a "Diagram" of the claim in a conspicuous place thereon, together with a notice of his intention to apply for a patent, giving the date of such posting.

11th. With the above application the claimant must file a copy of the "Diagram" posted on the claim, which diagram must represent the boundaries of the premises, as fixed by the local laws, customs or rules of miners, and when the claim lies upon surveyed land, it must also show its relation to the public surveys.

12th. Diagrams of PLACER claims upon surveyed lands must represent the subdivision of the public lands which the claimant desires to enter, as the Act requires such entries, in their exterior limits, to conform to such legal subdivisions.

13th. With said diagram must be filed a copy of the "Notice" posted upon the claim.

This should state the name of the claimant, describe the claim, give the names of adjoining claims, or if none adjoin, the names of nearest claims; state whether it is a placer or rock claim; if the former, the approximate area, if the latter, the estimated extent of surface ground, and the number of feet claimed on the course of the vein, distinctly stating the name of the lode and the character of the vein exposed; the mining district, county and State in which it lies; whether upon surveyed or unsurveyed lands; if the former, in what section, township and range; if the latter, the location of the claim relatively to some known natural object or landmark in the vicinity; and finally the notice should state that it is the intention of the claimants to apply for a patent for the premises therein designated and upon which it is posted.

14th. There should also be filed with the application satisfactory evidence that the applicant has the possessory right to the claim agreeably to the local laws or customs of miners. This should consist of a certified copy of the laws or customs of the miners of the district in force at the date of the location of the claim, and of a certificate, under seal, of the County or Mining Recorder, giving a copy of the record of the original location of the claim, with name or names of the locators, and if the applicant claims as a purchaser, an abstract of the title should be filed, tracing the right of possession from the original locators to the applicant for patent. Where applicants furnish satisfactory evidence that they and their grantors have held their claims for a period equal to the time pre-

scribed by the statute of limitations of mining claims of the State or Territory where the same may be situated, such evidence being sufficient to establish a right to a patent for a claim so held and worked, upon compliance with the other provisions of the law and instructions, the proofs enumerated under this subdivision, (14,) of the instructions are not required.

(TO BE CONTINUED.)

Solid Beer.

The Englishman and the German retain their love of their beer, in whatever clime they may wander. But they can nowhere else find that article so good as in their native countries. It will interest many to know that a German invention for concentrating the wort and making the beer from the "grainstone" has been transplanted to England, and that a large factory for working the process has been started at Margate, so that henceforth one can order his beer "in the lump." We find an account of the manufacture in the *Australasian*, a paper published at Melbourne, which contains an immense amount of reading matter (and most varied and excellent matter it is), some 23 pages in each number. According to this account, the malt is placed in the mash tub, hops are added to the sweet-wort, and the liquor is allowed to cool and clarify, according to the usual practice. At this point, however, the liquor is sucked up into a vacuum where it is kept in a rotary motion, and then transferred into a smaller vacuum pan and treated similarly until it assumes a pasty consistency. Thence it falls, at the proper time, for a considerable distance, thereby becoming more concentrated, and finally is pounded in a pasty state into boxes lined with tin and hermetically sealed. All that the consumer now has to do, is to break off a proper-sized piece, to add the requisite amount of water and some yeast, and, when the beer has fermented, to rack it off into casks. The resulting liquor is excellent and would cost about 21 cts per gallon in Australia. Unless the customer chooses to adulterate it himself, he cannot fail to have a beverage of pure malt and hops, which is something in this age of mixtures.

NEW SMELTING FURNACE.—We learn from the *London Mining Journal* that Mr. G. Metcalf of the Pertusola Foundry, near Spezia, Italy, has invented a new lead smelting furnace which is successfully operated. A reverberatory furnace is divided longitudinally for a portion of its length by a vertical partition or wall extending upward to the crown of the furnace, but not extending to the grate, so that a chamber with a bed is left near the fire-place extending the entire breadth of the furnace. The furnace bed is constructed by preference of a peculiar curved form and has a false door fastened parallel to the tapping door, the interval between the two being filled with bone-ash or similar substance. This last is for the purpose of getting out all the lead, in case the bed leaks or is destroyed. The two compartments formed by the partition have at their ends arrangements for opening and closing communication between them, and flues leading thence to the chimney. The charges are placed in these compartments and gradually fed towards the fire until they get close to the fire-bridge when the greater part, melted to a slag, is removed. The lead formed is tapped out. The draft is shut off from each compartment alternately, thus exposing the charges to alternating influences. It will be readily understood, says the description, [but we don't readily understand it] that, as already stated, [but it has not been already stated] four charges are continually under treatment—two on the preliminary side of the partition and two on the finishing side. The charges average 1½ tons of ore and a charge is drawn every six hours. The result is declared excellent by competent judges. The loss by volatilisation is uncommonly small and the saving of fuel is enormous, 5 tons with this furnace doing quite as much work as 26 or 28 with the old kinds.

Best Illustrated Newspaper
—FOR—
PACIFIC COAST READERS.

The Scientific Press,

[ESTABLISHED 1860.]

A large Illustrated, Practical Scientific
Homo Journal, devoted to

Mining, Farming, Mechanic Arts,
AND INDUSTRIAL PROGRESS.

Each weekly issue contains 16 pages (size of Harper's Weekly), except our double sheet, published on the first week of each month, which comprises 24 pages. It is ably edited, and contains, in concise and desirable form, all the most important discoveries, inventions, improvements and developments in the various branches of Science, Mechanic Arts and Industrial Pursuits, interesting to all intelligent readers on this coast. We make a live paper for the times, using plain, comprehensive language, giving information which cannot be had from books, or so readily and cheaply obtained from any other source. Each number often furnishes profitable hints to the reader worth many times its annual subscription price. Please examine sample copies and subscribe at once and you will not regret it.

Terms, for six months, \$2.50; one year, \$4—payable in advance. Sample copies of the Press and illustrated Patent circulars sent free on receipt of postage stamp.

HAVING had numerous applications to purchase the right to manufacture CHAMPAGNE MEAD (the great temperance drink), we will state that we are now prepared to sell State and County Rights on reasonable terms.
San Francisco, July 10, 1870. KENYON, GARR & CO. 2/21-3m

A GENTLE WHISPER TO MOTHERS.—If unfortunately you have lost your own teeth or neglected or mismanaged, take care that your daughters do not suffer the same penalty from the same cause. See to it that they brush their teeth regularly and thoroughly with NOZONOT and thereby you will insure them sound and serviceable sets as long as they live.

"SPALDING'S GLUE," handy and useful.

A GRAND ENTERPRISE has been started in Nevada City in aid of the Nevada School District. The highest Prize is \$10,000 Gold Coin. Every other ticket draws a prize. The scheme is a very liberal one, and the Managers are among the most respectable citizens of Nevada. The Nevada city paper speak in the highest terms of this Enterprise. See advertisement in another column and do not forget it when read.

THE Scientific Press is devoted specially to matters machinery, inventions and processes pertaining to the development of mines, and gives free and full discussions of such matters. Terms, \$4 per year.—White Pine News, May 10.

Mining and Company Advt's.

Silver Sprout Mining Company.—Location of Works and Mines: Kearsego District, Inyo County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 29th day of August, 1870, an assessment of twenty-five (25) cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary, at the office of the Company, No. 408 California street, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on the eighteenth day of October, 1870, shall be deemed delinquent, and will be duly advertised for sale by public auction, and unless payment shall be made before, will be sold on Thursday, the first (1st) day of December, 1870, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

T. B. WINGARD, Secretary, Office, 408 California street, San Francisco, Cal. 1/17

Mountain City Mining Company.—Location of Mine: Cope District, Elko County, State of Nevada.

Notice is hereby given that at a meeting of the Board of Trustees of said Company, held on the 29th day of September 1870, an assessment of fifty cents per share was levied upon the capital stock of said Company, payable immediately in United States gold coin to the Secretary at the office of the Company, No. 206, Front Street.

Any stock upon which said assessment shall remain unpaid on the seventh day of November 1870, shall be deemed delinquent, and will be duly advertised for sale by public auction, and unless payment shall be made before, will be sold on Monday the 28th day of Nov. 1870, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

T. B. WINGARD, Secretary, Office, No. 206, Front Street, San Francisco, Cal. 1/17

Columbus Mining Company.—Location: Roach Hill, Placer County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty-eighth day of September, 1870, an assessment of seventy-five (75) cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary, 419 California street, San Francisco, California.

Any stock upon which said assessment shall remain unpaid on the second day of November, 1870, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Saturday, the nineteenth day of November, 1870, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

A. NOEL, Secretary, Office, 419 California Street, San Francisco, Cal. 1/17

La Blanca Gold and Silver Mining Company. Location of Works: District of Ures, State of Sonora, Mexico.

Notice is hereby given that the annual meeting of the Stockholders of the above named company will be held on Monday the tenth day of October 1870, at the office of the Company, No. 312 Front Street, San Francisco, California, for the purpose of electing Trustees for the ensuing year, and for the transaction of such other business as shall properly come before the meeting. By order of the President, JOS. GOLDMAN, Secretary.

Land Purchasers' Association.

NOTICE.—At a meeting of the Board of Trustees of the Land Purchasers' Association, held Oct. 1st 1870, the following resolution was adopted by unanimous vote:

Resolved, That an assessment of ten dollars per share, gold coin, be, and the same is hereby levied, upon each and every share of the capital stock of the Land Purchasers' Association now held by subscribers thereto; being for the monthly installment falling due and payable Oct. 1st, 1870. Said assessment is payable on or before the thirtieth day of Oct. A. D. 1870, to JAMES F. CROSETT, Secretary, at the office of the Association, No. 304 Montgomery street, San Francisco. Any stock upon which said assessment shall remain unpaid on the thirtieth day of October, 1870, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on the 26th day of November, 1870, to pay the delinquent assessment, together with costs of advertising and expenses of sale. J. F. CROSETT, Secretary. 1/17

To Hydraulic Miners.

Last season I patented my improved discharge pipe for Hydraulic Mining. I manufactured and sold six of them. They were used by the parties whose answers to inquiries as to merits or demerits, find herewith appended.

Holding such opinions it is not strange that Gold Run miners think the PRESS correspondent got things slightly mixed when he represented them as preferring Craig's Globe to the Dictator.

RECOMMENDATIONS:

Your Patent Discharge Pipe known as the Dictator exceeds my expectation. I am now using a 4-inch nozzle at 250 feet pressure and can move my pipe in any direction with one hand. I consider it a perfect success and far ahead of the Globe Joint.

H. KELSEY, Jehosophat Co., Dutch Flat.

I fully endorse Mr. Kelsey's opinion and intend to use the one I have on my upper bench and get one of your large ones for the bottom next season.

J. PHILLIPS, Central Co., Dutch Flat.

Your Dictator gives perfect satisfaction. Get me another ready against water comes.

W. JUDD, Ind. Hill, Gold Run.

The Dictator is a perfect success. I shall want two for the Kearsago Claim next season.

H. H. BROWN, Gold Run.

Get me two Dictators of the large size ready against next season. I shall run both at Indians Hill and lay aside the small one I have. This is sufficient answer as to how I like my pipe.

JASON RINKS, Indiana Hill.

I pronounce the Dictator ahead of the Globes. I would perhaps use Craig's Globe if I could get nothing else. I am working at over 300 feet pressure and using a 4-inch nozzle, yet can move my pipe easily with one hand.

W. O. BROWN, foreman, Golden Gats and Church Claims, Gold Run.

We want you to get ready for us two more of your large size Dictators for the Cedar Claim against next season.

BROGAN & CO., Gold Run.

These joints being protected by letters patent dated June 1870, I will prosecute all parties infringing whether by manufacture or use.

I will guarantee against all suits for infringement by parties holding untenable patents and wishing by threats of law to secure by intimidation a monopoly for an inferior article. For particulars apply to

R. HOSKIN, Dutch Flat, Placer Co. 15/212t

LEA & PERRINS'

CELEBRATED

Worcestershire Sauce.

Declared by Connoisseurs to be the only good SAUCE. The success of this most delicious and unrivalled Condiment having caused certain dealers to apply the name "Worcestershire Sauce" to their own inferior compounds, the public is hereby informed that the only way to secure the genuine is to ask for LEA & PERRINS' SAUCE, and see that their names are upon the wrapper, labels, stopper and bottle.

Some of the foreign markets having been supplied with a spurious Worcestershire Sauce, upon the wrapper and labels of which the names of Lea and Perrins have been forged, L. and P. give notice that they have furnished their correspondents with power of attorney to take instant proceedings against manufacturers and vendors of such, or any other imitations by which their right may be infringed.

Ask for LEA & PERRINS' Sauce and see name on wrapper, label, bottle and stopper.

Wholesale and for export by the Proprietors, Worcester, Cross and Blackwell, London, &c., &c. and by Grocers and Oilmen universally. Agents, CROSS & CO., San Francisco. 1/20-1/20w

THE ASPHALTUM PRESSURE PIPE COMPANY,

HAVING ERECTED A MANUFACTORY of sufficient capacity to supply their Asphaltum Pipe in large quantities.

Are now Prepared to Take Orders AND MAKE CONTRACTS.

This Company will manufacture Pipes and guarantee it to stand any pressure required; it is lighter than iron pipe and more durable, it is not affected by chemical action, cannot corrode, and being glazed imparts no disagreeable taste to water. To miners and farmers it is invaluable; any body can put it down; it is twenty per cent cheaper than iron pipe and ten times more durable. For further particulars, apply at the office of the Company, Room No. 2, 645 Market street. 16/21-tf

TO MINERS, MILLMEN AND METALLURGISTS. Kustel's new work on the Concentration of all kinds of Ores, and the Chlorination Process, for Gold-bearing Sulphurets, Arseniurets, and Gold and Silver Ores generally, is the best and most complete work issued. It contains 120 diagrams, illustrating machinery, etc., which alone are of the greatest value. Price, \$7.50, postage paid. Published by Dewey & Co., publishers of the Scientific Press, San Francisco.

MARAVILLA COCOA.—For Breakfast.—The Globe says: "Various importers and manufacturers have attempted to attain a reputation for their prepared Cocos, but we doubt whether any thorough success has been achieved until Messrs. Taylor Brothers discovered the extraordinary qualities of 'Maravilla' Cocos. Adapted to their perfect system of preparation to this finest of species of the Theobroma they have produced an article which supersedes every other Cocoa in the market. Entire solubility, a delicate aroma, and a rare concentration of the purest elements of nutrition, distinguish the Maravilla Cocoa above all others. For homeopathic and invalids we could not recommend a more agreeable or valuable beverage." Sold in packets only by all Grocers, of whom also may be had Taylor Brothers Original Homoeopathic Cocoa and Soluble Chocolate. Steam Mills—Briok Lane, London. 16/20-1y

NOVELTY MILL AND GRAIN SEPEARATOR.

THE undersigned having purchased of the Patentees, WIRTS & SWIFT, of Hudson, Michigan, their right to this mill, Patented June 23d, 1869, for California, Oregon, Washington Territory, Montana, Utah, New Mexico and Arizona, wishes to call the attention of FARMERS, MILLERS and GRAIN DEALERS to one of THE GREATEST IMPROVEMENTS OF THE AGE for cleaning and separating grain. While it combines all the essential qualities of a first-class FANNING MILL, it also far exceeds anything that has ever been invented for the separation of grain. It has been thoroughly tested on all the different kinds of mixed grain, separating all the different small and cut kernels, such as merchantable wheat, is deposited in another compartment. By the use of this mill a great quantity of wheat usually sown that has been cleaned in the common mills will be saved to the farmer, as the cut or shrunken kernels will never germinate.

The above mentioned Novelty Mill is the only mill known to possess all these superior qualifications, and was exhibited and tested at the last Michigan State Fair held at Jackson, Michigan, September 21, 22, and 23, 1869, and here away the palm over some thirty other different mills from all parts of the United States, including the famous Dickey Mill of Racine, Wisconsin. All who have witnessed here the operations of the NOVELTY MILL, declare it perfection, and the most beneficial invention to the Farmers, Millers, and Grain Dealers ever introduced on the Pacific Coast. The farmers in Santa Clara County, are loud in its praise, and also in other parts of the State where it is being introduced. No. 1 Mill, complete, is capable of cleaning 25 tons of grain per day. No. 2 Mill, 15 tons; No. 3, M1, 8 tons. A large number of recommendations and certificates of the practical working of the mill will be furnished. Circulars containing references sent free by mail. N. B. Town, County, or State Rights for sale on favorable terms. For further particulars apply to

THE WILSON

Patent Steam Stamp Mill.

This extraordinary Mill, now so justly popular in the East, is now offered to the miners of the Pacific Coast. Having been in operation now for about two and a half years, the Company feel confident that the

WILSON STEAM STAMP MILL,

For Durability, Efficiency,

AND ECONOMY OF WORKING,

HAS NO EQUAL.

The Wilson Steam Stamp Mill is the only Steam Mill that has had the severe ordeal of practical working, and proved itself eminently successful. It is now in operation in several of the Eastern States and Territories, and gaining an evens popularity. The whole machine is so simple as to be readily understood by the most ordinary minds. In fact, its simplicity is its durability. The expense of crushing rock or cement with this Mill is less than one-half the expense of any other Stamp Mill, and less than one-half the cost. For further particulars inquire of

FURMAN R. WILSON,

San Francisco.

Or of THE WILSON STEAM STAMP MILL CO., 326 Walnut street, Philadelphia, Pa.

NOTICE.—All persons are hereby warned not to manufacture or use any Steam Stamp Mills that are an infringement on the Wilson Patents, as they will be prosecuted to the utmost rigor of the law.

F. R. WILSON,

20719-1f Supt. W. P. S. S. M. Co., Philadelphia.

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared, to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits. They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the miller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Settlers made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill-men are invited to examine these pans and settlers for themselves, at the office, 229 Fremont Street, San Francisco.

PATENTS BOUGHT AND SOLD ON COMMISSION.
Barnes' Thill Holder.

This coupling can be attached in a few minutes and it is absolutely certain that it will not release itself while the horse is attached. It is durable, noiseless, in good taste, and in short, a perfect Thill Coupling in every respect. The best recommendation that we can send out is the Coupling itself. A full set will be sent to any one for \$5, and the money will be returned if they are not liked. Shop Rights for sale.

Dennis Combination Gridiron.
No one who has studied the laws of Health will fail to appreciate this valuable culinary implement. It is well adapted for cake baking and other purposes, as well as for broiling meats. Foundry-men will find it to their advantage to examine it. The right to manufacture and sell is for sale cheap. Send for circular, or call and see sample Gridiron.

Steam Cooker.
This simple and practical Cooker can be attached to any Cooking Stove, and prevents the possibility of scorching or burning food. It facilitates cooking and saves fuel. Don't fail to call and see the model or send for descriptive circular.

P. Davis' Wire and Picket Fence.
Although about two hundred different styles of fences have been invented and patented in the United States within the past ten years, yet this Fence, for GENERAL FARM USE, stands at the head of the list. This is a Virginia invention, and the actual cost of the Fence complete in that State is less than fifty cents per rod. Three men can put up six hundred yards per day. You men who are idle, why hang about the city talking hard times when you can make from five to eight dollars per day building this Fence? We will make a present of ONE FARM RIGHT in each county on the Pacific coast to farmers who will erect one hundred rods of the fence in good style within thirty days after the privilege is granted. We wish to employ several working men to travel in this State and Oregon. Price of territory, and circular with full description of fence sent on application.

New Gas Light.
This Light takes the place of the Candle, the Kerosene Lamp and Coal Gas. Each Lamp is a perfect Gas Factory, making its own gas as fast as it is required. It is a safe, cheap and beautiful light. Circulars and full particulars sent on application.
A few good traveling agents wanted to sell this and other valuable Patents.

Hold Your Horses!
By the use of "Burns Patent Safety Bridle" the wildest horses can be controlled with ease. The mildest hit is used and the horse's mouth cannot be injured.
No restive horse should be driven with any other bridle. Send for descriptive circulars, or call and see the Bridle. Shop Rights for Sale.

Hunter's Improved Grain Separator.
The best machine to Clean Grain in the world. Prices reduced. Send for descriptive circular and price list. County Rights for sale.

For Sale.
We have for sale the right to the Pacific Coast for the safest, cheapest, most compact and simple Engine and Hoisting Machinery for mining and other purposes ever invented. Although new it has been thoroughly tested and we have strong testimonials in its favor from many of the most substantial men of the East.
We invite manufacturers and others, to call at our office and make their own investigations.

Sheffield Scientific School
Of Yale College, New Haven, Conn.
This department of Yale College, instituted in 1820, and endowed with the National Land Grant in 1866, furnishes advanced instruction in the various branches of Mathematical, Physical, and Natural Science.
The School is under the direction of the President of the College, a Board of thirteen Professors in different specialties, and six assistant instructors.
Regular courses of study, leading to the degree of Bachelor of Philosophy, conferred by Yale College, are arranged as follows: 1—CHEMISTRY AND MINERALOGY. 2—CIVIL ENGINEERING. 3—MECHANICAL ENGINEERING. 4—MINING ENGINEERING AND METALLURGY. 5—AGRICULTURE. 6—NATURAL HISTORY AND GEOLOGY. and 7—SCIENCE COURSE.
Advanced students are also admitted to optional courses, and if already College graduates, are received as candidates for the degree of Doctor of Philosophy.
Tuition, \$125 per year of forty weeks.
The Libraries, Museums, Laboratories and Apparatus accessible to students, are varied and extensive.
For copies of the Annual Circular and Report, letters may be addressed to the "Secretary of the Sheffield Scientific School," New Haven, Conn.

SCIENTIFIC PRESS.

AN ILLUSTRATED JOURNAL OF SCIENTIFIC AND INDUSTRIAL PROGRESS,
Mining, Farming and Mechanic Arts.

BY DEWEY & CO.,
Patent Solicitors.

San Francisco, Saturday, October 22, 1870.

VOLUME XXI.
Number 17.

Mining Edition.

An Unheralded Charity.

Many a person passing through Genry Street has noticed undoubtedly, opposite the Unitarian Church, an unpretending sign, announcing the existence of a Homœopathic Dispensary, for the gratuitous medical and surgical treatment of the sick poor of all nations. Yet as no one has been called on to contribute to its support, and as nothing has been said in the public journals with regard to it, probably but a few have given it any thought, except the four hundred and forty-five poor who have received treatment there and the one hundred sick ones who, unable to go thither, have been visited by the attending physician.

Fifteen months ago, Francis Cutting Esq., of the firm of Cutting & Co., founded this institution, and has since provided from his own purse the funds necessary to meet the whole expenses, including the salary of a physician in constant attendance, the rent of three rooms, the cost of medicine, etc. That the Dispensary, under the charge of Dr. J. S. Beakley, has been quietly doing a large amount of good, we know personally. One item, the 1975 prescriptions given, may be noted in this connection. Still its founder has desired to extend its benefits to a much greater number, and has called to its aid the co-operation of all the Homœopathic physicians in this city, proposing at the same time to continue his liberal contributions towards its support. In response to the call last Saturday evening, Drs. J. N. Eckel, E. J. Fraser, J. A. Albertson, J. P. Diasmore, W. N. Griswold, J. J. Cushing, J. S. Beakley, M. J. Werder, J. Esten, L. Royer, J. H. Floto and Mr. W. Boericke (of the Pharmacy of Boericke and Tafel) met at the Dispensary and formed the Homœopathic Dispensary Association of the City of San Francisco, with Dr. J. N. Eckel as President and Dr. E. J. Fraser as Secretary.

In accordance with the plan then formed, the Dispensary will be open hereafter from 1 to 3 P. M. daily (except Sundays). Dr. J. S. Beakley will act as attending and visiting physician, being aided by the above named gentlemen in regular order every day. Dr. E. J. Fraser, moreover, will act as Dispensary surgeon. By this arrangement the sphere of action of the institution will be greatly extended, and to further its objects its friends (without the knowledge of the generous founder) have thought it proper to say a few words to the public in regard to the matter.

Double Acting Force Pump.

Stockton is a flourishing, lively place. It is noticeable that those who write letters concerning the city, manage always to dwell on the fact of its ovident business activity. Excellently situated in many respects, the center of trade for the San Joaquin Valley, its inhabitants seem not at all

inclined to let any advantage escape them through laziness.

Stockton is quite a manufacturing place. In it almost all classes of domestic manufacture are in successful operation. With its ship-yards, machine shops, tanneries, factories for wagoas, agricultural implements, etc., etc., it has an element of successful growth which cannot be over-estimated. To speak of these individually and in detail, we have no space. But our subject leads us to remark on one establishment, the Globe Iron Works, which is known extensively by the excellent articles which emanate from it. The proprietors, Messrs. Keep & Bargion, have a wide reputation as good machinists, and men who generally know all about their business.

KEEP'S PATENT GLOBE PUMP.

Their work speaks for them.

A recent invention by one of the partners, Mr. W. H. Keep, has excited considerable attention and elicited much praise at the various fairs which have lately been held in different localities in our State. While the fact of its being a California invention was sufficient to call attention to it, it must have appeared a superior article to have been mentioned so favorably as it has been. We give here an illustration of the pump.

The object of the invention is to form an improved double-acting force pump which, by a well devised general combination and arrangement of its parts, shall be made simple, cheap and effective. For this purpose the pump is constructed as follows:

The pump cylinder, A, the piston, B, and the rod, C, are of common form. The handle, D, is supported on a movable fulcrum post, so as to accommodate its movements to the direct motion of the piston rod. The supply passages, E, E, for the upper and lower parts of the cylinder are

to the valve chambers and are made to lap or pass each other (as shown in the sectional view) so as to use as little weight of metal as possible. The valve chamber, F, is formed on the side and midway of the length of the pump barrel, so that the water for each end passes over equal distances. This chamber has a vertical diaphragm, I, cast in the middle and is so formed that it is only necessary to plane off its upper and lower faces, when it is ready for the valves.

The cap, G, has an opening at the bottom with which the supply pipe connects. This cap can be planed or put into a lathe and faced. The air chamber, H, is formed so that its lower end forms a cup for the top of the valve chamber, and this is also faced to fit. This is all the fitting required

in the whole pump, except boring the cylinder. The parts are made large. The valves, J, may be ordinary binged valves, or of other suitable form.

By such a construction, it is possible to bring all four valves closely together, and thus to simplify the making of the valve chamber, so that everything is fitted by simply running it through the planer twice. Lugs, K, K, are made on the side of the valve chamber, and one bolt on each side will hold the parts firmly together.

It will be seen that the objects of the invention seem, certainly, to have been attained. Its simplicity, moreover, ensures durability and cheapness,—the cost of manufacture being said to be only about two-thirds of that of common pumps. A patent has been applied for, through the SCIENTIFIC PRESS agency, by Mr. W. H. Keep, of Stockton, Cal.

Fires in the Country.

According to custom, at this period of the year, extensive fires are burning in various places in the State. We have

previously made brief mention of the fact that conflagrations were raging in several localities, as they have occurred. During the last week or ten days, the inhabitants of this city have enjoyed (?) the sight of large fires on the foot-hills back of Oakland. Up at Calistoga a fearful one is reported. "All the grain fields," it was said, "fences and woods have been burned from Holmes' Ranch, in Knight's Valley, to Walnut station, five miles from Calistoga,—a distance of 10 or 12 miles. In the vicinity of Napa, nearly 10,000 acres have been burned. Fences, houses, barns and hay were in many instances destroyed, etc." The fires are originated by persons burning up brush wood in advance of the rainy season, by hunters and others. By these annual conflagrations, loss is occasioned to the value of thousands of dollars. Fences, crops, too often houses are consumed, to say nothing of the trees which are none too abundant in many localities. It is a sin and a shame that property should be destroyed in this wanton manner, that the carelessness of individuals should be allowed to injure others. If a farmer will not take the trouble to isolate his brush wood from his neighbors land, he should not be allowed to fire it. If the hunter will persist in lighting fires which he allows to spread anywhere, hunting in the neighborhood of fields and forests should be made a State Prison offence and punished accordingly. We have no objection against hunting in the proper season and manner, but if the hunter disregards all rights of property and humanity, if he destroys our crops, burns our fences, our farms and our houses, renders us liable to loss of life and property that he may amuse himself a few short hours, then we claim that the hunter should be excluded from all localities where there is valuable property, and should be held responsible for all loss occasioned by him.

Setting fire to a building in a city is recognized as a crime everywhere. Burning up property in the country is just as bad, and ought to be so considered by every individual. Being careless and having evil intents are so akin in their results that want of care ought to be punished as well as intentional crime. We enter our protest against this yearly wanton destruction. It affects us individually and affects us as members of the community. We have lived in a loose sort of way in many respects long enough; it is time to recognize the fact that the rights of others must and ought to be regarded.

We all desire to attract population to our coast. We advertise our grand advantages, explain our great possibilities. But we must not forget that the immigrant looks at both sides, and examines the probable losses as well as the probable gains. We must remember that he is apt to magnify the chances of misfortune and to lessen those of good luck; and we may take it as a fact proved by experience that the reports of such useless destruction will lose nothing by spreading to other countries.

Communications.

IN THIS DEPARTMENT we invite the FREE DISCUSSION of all proper subjects—correspondents alone being responsible for the ideas they advance.

All About Montana.

[WRITTEN FOR THE SCIENTIFIC PRESS.]

The Road to Cedar Creek Mines.

I left Deer Lodge City at 3 P. M., in one of Gilmer and Saulsbury's stages and, riding all night, reached Missoula City, (or Hell Gate) in time for breakfast. Then leaving this place (whither I shall return hereafter and about which I shall write you) the road leads up Missoula Valley for 18 miles to French Town, likewise marked by me for a future visit. [What our correspondent says about these places will be found in our agricultural columns. Eds.] From here we pass on over the famous Mullen's Road, built by the government in 1857 at a very great expense. This is a pretty tough road, winding up hill and down totally irrespective of grade. The passengers are often obliged to get out and walk, for the road is too steep for the horses to be able to pull them up. Why Mr. Mullen should have picked out just the route he did, when he might have easily crossed the river and found a much easier (and cheaper) way, no one knows. Perhaps he was fond of overcoming difficulties. Perhaps he wished to give the traveler the opportunity of seeing the grand scenery, to look up the huge mountains with their green sides covered with thick forests and to grow dizzy on the edge of steep cliffs. Whatever his reasons, he seems to have left the labor of the draft animals out of all consideration, and to have had no thought of the evil things now invoked on his head by the drivers.

At 6 P. M., we arrived at Superior City, at the mouth of Cedar Creek, a distance of 165 miles from Deer Lodge. Here we cross the river, which is 400 feet wide, on a ferry, and here stop for a night's rest after our hard ride. Messrs. Booth and Bourcsew are building a bridge, which will be 400 feet long and cost between \$3,000 and \$4,000. Superior City is a small place, about 17 miles from Louisville (the principal town up the creek) which very likely will get to be of considerable importance for the transportation of goods and passengers to the mines, which are reached on horseback, the stage company keeping a fine stock of animals. The agent is Mr. T. C. Jackson, who conducts himself in a kind and courteous manner.

After our night's rest we start, at 7 A. M., for the mines with mail bags, etc., strapped on the horses. We ride up the creek, which is beautifully wooded with cedar (whence the name), pine, fir, etc., over a very fair trail, considering the roughness of the country, and amid grand scenery. Ten miles on, we reach Cedar Junction, a small place, and the only post office in the canyon. Claims have been taken up along the road for miles, but we saw none worked until we arrived at this point. Here, however, I noticed miners busy prospecting and driving pits, for, as I am told, the bed-rock is very deep down here, and much work must be done in sinking shafts. Seven miles further up we reached Louisville, the largest place in the gulch, when the miners are hard at work on their claims. These claims, I may remark, are numbered from the Discovery in both directions. That is, there is a No. 1 above and a No. 1 below; a No. 2 above and a No. 2 below; etc.

Louisville.

Louisville is now a lively and important place, with a number of stores, saloons, etc., and one good hotel, all built of logs. A Post Office is to be established here this week, and this will be a great accommodation to the miners, for the mail boy charges 25 cents for bringing the letters up from Cedar Junction, although newspapers are free. The town is located on the steep side of a very high mountain, where it is much easier to roll down than to climb up. But the miners started it where it would be convenient to the mines and not with any more regard for street grades than your supervisors have in San Francisco.

I have traveled considerably about the Pacific Coast, as you well know, but the rough high mountains around this place rather go ahead of what I have before seen. The range is known as the Caewedolene mountains, and the sides incline at a tremendous angle (it looks like 40° to 45°) on the western slope. Exactly what the elevation of Louisville is, I don't know, for no observations have been taken, but I should imagine that it must be somewhere about 8,000 feet. The climate is healthy enough, but exceedingly cold in winter and cool in the summer and fall. Last winter and spring the miners could not work on account of the heavy snow and the boys had a hard time of it, without any trail. But things are fixed up quite comfortably now. All goods have to be packed up to this place, and the mules have already brought up a small safe and several billiard tables,—things which I have just seen,—besides other articles which one would more readily think of. The canyon and hills are so heavily timbered that

the miners are obliged to cut the trees down and burn them to get them out of the way. The population of the district is estimated at about 1,500.

The Mines—Forest City.

On my way up to Forest City, a small place some three miles above Louisville, I looked at the different claims. The bed-rock is slate. The deposits were discovered in October, 1869, by Lewis Barette and B. Lentier who own the Discovery claim, and No. 1 above and No. 1 below. These are on a small bar just below the city, and now employ 14 men. They yield, the owners tell me, nearly \$300 per day. The miners are paid \$5 in gold dust, which is coarse and worth from \$18 to \$21 per oz. According to the miners' law here, each claim is 200 feet running up the creek to each man.

No. 4 above is owned by Maizon and Co., who employ 8 men, and struck the pay streak last week. It is four to six feet from the surface to the bed-rock. They made a clean up last week of \$1,400. Nos. 13, 19, 20 and 21 are consolidated and owned by the Montreal Flaming Co., who have some 900 feet of flumes and are going to build 800 feet more, for washing their ground. At No. 29 four men are at work. It is 12 feet to the bed-rock, and the claim pays \$10 to the hand. Nos. 52, 53 and 54 are owned by Edmison & Co., who have 13 men at work. These three claims have paid \$200 daily. Nos. 55 and 56, owned by Minnesinger & Co., employ 9 men and pan out an ounce daily to the hand. This is not very deep (3 to 6 feet) and is considered excellent ground. Nos. 58 and 59, owned by Adkin & Co., have a shaft 30 feet deep and a tunnel run in to tap this and carry off the water, 18 men being employed night and day. The claims pay well, a clean-up of a 24-hours run while I was there, yielding \$500. This brings us up to Forest City.

Forest City is situated on a bar or what might be called a heavy wash, and here many are working and some prospering. The channel pays splendidly under this town and on up the creek in a straight line. But the stream winds its way some 300 feet below the place and there no pay has been found, although in the old channel it appears very rich, that is, under the city. There shafts are sunk and tunnels run, the pay streak being apparently some 70 feet wide and 40 to 50 feet down below the surface.

I must stop here to speak of one of those persons who are found here and there, doing unusual acts of kindness to the stranger and making all things pleasant for his neighbor. To Mr. H. O'Neil, who owns a claim near this place, I would return my sincerest thanks for many kind acts and favors extended to one who never met him before and who will never forget him hereafter. A true gentleman, in all senses of the word, and one for whom all wish success.

Up above this town the claims all have over-shot wheels or Chinese pumps for getting out the water where tunnels cannot be run. No. 60 has a shaft 55 feet deep and a tunnel 240 feet long. They have just struck the old channel and are confident that they have a good thing, after their expense of time and money. No. 61, Sullivan & Co., works 9 men, has a shaft 25 feet deep, struck the pay streak (supposed to be 100 feet wide here) Sept. 6th., and has yielded \$1.62 to the pan. No. 62, Smalley & Co., has 16 men working night and day, a shaft 25 feet deep, and pays \$10 to the hand daily. At No. 66, five men are employed, the shaft has been sunk 30 feet, pay has been struck, and drifting is going on, as in other claims. Above No. 67 many claims are being prospected vigorously, but they are not yet opened up, although the highest hopes are entertained of them. After visiting the claims, I returned to Louisville. W. H. M.

Notes of Travel in Nevada County.

[WRITTEN FOR THE SCIENTIFIC PRESS.]

North Bloomfield G. M. Co.

At Malikoff, one mile from North Bloomfield, are situated the office and principal works of the North Bloomfield Gravel Mining Company; capital stock \$800,000; all paid up; stock all held by citizens of San Francisco. The trustees are S. F. Butterworth (President and Treasurer), L. L. Robinson, Wm. E. Barren, Chas. I. Brenham, Thomas Bell, Andrew I. Moulter, Secy., A. M. Dohbin, Gen. Supt. The company own large and valuable gravel claims (about 1,500 acres) at North Bloomfield in Nevada County, about 13 miles N. E. from the City of Nevada on the road to Eureka South. They have constructed a ditch from Big Canyon Creek to Bloomfield, a distance of 40 miles, with a carrying capacity of 3,000 in. This ditch has cost about \$500,000, and is the best constructed and most substantial one in the State. They have also constructed a dam across Big Canyon Creek at Bowman's Ranch, 65 feet high, giving them a reservoir capable of retaining 400,000,000 cubic feet of water. In addition to this immense supply of water, the Company own several important water rights in the line of their ditch, which afford a large amount of water during the rainy season. They also own the Rudeyan reservoir, formerly owned by an English company, distant about 13 miles from the line of their present ditch. This is the largest reservoir in the State and cost the English company over \$100,000. From Bloomfield this company have constructed another ditch, 7 miles long, to Columbia Hill, to supply water to the Union Gravel Mining Company a majority of the stock of which is owned by the

North Bloomfield G. M. Co.

The mining claims of this Co. are at present fitted with pipes, etc., costing some \$40,000. Their network of mining flumes is about 1½ miles in aggregate length, varying in width from 40 to 72 inches. When these claims are running in their full capacity, they will be using 3 Monitors, each capable of carrying 1,200 inches of water; also what is known as a Goose-neck, carrying some 600 inches of water. These pipes are used under a head of 300 feet, and it is estimated that the capacity of the work is an ability to mine 100,000 tons of gravel each 24 hours. When the works are in full operation they will use about 80,000,000 gallons of water per day. The various flumes are so arranged that they can clean up, without stopping the work of mining. The main flumes are paved with stone, the branches with wooden blocks. The grade of the flumes is as a general thing 6 inches to each box of 12 feet, although some of them are upon a grade of 5 inches. The company have steadily prosecuted their work for the past 3 or 4 years, and when their subterranean works, now to be constructed, are completed, no one can doubt that great results will be obtained in the way of dividends. This company's new ditch was finished, and washing commenced September, 15th.

Giant Powder or Dynamite.

The giant powder, now an acknowledged necessity in all the counties I have visited so far, had to stand, like many other excellent inventions, the attack of that class of people, who are always opposed to new and labor saving inventions, in the belief that the workman will be thrown partially out of employment and consequently will suffer. The giant powder stood all these attacks of being injurious to health, too quick in its explosion and too explosive, etc., and came out triumphant. I have found that the consumption of this blasting agent, on account of its great strength and safety, is steadily increasing. The saving to mine owners in i with single hand drilling, is from thirty to fifty per cent, in their expenses. Mr. Geo. E. Turner in Nevada City, the agent for the sale of this powder, informed me of the increasing consumption of this article, even in such places where last year so much opposition was manifested to its introduction. The great success it has met with in so many mines should be sufficient guarantee to the few who are yet opposed to its use, that they have not given it the fair and impartial trial which should be accorded to every new invention.

I have no space to dwell any longer on this subject, and will merely state that the North Bloomfield Company used last year over five hundred pounds per month for a long time. Mine owners would do well to introduce the single hand drilling system in all places where it can be done to advantage, for it will reduce expenses without lessening wages and benefit the laboring classes by enabling owners of claims to re-open mines known to be good but now laying idle.

Between here and San Juan North are the villages of Lake City and Cherokee. But little or nothing is being done at either place. At Columbia Hill (or near there) the Union Gravel Mining Co. are driving business and just now making it pay. W. W. Nichols is Supt. and principal owner.

North San Juan and Vicinity.

There are at this time four mining claims in operation on San Juan Hill. 1st. Thos. Foster & Cos. claims on the northwest end of said hill. These have been worked since last winter and have the reputation of paying their owners fair dividends. 2d. The New England Cos. claims, situated on the north end of the hill, owned by E. Beach and others, are very nearly worked out. Owing to the cement in the same, the expense of working them has been great, eating up most of the profit. 3d. The claims of Bowen & Davis are on the south end of the hill, have uniformly paid a fair remuneration to the owners, who have but lately made some large additions to their ground, by purchase from owners of adjoining grounds. 4th. The Eureka Lake Ditch Cos. claims, are on the east end of San Juan Hill. This corporation is largely interested in claims here. Those which they are now washing, have been worked but a short time; hence but little can be said as to their value.

About one mile west from San Juan, near the little town of Sebastopol, is situated the celebrated American Mining Cos. claims, owned by Geo. C. Spauler, J. H. Brown, John H. Effinger & others. These claims are the largest and best paying claims on what is called here "the Ridge," which ridge embraces a vast tract of mineral land some fifteen or twenty miles in length. The said American Cos. claims are situated on what is known as Manzanita Hill. Every appliance useful and necessary in working a hydraulic claim is used by this company. They give employment to about 30 men. A few weeks ago they let a contract for the extension of their tunnel for a distance of 1,000 feet. (at a cost of about \$20,000,) which when completed will make the entire length of their dume between 2,500 and 3,000 feet.

Sweetland, Birchville and French Corral, have from two to four companies in each doing well; but as a great many idle men are visible around each, it goes to show that they have seen better days. At the latter named place two cement mills only are in operation. Ten or a dozen other companies are idle on account of water. Each work a few men preparing for winter rains. Rough and Ready is ready for anything to turn up to enliven it. Grass Valley and its mines will be the subject of my next. L. P. Mc.

The Origin of Life.

In Prof. Huxley's inaugural address before the British Association for the Advancement of Science, this subject and the various hypotheses with regard to it were admirably handled in the most interesting manner. We would gladly publish the address in full, but are obliged to condense, giving only the main outlines.

It is a matter of every day experience that it is difficult to prevent many articles of food from becoming covered with mold; that fruit, sound enough to all appearance, often contains grubs at the core; that meat, left in the air, soon putrefies and swarms with maggots. Even water allowed to stand in an open vessel, sooner or later becomes turbid and full of living matter. The old philosophers did not doubt but that the low forms of life were generated in the matters in which they made their appearance. The proposition that life may and does proceed from that which has no life, was universally accepted down even to the seventeenth century. Then the first distinct proposition that all living matter has sprung from pre-existing living matter came—just two hundred and two years ago—from a distinguished Italian, Francesco Redi, who attacked experimentally particular cases of supposed "spontaneous generation." If I expose dead animals or meat, he says, to the air in warm weather, in a few days they swarm with maggots. But if I put similar bodies, while fresh, into a jar and cover the mouth with fine gauze, not a maggot appears, while the dead substances putrefy as before. It is obvious, then, that the maggots are not generated by the corruption of the meat, but that the cause of their formation must be something which is kept away by the gauze; and as the gauze will not keep out aeriform bodies or fluids, this must exist in the form of solid particles too big to get through the gauze. There is no doubt what this is, for the blowflies, attracted by the odor, lay eggs, out of which maggots are immediately hatched, upon the gauze. The maggots, therefore, are not generated by the meat, but from eggs laid by the flies.

The theory that life can come only from life was now triumphant for nearly a century; for the application of the microscope displayed such complexity of organization of the lowest and minutest forms and such a prodigious provision for their multiplication by germs, that the opposite theory seemed absurd. But in the middle of the eighteenth century, Needham and Buffon took another view. When animal or vegetable matter is infused in water, it gradually coarsens and disintegrates and the water swarms with the most minute creatures, the "infusorial animalcules," invisible except under the microscope, and many of them only under the very strongest. Now, said Needham and Buffon, if these animalcules come from germs, these germs must exist either in the substance infused or in the water or in the adjacent air. But their vitality is destroyed by heat. Hence if I boil the infusion, cork it up carefully, cementing the cork with mastic, and then heat the whole vessel by heaping hot ashes over it, I must kill all germs present. And if, on cooling, animalcules appear, they must come not from germs but from the substance itself. The experiment was tried and the animalcules appeared when sufficient time was allowed. Then Buffon originated his hypothesis of "organic molecules,"—that life is the fixed property of indestructible molecules of matter, which exist in all living things and have inherent activities which distinguish them from not living matter. Each living organism is formed by their temporary combination, just as the particles of water form a cascade or whirlpool or any body of water. As the stoppage of a whirlpool destroys nothing but the form, leaving the molecules of water, with all their inherent activities, intact, so death and putrefaction of an animal or plant is merely the breaking up of the form or manner of association of its constituent organic molecules which are then set free as infusorial animalcules.

But the great, ever-recurring tragedy of science—the slaying of a beautiful supposition by an ugly fact—was played almost immediately for the benefit of Buffon and Needham. The learned Italian Abbe Spallanzani showed that Needham's experiments were questionable. Was the air completely excluded by the corks and mastic? and were the infusions and the air sufficiently heated? He showed that if the glass vessels were hermetically sealed by fusing their necks, and if they were exposed to the temperature of boiling water for ¼ hrs., no animalcules ever appeared, and the propositions of Buffon and Needham were annihilated.

But another change came. Chemistry had grown. It was shown that oxygen played an important part in supporting life. Now came the question, was it not possible that, in his experiments, Spallanzani had affected the organic matter of the infusions or else the oxygen? had checked or prevented, by these changes, the development of life which ought to have taken place. So in 1836 and 1837, Schultze and Schwann took up the matter. In their experiments they passed the air through red hot tubes or sulphuric acid, by which any organic matter in the air is destroyed, while the proportion of oxygen is not changed. They obtained no living things, while, if the same infusion was exposed to the air afterwards, such things appeared abundantly. These experiments, if accurate (which has been doubted) proved that the treatment destroyed something in the air which was essential to the development of life. This "something" might be gaseous, fluid or solid; that it consisted of germs was still only a supposition of greater or less probability.

(TO BE CONTINUED.)

Mechanical Progress.

WOODEN CARPETING.—The Boston *Cabinet Maker*, of Sept. 27th, describes a new article for carpetings and wainscotings, consisting of lath shaped strips of various woods glued together on a canvas bottom, and having the appearance of elaborate inlaid work. The strips are of carefully seasoned stuff, and are made of uniform thickness and width, and perfectly smooth, by a machine constructed for this special purpose. They are laid upon a table with metallic top, and pressed closely together; then thoroughly covered with glue; then with the canvas, which is well pressed down at every point. The article is more durable than oil cloth, and is neater and cheaper. For hospital flooring, it is spoken of as invaluable; it being as noiseless under the tread as a woolen carpet, while it is much freer from dust. It is already in favor.

THE WORTHINGTON PUMPING ENGINE.—The London *Engineering* illustrates the direct acting steam pumps lately constructed for the Newark, N. J., Water Works, the largest of the kind ever built, and in some respects peculiar. We quote part of the description:—"The single-acting air pumps are driven by rock shafts off the main piston rod, and are in a convenient and accessible position. The steam slide valves are carefully and simply balanced. The steam cylinder and cylinder heads are steam jacketed, and thoroughly lagged, though this is not shown in the engraving. The double-acting water plungers are hollow cylinders, with tight heads, their weight being thus nearly floated; and the water, entering the numerous suction valves below them, passes them in a nearly direct line into and through the discharge valves above. The valves are rubber discs, backed by iron, working vertically on fixed spindles. They are readily reached through the hand holes, and are purposely made numerous in order to subdivide any trouble from the possible failure of any one of them. The engine being horizontal, all the cylinders and other parts are most accessible for inspection and repairs, and great solidity and steadiness are insured to the machine. Each engine drives its plunger at a speed practically uniform throughout its stroke, during which it opens, by a rock-shaft and appropriate connexions, the steam valve of its neighbor, and is obliged to pause at the end of its own stroke, till its own steam valve, being opened by the motion of the other's piston rod, enables it to reciprocate. The combined and reciprocal action of the two double-acting plungers thus driven at unvarying piston speed by the combined pressures in the high and low-pressure steam cylinders (whose sum is a practically uniform quantity), forces the water in a steady, quiet stream, while the silent seating of the water valves by their own gravity through the equalisation of pressures in the water cylinder, takes place during the pause of each engine at the end of its stroke."

BEVEL BAND SAW.—At the Fair of the American Institute is shown a band-saw machine made to saw bevel as well as straight. This is effected by moving the upper wheel sideways, without even taking off the saw or stopping the machine. The table, which works on a slide, as perfectly level, and connected with a lever which again is connected with the upper sideways slide, being a radius from the center of lower shaft; the whole is moved by a screw.—*Sci. Am.*

THE ALLEN ENGINE.—We take the following brief note upon this steam engine from the *Scientific American's* report of the Fair of the American Institute, Oct. 1st:—"Indicator diagrams taken from this engine show that the exhaust and admission approximate very closely to perfection. The exhaust valves are upon the opposite side of the cylinder from the induction valves, and are operated independently by a rock shaft connected with the eccentric by means of a link. The link is attached directly to the bend of the eccentric, and also operates another rock shaft, which drives the induction valves. The valves are plain slides, and are all balanced. They run with the greatest ease. The end of the connecting rod which operates the rock shaft, belonging to the induction valve gear, plays in the slot of the eccentric as it is operated upon by the governor, making a variable cut-off of great simplicity and efficiency."

LENGTH OF BULLET THE MAIN POINT.—Mr. Whitworth, inventor of the gun which bears his name, in a recent letter to the London *Times* says "that in all discussions upon the performances of guns, it should be borne in mind "that the primary element of success in long range shooting is length of bullet, and not the method of loading. Methods of loading merely affect the rapidity with which guns can be fired; great range, accuracy and penetrating power being obtained by using the long bullet,—with the proper twist of rifling and the heaviest charge of powder the bore can consume,—and by no other means."
